CHLOROMYCETIN®

COMBATS MOST CLINICALLY IMPORTANT PATHOGENS

Acquired resistance seldom imposes restrictions on antimicrobial therapy when CHLOROMYCETIN (chloramphenicol, Parke-Davis) is selected to combat gram-negative pathogens involving enteric and adjacent structures of the urinary tract. The acknowledged effectiveness with which CHLOROMYCETIN suppresses highly invasive staphylococci[1-9] extends to persistently pathogenic coliforms.[6,10-15] Experience with mixed groups of Proteus species, for example, "...shows chloramphenicol to be the drug of choice against these bacilli..."[15]

CHLOROMYCETIN is a potent therapeutic agent and, because certain blood dyscrasias have been associated with its administration, it should not be used indiscriminately or for minor infections. Furthermore, as with certain other drugs, adequate blood studies should be made when the patient requires prolonged or intermittent therapy.

Adrestat® ORGANON

A COMPLETE SYSTEMIC HEMOSTAT

Adrestat complements surgical skill with effective hemostasis. It promotes retraction of severed capillary ends and reduces capillary bleeding and oozing; prevents or corrects abnormal capillary permeability and fragility; prevents delayed clotting time and bleeding due to hypoprothrombinemia. Yet Adrestat has no effect on the normal constituents and process of blood clotting.

AVAILABLE IN THREE DOSAGE FORMS:

ADRESTAT Capsules and Lozenges for pre- and post-operative use, each containing:

Adrenochrome Semicarbazone, 2.5 mg. (present as Carbazochrome Salicylate*, 65.0 mg.); Sodium Menadiol Diphosphate (Vitamin K Analogue), 5.0 mg.; Hesperidin, Purified, 50.0 mg.; Ascorbic Acid, 100.0 mg.

Capsules in bottles of 30; Lozenges in boxes of 20

ADRESTAT (F) 1-cc ampuls for use during surgery, each containing Adrenochrome Semicarbazone (present as Carbazochrome Salicylate*, 130.0 mg.)

Boxes of five 1-cc ampuls

*Pat. Nos. 2,581,850; 2,506,294

EPILEPSY

Samples of the electroencephalogram of patient taken before and during treatment with DIAMOX[1]

DIAMOX*

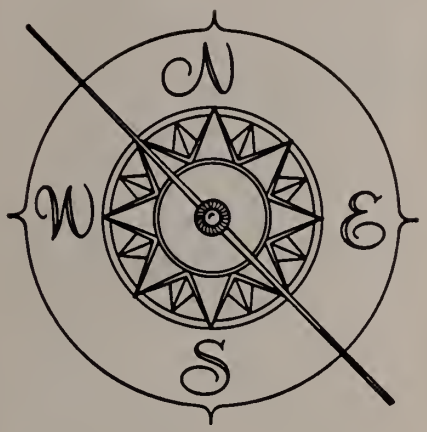
ACETAZOLAMIDE LEDERLE

Administered by mouth to 126 patients with various forms of epilepsy, many of whom were refractory to standard therapy, DIAMOX gave practically complete control of seizures in 34 cases, 90-99% reduction of seizures in an additional 12 cases, 50-90% in 22 cases, less than 50% in 58 cases. Diet was not restricted. *In at least half of the patients benefited,* DIAMOX *was used alone.*

In no cases was the condition made worse. No serious abnormalities of blood, urine, or bone were observed during treatment, *which was maintained over periods from three months to three years.*

Measures having a beneficial influence on epileptic seizures often involve certain drawbacks. In contrast, DIAMOX is simple to administer, has a wide margin of safety, produces a smaller systemic acidosis, has *an effect that is surprisingly well sustained.*

A highly versatile drug, DIAMOX has also proved singularly useful in other conditions, including cardiac edema, acute glaucoma, obesity, premenstrual tension, toxemias and edema of pregnancy.



Supplied: Scored tablets of 250 mg., syrup containing 250 mg. per 5 cc. teaspoonful.

multi-benefits of

LIPO-HEPIN* 200

sodium heparin U.S.P. aqueous

prolonged anticoagulant effect

Lipo-Hepin 200 – 20,000 U.S.P. Units (200 mgs.) per cc. – offers immediate effect (intravenously) and prolonged effect (fat tissue), without the disadvantages associated with gel heparin preparations.

ease of administration

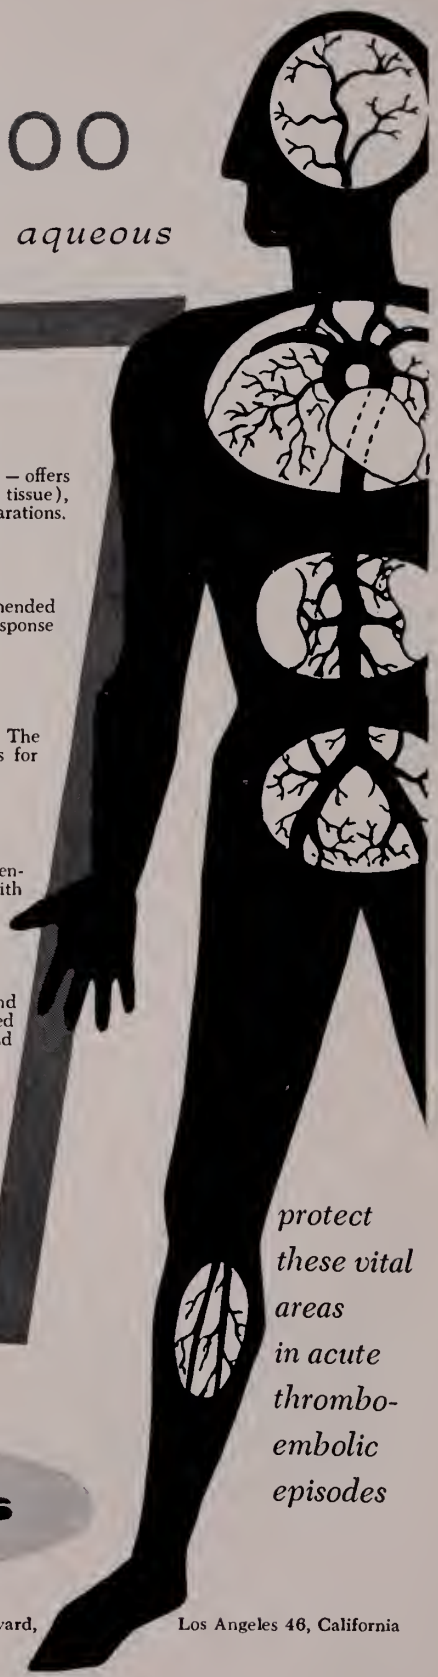
The high concentration of Lipo-Hepin 200, and the recommended dosage schedule, significantly lessens the patient-to-patient response variations.

ease of control

The action of Lipo-Hepin 200 is definite and predictable. The suggested 12 or 24 hour regimen allows convenient intervals for clotting times if desired.

optimum lipolysis

Lipoprotein lipase, as accentuated by Lipo-Hepin, allows prevention and correction of certain lipid accumulations associated with atherosclerotic disease.



economical therapeutic management

Immediate, positive and prolonged action . predictability and safety . . . anticoagulant and lipolytic effect . . significantly reduced patient cost. Lipo-Hepin is indicated for acute, convalescent and prophylactic therapy

availability

200, 100, 50, 10 mgs. per cc in various size vials.

like the orchid,

L. A. FORMULA

is still unsurpassed

L. A. FORMULA *normalizes* bowel function. It is equally effective in correcting simple constipation and non-specific diarrhea. It is ideal, therefore, in the Irritable Colon cases in which both constipation *and* diarrhea may occur.

L. A. FORMULA is a vegetable concentrate of naturally occurring hemicelluloses. It is derived from blond psyllium seed by our special Ultra-Pulverization Process and simultaneously dispersed in lactose and dextrose. It provides just the moist, smooth, effective bulk so essential to normal peristalsis.

L. A. FORMULA is not to be confused with the ordinary laxatives, neuromuscular stimulants, or mucosal irritants. They *exaggerate* peristaltic activity. L. A. FORMULA *normalizes* it.

L. A. FORMULA, furthermore, is undetectable in fruit juice or milk, pleasant tasting in water, and available in 7 and 14 ounce prescription containers at significantly lower cost-to-patient prices.

The Value of Blood Cholesterol Regulation

Studies[1-4] indicate that atherosclerosis is the underlying disease process in 80-90% of Americans who had myocardial infarction or angina with abnormal EKG patterns. It is also known that patients with coronary disease frequently have elevated blood cholesterol levels.

In these studies[1-4] patients with coronary occlusion "felt better" when their blood cholesterol was reduced by diet and a special cholesterol lowering formula. Anginal symptoms abated and none had a new coronary occlusion while on this therapy.

Patients with anginal attacks treated by Schroeder[5] with a high essential fatty acid and B_6 diet noted considerable lessening of anginal attacks.

Van Gasse and Miller[6] report marked pain relief by angina patients while on linoleic acid and B_6 medication. They recommend this formula for patients with high cholesterol levels, coronary thrombosis or angina.

(1) Lobecki, T. D.: Am. J. Clin. Nutrition 3: 132, 1955.
(2) Gertler, M. M., et al.: Circulation 2: 696, 1950.
(3) Gofman, J. W., et al.: Mod. Med. 21: 119, 1953.
(4) Barr, D. P., et al.: Am. J. Med. 11: 480, 1951.
(5) Schroeder, H. A.: J. Chronic Dis. 2: 28, 1955.
(6) Van Gasse, J. J., and Miller, R. F.: A.M.A. Meeting, New York, June 3-7, 1957.

The preponderance of evidence indicates that all persons who have elevated blood cholesterol (with or without clinical evidence of disease) . . . and all persons with a condition associated with atherosclerosis (even though blood cholesterol is normal) are candidates for a cholesterol regulation program.

ARCOFAC (Armour Cholesterol Lowering Factor) was specifically formulated to lower blood cholesterol with as little as 1 dose a day . . . and at the same time allow the patient to eat a palatable, balanced and nutritious diet. ARCOFAC is the first truly practical and effective method for lowering blood cholesterol levels.

Each tablespoonful of ARCOFAC emulsion contains:

Linoleic acid	6.8 Gm.
Vitamin B_6	0.6 mg.
Mixed tocopherols (vitamin E)	11.5 mg.

Bottles of 12 fluid ounces.

TUUMEST

The Romans had a word for it. "It's up to you," they said. The sage philosophy of the ages changes no more than does the value placed by mankind on the integrity of the individual. The keen insight of a discerning generation can be measured by the interest and care it places in the integrity of its members. Alcoholism is an insidious disease, seeking to destroy its victims. The extent of its damage is just now being appreciated by the medical profession and the public. But the interest generated in no way approaches the measure of care required.

Full appreciation of such a problem can come only with time. And only time will yield the funds necessary to equalize and overcome the cost burden placed upon society by the ravages of this disease. But, first and foremost, you the physician have the opportunity to perform a service for your patients — and society. You can perform that service by recognizing the problem and then seeking the best possible care for it. *Tuum est* — It's up to you.

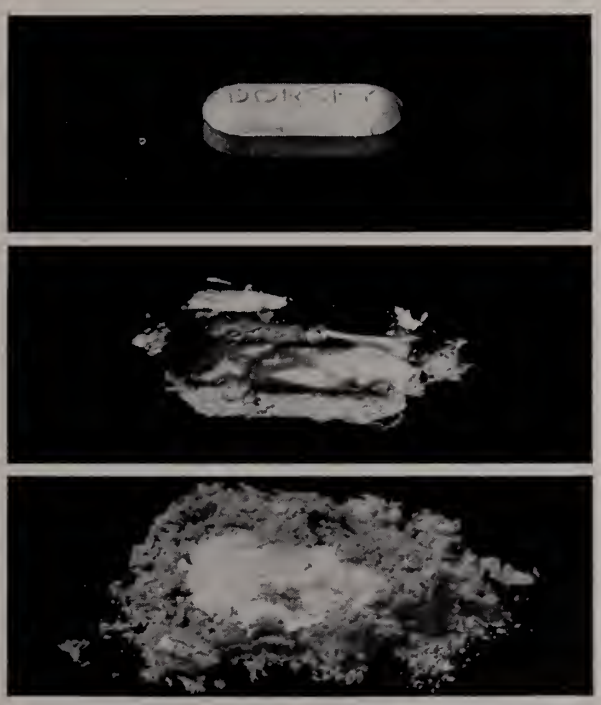
Consistent Gains in Functional Capacity Can Be Achieved with Conservative Therapy

The unemployable arthritic once again may undertake full employment and normal recreation. Patients once confined to the home or wheel chair often find it possible to engage in light work. And even bedridden patients can walk with comfort again. These are the benefits of conservative therapy as demonstrated in long-term studies.[1,2,3] In fact, in these four-year comparative studies of salicylate and cortisone, the corticoid showed no superiority over conservative therapy.

Superior Conservative Therapy Provided by Buffered Pabirin

Buffered Pabirin epitomizes modern, conservative therapy without the serious complications of corticoid therapy. Adrenal atrophy, peptic ulcers, moon-face, hypertension or psychotic reactions, a constant risk whenever corticoids are used,[4-7] will not occur with Buffered Pabirin. Month after month, Buffered Pabirin can be administered with a minimum of problems to patient and physician, and without the side effects common to the use of salicylates alone.



Buffered Pabirin combines new form and formulation for faster pain relief, improved gastric tolerance

Each tablet of Buffered Pabirin consists of an outer layer containing a buffer (aluminum hydroxide), para-aminobenzoic acid and ascorbic acid; an inner core of aspirin. The outer layer quickly releases aluminum hydroxide which affords superior buffering action and protects against gastric irritation. The core of Buffered Pabirin then disintegrates rapidly, permitting fast absorption of acetylsalicylic acid. PABA potentiates the acetylsalicylic acid and creates high salicylate blood levels. Ascorbic acid counteracts vitamin C depletion.

The new form and formulation of Buffered Pabirin provides high and sustained salicylate blood levels. It may be administered over long periods of time without the nausea, dyspepsia or other gastrointestinal symptoms so frequently experienced with salicylates alone.

in osteoarthritis, gouty arthritis, rheumatoid arthritis, bursitis, fibrositis, or tendinitis

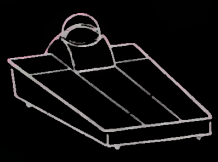
a new drug that...

has been clinically tested in
over 4900 cases of overweight

LEVONOR



brand of 1-phenyl-2-aminopropane alginate · Nordmark

acts specifically on
the hunger syndrome

can be given at
8 p.m. or later without
interfering with sleep

produces an average
weight loss of
2-2½ lbs. per week [1]

clinically tested . . .

by more than 700 physicians in over 4900 cases of overweight in selected University Hospitals and Clinics as well as in private practice.[2]

not a CNS stimulant . . .

unlike *d*-amphetamine, LEVONOR is not a central nervous system stimulant, but is an *anorexigenic specific* that does not cause "jitters," tenseness, or nervousness. Can be given after dinner... AT 8 P.M. OR LATER . . . to allay night-time hunger without disturbing sleep.[3]

safe . . .

"5 times safer (LD/50) than *d*-amphetamine"[4] . . . strikingly free of side-effects.

effective . . .

produces an average weight loss of 2-2½ lbs. per week.

suggested dosage schedule . . .

clinicians have found LEVONOR particularly well suited to a dosage schedule of one tablet three times a day . . . at 11 a.m., 4 p.m., and 8 p.m. Some patients, especially those who have previously been treated with *d*-amphetamine, may require a temporary initial dosage of two tablets three times a day. LEVONOR offers the lattitude necessary to adjust dosage to the needs of individual patients.

available . . .

in bottles of 100 tablets, each tablet containing 5 mg. of 1-phenyl-2-aminopropane alginate.

Trust

Prepayment schemes seem important to the medical profession today and undoubtedly they are important to many other groups composing modern society. Papers presented at the meeting of Western Conference of Prepaid Medical Service Plans at Portland last November, and published elsewhere in this issue, attest to the importance. Thoughtful readers of these messages may learn much about what is happening within prepayment organizations and what we may expect in the future. There may be some misgivings.

One of the most disturbing factors is the evidence that those who engage in the business of selling prepayment plans, and many of those from without the profession who try to discuss them, are thinking about medical care minus the profoundly important principle of trust. Some physicians understand it but some do not. Some physicians try to practice medicine as a science; some use science as a tool in applying their art. Understanding of the principle of trust, or even recognition that such an attitude can play a part in preventing or curing illness, can hardly be expected from one who has never experienced the great satisfaction which comes with its employment in healing. One trained only in the market place might be expected to find satisfaction in neat dollar labels on everything or in columns of figures representing numbers of people enrolled. It may be unfortunate that those trained in commerce, and even those physicians who are skilled in business dealings, seem to be able to communicate their manner of thinking to others. Thus people become punch marks on an IBM card and medical care becomes a commodity. The two are balanced in electronic machines and the business man is happy if the answer shows financial solvency of the scheme.

Hawking medical care as a commodity may not be all bad. There is no doubt that it has brought more people into more medical offices, much as has the socialistic scheme in England, but that is hardly an unmixed blessing. It has its defects, one of which is illuminated by the wails of those in medical commerce about over-utilization. Avowed purpose of the schemes is to provide more medical care for subscribers but when they demand what they have been promised, the holes in the punch cards and the dollars paid out do not always make comfortable reading for plan administrators. But that is not the point.

The most important point, and the one so easily overlooked is that commercialized medicine, while often adequate, can never be superior. The *best* medical care is rendered when there is personal relationship between physician and patient which provides the best possible opportunity for the patient to achieve his desired goal in health. That is the kind of relationship that cannot be punched into a card or tabulated in dollars but it is just as real as an electrocardiogram or a sedimentation rate.

Perhaps a case observation might illustrate the point. Several years ago an elderly gentleman was admitted to an Eastern hospital for nephrectomy. When the resident made rounds the evening of admission, he made mental note of the fact that the patient did not display the concern which might be expected of one confronted with

such serious surgery. The next morning he had a nephrectomy and that evening, when the resident made rounds, the patient was reading the paper, with no evidence that he had undergone a truly major procedure. It took the resident some time to understand that patient. It finally dawned on him that, for the first time, he had seen a patient go through surgery without fear. It had been possible because his surgeon was an old and trusted friend in whom his confidence was absolute. The surgeon had operated on him before. His surgical ordeal consisted of a brief sleep under anesthesia and a little inconvenient pain in the side, nothing more. Those who understand the real nature of the art of medicine will realize that the pinnacle of that art was achieved by the surgeon in the case. He delivered the commodity represented by gentle, expeditious surgery but that was only something he did to the patient's flank. What he delivered to the patient was more significant but, to some, a little more difficult to understand. It was the creation of a peculiarly personal relationship, deeply satisfying to both, which permitted the patient to undergo his surgery without fear.

Mr. Sprague, in his paper, said that there was considerable myth in the confidence of the patient in his physician. The statement reveals that he too understands medical care only as a commodity and that he is entirely unaware of the very profound effect of *complete* confidence of the patient in his physician. Dr. Raider, in his plea for support of the Blue Shield plans, talks of competition, the tendency of an employer to seek cheaper coverage and the dollar inequality of groups. His concern is not the practice of medicine but only the balance between dollars and holes in the punch cards. Dr. Layton comes closer to an understanding of the creed of medicine. He knows that the doctor in the Luke Field painting had a kind of skill for which there is no price, which cannot be sold in neatly labeled packages. He understands the motivation of the dedicated physician and his natural resentment against the encroachment of business economics upon the time which he would prefer to devote to the patients who need him.

Perusal of the papers given at the Portland meeting should give any physician in practice a better understanding of prepayment, what it is, what it plans to be and how the people in prepayment think about the practice of medicine.

The Forand Bill

H. R. 9467, now known as the Forand Bill, was introduced in the first session of the 85th Congress by Representative Forand (D, R. I.). It would amend the Social Security Act to provide medical, surgical and hospital benefits to beneficiaries of the Act. Number of persons who would be eligible for medical and hospital care by the government is estimated at 12 to 13 million.

Cost of hospital care for 60 days in any one year would be paid from the Social Security Trust Fund. Nursing home care also would be provided to combined total of 120 days in any twelve month period. Surgical treatment would be provided with the surgeon being paid from the Old Age and Survivors Trust Fund. The surgeon, however, would be required to hold certificate of the American Board of Surgery or be a member of the American College of Surgeons. Physicians rendering non-surgical service would be paid according to regulations established by the Secretary of Health, Education and Welfare.

Medical benefits under the Forand Bill would be in addition to benefits otherwise provided. Maximum cash benefits, now $108.50 for individuals, would be increased to $151.80. Benefits for families would go from maximum of $200 to $305. Present base for taxation is limited at the first $4,200 earned. The Forand Bill would extend this limit to $6,000. Present rate for employer and employee would be increased 0.5 per cent in 1959. Taxes on earnings of the self employed would be increased 0.75 per cent. By 1975 the tax rate for employed persons would be 9.5 per cent and that for self employed persons 7.125 per cent.

This proposal to extend the social security sys-

tem should not be particularly surprising. Specific items in the Forand Bill may not have been included in the schemes of those who first promoted social security legislation but exactly this type of growth was contemplated before the project was launched. Like most proposals calculated to increase government control over the lives of citizens, it has understandable appeal. It seems to make security a little bit more secure. Many, including some physicians, will consider it a good thing. This reaction was well understood by those who made the original plans and it is being counted on by those in charge of the expansion. It is an important block in the foundation upon which they would erect a more and more powerful central government.

It should not be difficult, however, to see just what is happening in the age-old struggle of individual versus government. History of this conflict is circular and the full three hundred sixty degrees have been traveled many times. We are not yet one hundred eighty degrees from 1776 but we are getting there, step by step. The Forand Bill can be recognized readily as proposal to take a significant stride along the arc.

David Allman, President of the American Medical Association, had something to say about the Forand Bill when he addressed the House of Delegates at Philadelphia last month:

> This *is* Socialized Medicine. This is Oscar Ewing's National Compulsory Health Insurance all over again. A decade later perhaps and for a limited number of people but it is "cut from the same cloth" and, I am sure, emanates from the same minds.
>
> It *is* the beginning of the end of the private practice of medicine.
>
> It *is* the death knell for the young, and growing voluntary health insurance industry.
>
> It *is* a serious threat to the well being and local autonomy of the voluntary hospital at the community level.
>
> It *is* Socialism under the auspices of the federal government.
>
> Gentlemen, I submit that this bill is at least nine parts evil to one part sincerity!
>
> For 35 years I practiced surgery, and never once did I operate without first making a full diagnosis of the case. Furthermore, none of you prescribes therapy without an adequate diagnosis. This is the way good medicine has been practiced.
>
> Now along comes a new concept. A solution to a problem without first ascertaining its true scope. In short, prescribing treatment without a diagnosis about (1) the economic resources of our older population, (2) the present and planned programs of voluntary insurers, (3) indigent care at the state level, (4) the incidence of hospitalization and illness by age groups, and other complex research questions.
>
> This procedure may be an advance in the field of vote-getting, but it would be a complete failure in medical and surgical practice.

American Medical Research Foundation

Raymond M. McKeown of Oregon, James Appel of Pennsylvania and Julian Price of South Carolina, all members of the Board of Trustees of American Medical Association, were appointed last June to make special study leading to establishment of a research foundation. This committee brought in a favorable report together with suggested charter and bylaws. Plans were approved by the Board of Trustees and the American Medical Research Foundation was incorporated under the laws of Illinois, September 5, 1957. Board of Directors of the new organization includes Drs. McKeown, Appel and Price with the addition of Leonard Larson of North Dakota and Hugh H. Hussey, Jr. of the District of Columbia.

The Foundation will promote betterment of public health through research, plan scientific and research activities, collect results and transmit them to the public after evaluation, and will maintain a library.

The Board of Trustees voted contribution of $10,000 to the new Foundation for the year 1957. Funds will be augmented by contributions from individuals, corporations, industry or other foundations. Research not otherwise supportable by AMA, or other organizations or individuals alone, will be made possible by the Foundation.

key to oral penicillin effectiveness

V-CILLIN K

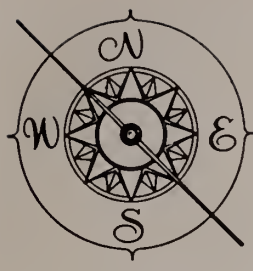
(Penicillin V Potassium, Lilly)

stability plus solubility provides greater absorption

—twice as much absorption of penicillin as from buffered potassium penicillin G given orally.

A greater total penicillemia is produced by 250 mg. of 'V-Cillin K' t.i.d. than by 600,000 units daily of intramuscular procaine penicillin G. Also, high serum levels are attained more quickly with this new oral penicillin.

These unique advantages of 'V-Cillin K' assure maximum penicillin effectiveness, and dependable therapy, for penicillin-sensitive infections.



Scored tablets of 125 and 250 mg. (200,000 and 400,000 units).

Nipple Secretion in the Non-Lactating Breast

Ausey H. Robnett, M.D.
Milton W. Durham, M.D.
and
Harry P. Harper, M.D.
Spokane, Washington

Hyperlastic discharge in the absence of a mass in the breast obligates the physician to determine its source.

Abnormal discharge from any orifice of the body is a warning signal of altered metabolism or altered structure, which may be potentially lethal. This is as true of the non-puerperal nipple discharge as of intermenstrual or post-menopausal vaginal bleeding.

In the presence of a palpable mass, the nipple discharge is of secondary importance, for biopsy is indicated and establishes diagnosis. In the absence of a palpable mass, however, the character of the nipple discharge is of importance to diagnosis and therapy. The gross nature of the discharge and its source from single or multiple ducts is of importance. Microscopic examination using cellular stains will reveal the presence or absence of erythrocytes and tumor cells.

Approximately 8 per cent of patients with mammary complaints have nipple discharge.[1,2] Grossly, the discharge may be bloody, serous, milky, green, brown, or a combination of these types. From 80 to 90 per cent of discharges from the non-puerperal, non-lactating breast in adults are due to intraductal papilloma, cancer, or fibrocystic change.[1] Unusual causes are trauma, sarcoma, vicarious menstruation, chancre, and inflammatory states.[3]

The discharge may be classified as either stagnation or hyperplastic.

Stagnation discharge is the result of cyclical stimulation or acinar cells with exfoliation of cells into the duct system. Grossly the discharge is white or yellow and is not bloody. With pseudomonas or staphylococcus contamination, the color is green or brown. Often the discharge

Fig. 1. Stagnation discharge. Normal duct epithelium, protein precipitate, and lymphocytes (x44).

Read at the 20th Annual Meeting of the Spokane Surgical Society, Spokane, Washington, April 6, 1957.

appears from multiple ducts and frequently is bilateral. Microscopically (Fig. 1) present are desquamated, degenerated epithelial cells, lymphocytes, mucus, and protein precipitates. The stagnation type of discharge is most characteristic of fibrocystic change. Malignancy is seldom, if ever, the cause of the stagnation type of discharge. The presence of the stagnation type of discharge without palpable mass permits the physician to reassure the patient and recommend periodic examination of the breast.

STAGNATION DISCHARGE

Gross - White, yellow, green, not bloody

Microscopic -
- Degenerated epithelial cells
- Colostrum cells
- Lymphocytes
- Mucus
- Protein precipitates

Hyperplastic discharge, as the term indicates, is the result of cellular hyperplasia. It may occur with intraductal papilloma, intraductal adenoma, and carcinoma. Often localized to a single duct, the hyperplastic discharge is serous or bloody. Microscopically, it is found to contain erythrocytes, epithelium, lymphocytes, and tumor cells. A discharge which is not bloody grossly, however, may contain red blood cells microscopically and must therefore be classified as hyperplastic. Adair[4] reported in a study of 108 patients with a serous or serosanguineous discharge, that the discharge was due to malignancy in 47.2 per cent and to a benign lesion in 52.8 per cent. Similar distribution has been reported by Donnelly[1] and Macdonald.[3] These figures included patients with a mass as well as without a mass. In the absence of a palpable mass the incidence of malignancy associated with a hyperplastic discharge is 9 per cent, or roughly one out of ten.[5]

HYPERPLASTIC DISCHARGE

Gross - Serous to serosanguinous

Microscopic -
- Erythrocytes
- Epithelium
- Tumor Cells
- Lymphocytes

Given, then, hyperplastic discharge in the absence of a mass, the physician is obligated to determine the source of the discharge. Gentle radial compression of the circumareolar breast tissue will result usually in the appearance of the discharge from one of the twenty ducts normally present in the nipple. If the single duct is identified, it may be cannulated with a small lachrymal duct probe, split, and followed to the periphery of the breast, until the source is determined.

If no source is grossly apparent, the duct with adjacent breast tissue should be excised as a biopsy for microscopic examination. If the source of the discharge is carcinoma, radical mastectomy is indicated. If, however, the source of the discharge is an intraductal papilloma, local excision is indicated, although there is dis-

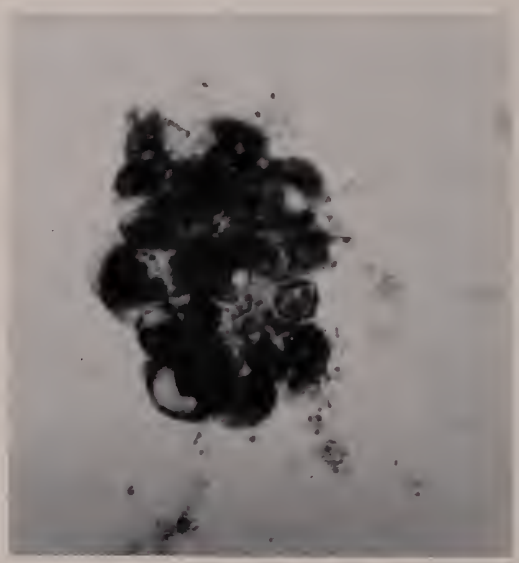

Fig. 2. Hyperplastic discharge with clumps of ductal epithelial cells and erythrocytes (x44).

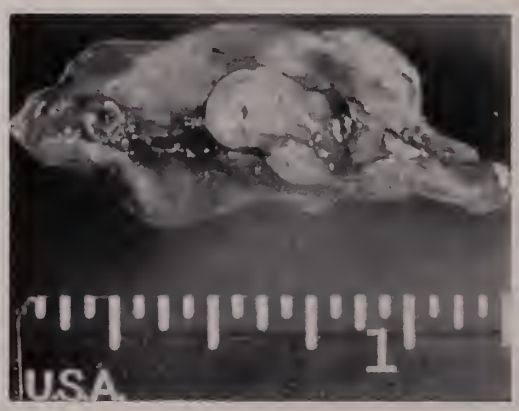

Fig. 3. Intraductal papilloma, benign.

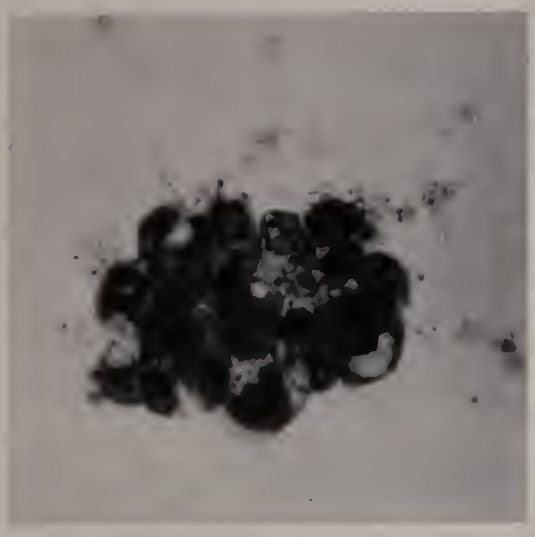

Fig. 4. Bloody discharge—atypical cells suggestive of carcinoma (x44). Biopsy revealed intraductal carcinoma.

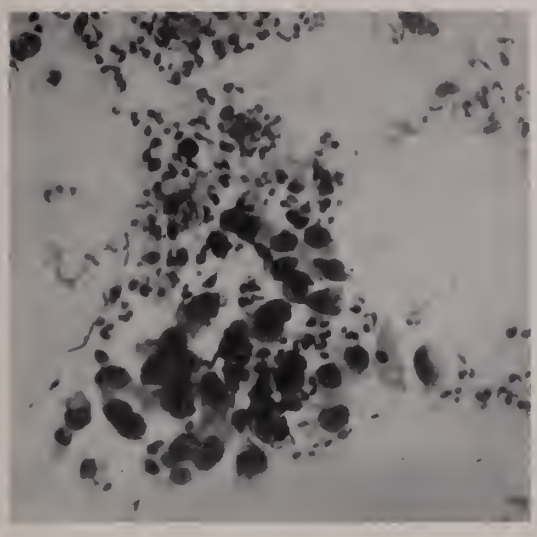

Fig. 5. Ulcerated nipple—atypical cells suggestive of malignancy (x44). Biopsy revealed intraductal carcinoma.

agreement by some who advocate simple mastectomy.[6]

Intraductal papilloma, which is a common source of the serous or bloody hyperplastic discharge, is a benign lesion (Figs. 2, 3) and must be differentiated from intraductal papillomatosis, or diffuse papillary proliferation which should lead one to suspect papillary carcinoma. Estes[6] concludes that the intraductal papilloma is multiple in 15 to 30 per cent and simple mastectomy should be done. Haagensen,[7] however, believes that the true intraductal papilloma is rarely multiple and in 76 patients whom he treated by local excision, 5 developed other intraductal papilloma, but none has developed carcinoma over a five and ten year period.

Diffuse papillomatosis necessitates careful evaluation with multiple sections to exclude multicentric microscopic foci of papillary carcinoma. The decision to perform mastectomy should await study of permanent sections and consultation with the pathologist. Study of nipple secretion may disclose the presence of atypical cells compatible with carcinoma indicating the presence of intraductal carcinoma (Fig. 4).

Paget's disease is also a source of hyperplastic nipple discharge and in smears can be recognized tumor cells (Fig. 5) not seen in eczema of the nipple. Simple punch biopsy will establish the diagnosis of intraductal carcinoma.

Summary

1. Nipple discharge in the non-lactating breast is a sign of breast disease.

2. In the absence of a mass, gross and microscopic study of the discharge may reveal the presence of tumor cells. Source and etiology of the discharge must be found.

3. Stagnation type of discharge is found in fibrocystic changes in the breast.

4. Hyperplastic discharge, serous or bloody, is commonly caused by intraductal papilloma or carcinoma in approximately equal percentage.

5. Intraductal papilloma is a benign lesion and may be treated by local excision. Papillomatosis, however, should be regarded as a pre-malignant lesion and microscopic foci of papillary carcinoma should be sought.

Intravascular Gas in Fetal Death

WILLIAM S. JUDY, JR., M.D.
GRANTS PASS, OREGON

Purpose of this paper is to review briefly the Roentgen signs of fetal death, with emphasis on the demonstration of gas within the fetal circulation as pathognomonic of death.

The usual signs suggestive of fetal death are as follows.

1. Overriding of the skull bones with cephalic asymmetry.[1] Fahmy[2] has recorded these changes in the living fetus.
2. Marked angulation of the fetal spine (Szellö).[3] This is usually characterized by hyperextension.
3. Lack of correlation between fetal bone size and duration of pregnancy.
4. Stationary fetal position in serial examation.
5. Haziness of contours or absence of bony structures in serial examinations.

All of the above signs however have been

The film shown above has been retouched to emphasize shape and location of radiolucent areas. They were well recorded on the roentgenogram but contrast was too low for proper reproduction on the press. Ed.

demonstrated in live fetuses, and it is estimated that they do not become evident until one to two weeks following fetal death.

Gas in the fetal circulatory system was first demonstrated by Roberts[4] in 1944, who diagnosed one case before delivery and demonstrated the gas in one stillborn. Sporadic reports have filtered through the literature since that time, with approximately 48 cases now having been recorded. It should be emphasized however that this is a common phenomenon, and is frequently demonstrated by good film technique in fetal death. Crick and Sims[5] report the sign in 12 of 23 cases where x-ray studies were done prior to delivery of stillborns, and Holm[6] showed the gas in 13 of 18 cases, including post-partum studies.

Examination of the fetuses where delivery occurred within a few hours following the roentgenograms showed that 80 per cent had been dead less than 5 days and only 20 per cent for longer periods. This was determined roughly by the degree of maceration (grading of maceration after Martius).

The importance and frequency of this sign may not have been realized earlier because few requests for this examination are made. Obstetricians have found that by the time roentgenologic signs are definite, there is little doubt left clinically.

Correct film technique is essential to demonstrate the gas. A lateral film utilizing a wedge filter is the most important single view. A horizontal beam to demonstrate gas-fluid levels may be helpful.

In all reported instances the gas was situated in the heart, aorta, or some of the major arteries. In several cases there also was gas in the inferior vena cava and umbilical vessels.

Analysis of the gas has been reported by different investigators as nitrogen, oxygen and carbon dioxide. It is not definitely known how the gas is formed. Davidson[7] considered the gas due to decomposition of some blood element. Samuel and Gunn[8] believed that the gas developes in the living fetus, and that fetal death is secondary to intra-cardiac gas embolism. Holm stated that chemically combined oxygen and carbon dioxide are liberated from decomposing hemoglobin and gave cogent reasons for his belief. This seems the most probable explanation, for the time being.

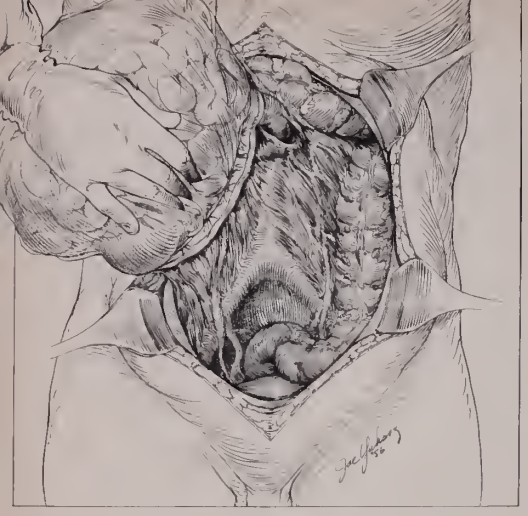
CASE REPORT

A 28 year old white female, gravida 4, para 2, was referred for fetal roentgenograms to evaluate possible fetal death. The patient stated that she had felt fetal movements until 24 hours previously. Fetal heart tones had not been heard definitely for the preceding six days. The patient had two living children, one 9 years old and the other 6 years old. She had a premature delivery January 1955 of a stillborn infant. Her blood type was 0, Rh negative. The anti-Rh titre had been rising for the last two months of this pregnancy.

Roentgenograms revealed a single fetus whose size conformed to approximately eight months gestation. The abdominal arteries and umbilical vessels were well outlined by air. The fetal position was normal and there was no overlap of the skull bones.

The patient spontaneously delivered a stillborn fetus 24 hours later, the fetus showing moderate hydrops and maceration. Death was estimated to have occurred four to five days previously.

Summary



1. Gas in the fetal circulatory system is pathognomonic of fetal death.

2. A review of the literature suggests that this sign occurs early and is a relatively common finding when sought.

Exposure in Abdominal Surgery

Rex L. Ross, M.D.
LOS ANGELES, CALIFORNIA

One of the chief problems of exposure in the abdomen, especially in obese individuals, is isolation of small bowel from the operative field. The problem becomes greater when one needs free exposure over considerable distance. It is always difficult to successfully pack small bowel out of the operative field and keep it isolated. The mass of small intestine, plus the heavy packing sponges, fill such a large part of the abdominal cavity that often there is little room left for exposure of the area desired.

Isolation of the bowel can be achieved by use of a bag made of plastic material known as vinyl film. It is tough, durable, and may be autoclaved at the same temperature as rubber gloves without losing its softness, color, transparency or pliability, or deteriorating in any way. These bags are made by folding a sheet of vinyl film to the desired size and sewing the edges on a machine after applying a small strip of binding tape for strengthening. The bag which has been employed measures 18 inches in length and 16 inches in width. The large opening of the mouth of the bag can be narrowed by loose ties which are sewn into place on one edge of the opening.

The vinyl film material may be purchased directly from the manufacturers or by its brand name from local dime stores.*

It is sometimes necessary to free the lateral attachments of the cecum in order to include all the small intestine from the terminal ileum to the ligament of Treitz. The mouth of the bag can be narrowed with the tie, but without constriction, and the whole mass of bowel thrown up over the abdominal wall. A sponge moistened in warm saline is first inserted in the bag, previously autoclaved, and the bowel placed on this warm saline pack. With the bowel completely mobilized onto the abdominal wall, the posterior abdomen is exposed widely for any surgical procedure which may be necessary.

The maneuver is especially valuable, for instance, in approaches to the abdominal aorta and iliac vessels for aortic arterial grafting, or thrombo-endarterectomy, or for bilateral transabdominal sympathectomy, which one may want to employ as an adjunct to other surgery. The exposure is excellent from the level of the ligament of Treitz to the pelvis. The method is applicable to surgery of the left colon, where the necessity of packing away loops of small bowel may be annoying, especially in obese individuals.

Use of the plastic bag also minimizes handling and trauma to the bowel. It decreases the cooling effect of prolonged exposure which tends to be more shocking to the patient and is conducive to development of paralytic ileus.

One must be careful, when the bowel has been laid up on the abdominal wall, that the assistants do not inadvertently lean against, or put pressure upon the extruded bowel, or traumatize it by forceful retraction against the mesentery.

Use of these bags is of great value in certain cases in which exposure by other means is difficult. They protect the bowel, provide easy posterior abdominal exposure with the small bowel isolated, are inexpensive, are easy to prepare and they may be autoclaved without being damaged.

Carcinoma of Fallopian Tube

Richard D. Simonton, M.D.
Boise, Idaho

Orthmann is credited with first describing carcinoma of the fallopian tube in 1888. Since that time approximately six hundred cases have been reported.[1] Primary malignancy of the fallopian tube is the rarest of the pelvic neoplasms and also the most malignant. Prognosis is extremely poor, less than 5 per cent of the cases being reported as a five year cure. Patient age varies from 18 to 80 with the greatest incidence falling in the forty-fifth to the sixty-fifth year. Its incidence has been reported variously as being between 0.1 and 0.5 per cent of pelvic neoplasm.

Pre-operative diagnosis is difficult and seldom made. The most frequently encountered symptoms are: 1. pelvic pain, 2. intermittent vaginal bleeding or gush of fluid and 3. palpable adnexal mass. Pain as a symptom occurs much earlier than in any other pelvic neoplasm. Pelvic pain may vary in intensity and extent. At times it will be lancinating in type, acute and referred to the lumbar areas. It is usually located on the side of the involvement. Sudden distension of the tube by fluid is thought to be the cause for this lancinating type of pain. At other times it may be a continuing dull discomfort, generalized and constant. Vaginal bleeding is usually spotty and at infrequent intervals. Sudden gushes of watery or serosanguineous fluid occurring intermittently may be the most suggestive signs. Martzloff has postulated that postmenopausal bleeding associated with negative cervical and endometrial findings is suggestive of tubal carcinoma.[2] Vaginal smear is being recognized as an additional diagnostic aid.

Approximately one-third of these neoplasms are bilateral. The most frequent site of tumor origin is in the distal two-thirds of the tube. Early closing of the fimbria accounts for the discharge through the vagina. Metastasis is by lymph or vascular channels, continuity or transperitoneal migration. Microscopically, the neoplasm is adrenocarcinomatous in type which is further subdivided into papillary, adenomatous and medullary types.

Total hysterectomy with bilateral salpingo-oophorectomy is accepted treatment. Use of postoperative Roentgen therapy is of questionable value.

Read at the semi-annual meeting of the Boise Valley Chapter, American College of Surgeons, May 25, 1957.

CASE REPORT

A housewife, age 61, was first examined on April 18, 1940. Her complaint was vaginal spotting, soreness through the lower abdomen, constipation and some sciatic and back pain. She had been married at age 19, had had two normal pregnancies and deliveries. Her menstrual periods were always heavy with slight pain. Because of excessive flow, at the age of 49 she had had intrauterine radium treatments. The radium reaction was immediate. All flow stopped within a month. Menopausal symptoms were very mild. After the radium treatment she had been entirely well until five months prior to examination, at which time she noted spotting on voiding. Three weeks later she had a second show which lasted for two or three days. There was show of one to two days during each of the three months immediately preceding examination but only enough to be noticed on voiding or to produce very slight stain on her clothing. There was no vaginal discharge or odor. Soreness in the lower abdomen was noted in conjunction with the spotting and was accentuated by being on her feet. She stated that constipation had been a constant complaint.

Family history contained no reference to malignancy and her past health, otherwise, had been without note.

Physical examination revealed an elderly white female, 62 inches in height, 135¾ pounds in weight. Blood pressure was 116/70, pulse 80, temperature 98.2. Abdomen did not reveal any masses or enlargements although there was indistinct sensitivity in both lower quadrants. Pelvic examination revealed normal external genitalia, moderate atrophy of the vagina with shortening, and a uterus that was two-thirds normal size, smooth and regular. The cervical os was open and showed no abnormal discharge or color. There was moderate tenderness behind the cervix and in both fornices. The tubes and ovaries were not palpable. There were small asymptomatic hemorrhoids. Extremities were normal with the exception of slight varicosities of both lower legs. Laboratory examination showed moderate hyperchromic anemia.

Since no organic lesion was demonstrated on examination, curettage was advised. It was done April 22, 1940. Pathologic report described fibrin, blood and a few atrophic endometrial cells. At the time of the curettage there were several small fissures in the mucocutaneous line in the posterior opening of the vagina. Manipulation during procedure had produced slight stain in this area. With this demonstrated possible source of bleeding and negative findings, the patient was dismissed from the hospital, given treatment to reduce vaginal irritation and directed to report back should the spotting again present itself.

Patient remained free of spotting until April, 1941. She reported to the office the day she noticed the spotting. On pelvic examination blood was found in the cervical os. Pelvic examination revealed no change in the uterus, and the tubes and ovaries were not palpable. There was no increase in tenderness during the pelvic examination. The patient was again advised that the mucosa of the uterus should be examined and if not within normal limits, the abdomen should be opened so that the pelvic organs could be thoroughly inspected.

Curettage, followed by laparotomy, was done April 16, 1941.

The uterine scrapings again were not suggestive of malignancy. It was with some hesitation that the patient's abdomen was opened. Examination revealed the uterus to be atrophic, smooth and moderately firm. The ovaries appeared to be completely atrophic. The distal end of the right tube, however, contained a firm, whitish, nodular mass 3 cm. in length and 1.5 cm. in diameter, closing the fimbriated end of the tube. Both tubes were lying free in the abdomen. No lymph nodes were palpable but there were several white, pin head sized elevated nodules on the pelvic peritoneal surface and the posterior of the uterus. Total hystero-salpingo-oopherectomy was performed with wide ligation of the uterine vessels and removal of a large portion of the vaginal vault immediately surrounding the cervix. The whitish nodules on the peritonium were excised widely.

Pathologic report was as follows: "The curettings consist of mucus and blood. Uterus 5x7x2 cm. with tubes 6 cm. in length and ovaries 2x1x1 cm. attached. The end of one tube is enlarged 3x2x2 cm. The fimbriated end is closed. The tube cuts readily. The cut surface is pinkish white. The ovaries are fibrous. The uterus cuts with increased resistance. There is a stricture at the junction of the cervix and body of the uterus with papillary growths along this stricture. The vessels stand out from the cut surface. Sections through the tube show the lumen filled with epithelial cells supported on a delicate connective tissue stroma. These cells have invaded the musculature, and their nuclei show change in size and polychromatophilia and many mitotic figures. There is some hemorrhage throughout sections through the cervix which show areas of dense connective tissue throughout the musculature. There are outgrowths of connective tissue.

"Diagnosis: Papillary adeno-carcinoma of tube. Stricture and fibrosis of cervix."

Postoperative convalescence was without complications and patient received deep x-ray therapy to tolerance before leaving hospital.

The patient left the hospital on the thirty-first day. She remained well following this procedure until June 7, 1942 at which time she complained of some bladder distress and a return of tenderness in the lower abdomen. Examination revealed some increased fullness of the right pelvic area. Examination July 7, 1942 revealed quite a marked increase in fullness in this area and suspicion of a recurrence of her malignancy was confirmed. Patient expired October 12, 1942, from general abdominal metastasis of the malignant process.

Summary

In summary, may I point out that the symptomatology and usual clinical findings of tubal carcinoma are much more obscure and misleading than in the more frequently occurring pelvic malignancies. Pain and pelvic tenderness are the rule in early findings, suggesting inflammatory disease. Spotting is illusive and seldom can be demonstrated on examination. Coupled with a negative pathologic report of curettings, this can give a false sense of security. Recently, vaginal smear has suggested malignancy in these confusing cases. Such a report has led to early operation. Only through thorough understanding can these cases come to early diagnosis and treatment, and only through early treatment can the cure rate be improved.

Aspects of Salt Fluoridation

Gunnar Santesson, M.D.
STOCKHOLM, SWEDEN

Salt fluoridation as a method of controlling dental decay has been suggested for rural areas where water fluoridation is not feasible,[1] and might be put forward in communities where water fluoridation is not practicable[2,3] or accepted by city or borough councils.

There are a number of circumstances suggesting the usefulness of salt fluoridation. In the first place, fluoridated salt can reach the consumer in rural areas where, for instance, some 50 per cent of Sweden's population is found.[4] Further, this type of salt would give the population a supplement of fluorine to the diet in the same automatic way as fluoridated water would. At the same time the fluoride intake would not be compulsory; any individuals—such as members of families without children, elderly and diseased persons—wishing to use non-fluoridated table or household salt could do so. This form of mass prophylaxis allows a margin for individual desires and exemption. In Sweden, von Euler, adviser to the Royal Medical Board, has recently stressed this important point.[5] Salt as a fluoride vehicle would give a safer guarantee against fluorine overdosing than water. State and community would not be burdened with costs of any importance for a fluorine prophylaxis of this kind. The cost of fluoride added to salt would be negligible as compared with the cost of fluoride added to water. Sodium fluoride addition to the Stockholm water would cost close on 300,000 Swedish crowns per annum,[6] operation costs not included—quite an appreciable item in the community budget.

Production of a well-balanced fluoridated salt is fairly simple. In contrast to the many local plants needed for water-fluoridation, salt for household use in 1 kg. packets containing 100 mg. fluorine per kilogram of salt can be produced with great accuracy for a whole country like Sweden at one single or, at most, a couple of factories. Continuous routine analysis and technical control are thereby reduced to a minimum. The character and content of the salt can be clearly specified on the salt packet (Fig. 1).

Fig. 1. Type and text of salt packet in use in Aargau, Switzerland.

That fluoridated salt can be successfully distributed in territories in which some communities already have a concentration of natural fluorine above 0.6 ppm in the drinking water, is shown in practice in the Swiss cantons Aargau, Zürich and Schaffhausen, where such a salt, containing 90 mg. fluorine per kilogram as sodium fluoride, is marketed at this moment, following decisions by local governments in 1955 and 1956.[3] Behind this achievement is the initiative of Hans-Jakob Wespi in Aurau. According to Wespi, this salt, containing sodium fluoride as well as potassium iodide, is distributed only to those communities in which the fluorine level in the drinking water is below 0.5 ppm.

Read at the 4th Meeting of the European Organization for Research on Fluorine and Dental Caries Prevention at Malmö, Sweden, June 1957.

It has been held against salt fluoridation that the consumption of such salt is low during the first year or years of life, that is, during an important phase in the tooth mineralization period. One conclusion, it seems to me, that might be drawn from this is that mottling of the enamel, even in its mildest forms, is less apt to occur with fluoridated salt than following the use of fluoridated water. On the other hand, it is not self-evident that a low consumption of fluoridated salt during the first year or years of life implies a diminishing cariostatic effect. The fluorine pick-up by the enamel surface of the erupted tooth, especially in the primary decalcified lesions,[7,8] may be an important cariostatic principle entering with the use of fluoridated salt. At the same time it is obvious that when a pregnant woman consumes fluoridated salt, a systemic activity of the fluoride supplement may be reckoned with. This is in agreement with the observation of Wespi,[3] that an accumulation of fluorine in deciduous teeth did actually take place following intake of fluoridated salt by the mother during pregnancy, and by the child itself during the first years of life.

Furthermore, some experimental data suggest that exposure to supplementary fluorine during early infancy is not a *sine qua non* for caries reduction. Held and Piguet[9] observed a considerable cariostatic effect of fluoride tablets (containing 0.5 to 1.0 mg. F) ingested from the age of 5 to 6 years onwards. Similar observations have been made in Japan (Minoguchi),[10] where 33 to 48 per cent caries reduction was seen in 6 to 8 year old school children following admixture of sodium fluoride to the food served in the schools.

It would, however, I think, be unrealistic to believe that a fairly constant, daily dose of fluoride is necessary for caries reduction. Significant caries reduction has actually been observed following intermittent fluorine intake in children (Bruce and Gunter).[11]

One interesting question is the choice of fluoride compound suitable for salt fluoridation. Fluorides other than the simple alkali fluorides should be taken into consideration here. I first became interested in the possibility of adding certain complex fluorides to common salt in 1950.[12] From the fluorides studied in this connection, one emerged as especially deserving of attention: sodium monofluorophosphate (Na_2PO_3F). In the rat and hamster, this fluoride gives nearly maximum reduction in dental decay at a level of 40 to 50 ppm F (Shourie, Hein, Hodge;[13] Zipkin, McClure[14]) and increases the fluorine content of the enamel in the same way as NaF (see table 1).

Table 1. Caries inhibition and fluorine deposition in enamel after ingestion of NaF and Na_2PO_3F in the rat and hamster.

CARIES INHIBITION IN THE HAMSTER

(Shourie, Hein, Hodge, 1950)

	Control diet		Exp. diet with 40 ppm F as NaF		Exp. diet with 40 ppm F as Na_2FPO_3	
	female	male	female	male	female	male
Av. total area of teeth affected	11.2	26.0	2.9	1.2	2.9	0.9

CARIES INHIBITION IN THE RAT

(Zipkin, Mc Clure 1951)

	Control diet	Exp. diet with 50 ppm F as NaF	Exp. diet with 50 ppm F as Na_2FPO_3
Caries score per carious rat	12.0	7.3 (39 % reduction)	6.6 (45.2 % reduction)

FLUORINE DEPOSITION IN RAT ENAMEL

(following 91 days on cariogenic diet, with 50 ppm F in experim.-groups)
(Zipkin, Mc Clure 1951) % fluorine, ash basis

	Control	NaF (oral)	Na_2FPO_3 (oral)
Molar enamel	0.005	0.053	0.059
Insisor enamel	0.005	0.044	0.053

Sodium monofluorophosphate is easily soluble to the extent of 25 Gm. per 100 Gm. of water, and even the calcium salt is soluble (1 Gm. in 100 Gm. of water). The complex ion PO_3F^- has high stability in solution, which does not change unless *p*H is reduced to 2.5 or lower, when hydrolysis occurs rather abruptly.[15]

There is evidence to support the assumption that Na_2PO_3F does not hydrolyze readily in vivo to yield free fluorine ions. On the basis of fluorine content, the toxicity of Na_2PO_3F is 2.5 to 3 times lower than that of NaF[13] (see table 2).

Table 2. Toxicity of NaF versus Na_2PO_3F.

ACUTE TOXICITY OF SODIUM FLUORIDE (NaF) and SODIUM MONOFLUOROPHOSPHATE (Na_2PO_3F)

(Shourie, Hein, Hodge, 1950)

	F as Na_2PO_3F (mg/kg)	F as NaF (mg/kg)
Intraperitioneal LD 50 (rats)	29	10
Oral LD 50 (rats)	75	32

Na_2PO_3F — TOXICITY

(Dept of Pharmacology, U. of Rochester)

Maximal non-lethal dosage (female mice): 160 mg/kg
Maximal lethal dosage (female mice): 200 mg/kg

To follow the fate of orally ingested Na_2PO_3F a step further, it may be observed that even during the digestive process in the stomach, hydrolysis need not occur, since the average *p*H of pure gastric juice, 1.7, is rapidly elevated by acid-binding food-proteins; in infants the *p*H of the gastric content during digestion is generally much higher, or around 5 (Hahn,[16] Huenekens[17]). In the gastrointestinal tract, Na_2PO_3F is absorbed at approximately the same rate as NaF (Likins, Zipkin[18]).

The fact that Na_2PO_3F is about twice as effective as NaF in inhibiting acid production in saliva-glucose mixtures is an interesting feature, and it is also interesting to note that increasing concentration of calcium ions does not affect this FPO_3-inhibition, as is the case with NaF (Haydon, Hein, Gardner[19]). Altogether, the inertness of sodium monofluorophosphate in the presence of calcium ions—especially in food—may have an important bearing on the biologic activity of fluoridated salt based on this compound, both locally—in the mouth cavity—and systemically.

According to Burnett,[20] potassium monofluorophosphate depresses the solubility of dentin in acid to the same extent as NaF. Topically applied to the teeth of children of the average age of 12 years, Na_2PO_3F gave 20 to 30 per cent reduction of caries in one year (Hawes, Sonnes, Brudevold[21]).

A brief account may now be given of a pilot experiment which I designed for the study of fluorine absorption from fluoridated common salt by human enamel.

Powdered human enamel was prepared from 31 thoroughly cleaned molar crowns* by a modification of the Manly-Hodge flotation method.[22] Of the dentin-free powdered enamel, 97.2 per cent passed through a 120-mesh screen. Two different types of fluoridated salt were also prepared with the optimum fluorine content of 100 mg. per kilogram common salt, one containing sodium fluoride (Salt I), the other sodium monofluorophosphate (Salt II). The common salt used as vehicle for the fluorides was ordinary commercial vacuum salt of high purity (phosphate-free, containing 99.9 per cent NaCl).

One per cent solutions of these salts in distilled water were prepared. They therefore contained 1 ppm fluorine and 10,000 ppm NaCl. The absorption was effected at 37 C. with uniform, automatic shaking of 0.2 Gm. powdered enamel and 100 ml. salt-solution for periods varying between 10 minutes and 6 hours.

The fluorine consumed by the enamel was estimated by determination of the fluorine residue in the salt-solution after this treatment. Scott-Sanchis' colorimetric method was used for analysis.[23] Addition of appropriate amounts of the interfering substances to the standard solutions was employed to cancel out the interference effect, thus eliminating the necessity for distillation. The error due to dissolved enamel was slight and positive, corresponding to 0.05 ppm F.

In the 6-hour test the absorption of fluorine from the solution of Salt I, containing NaF, was of the order of 47 to 50 per cent, average 49 per cent (see table 3). The corresponding absorption from the solution of Salt II, containing Na_2PO_3F, was of the order of 47 to 53 per cent, average 51 per cent. Since 49 per cent of the initial fluorine was absorbed from both solutions after only 20 minutes, it seems that under the given conditions the fluorine absorption reached a maximum in the first 10 to 20 minutes.

Table 3. Results of pilot experiment for study of fluorine absorption from fluoridoted common solt by humon enomel.

FLUORINE ABSORPTION BY HUMAN ENAMEL — FROM SALT COMPOSITIONS (pilot study)

	Incubation (at 37° C)	Before treatment: Fluorine content gamma	After treatment with 0.2 g powdered enamel: Fluorine Residue, Av. gamma	Absorbed fluorine, Av. gamma
TABLE SALT I	10 min	100	58	42
1 % solution in distilled water:	20 „	100	51	49
(1 ppm F as NaF)	30 „	100	50	50

	60 „	100	50	50
	6 hours	100	51	49
TABLE SALT II	10 min	100	54	46
1 % solution in distilled water:	20 „	100	51	49
(1 ppm F as Na_2FPO_3)	30 „	100	50	50
	45 „	100	50	50
	60 „	100	50	50
	6 hours	100	49	51

Table salt I: 0.01 % F(as NaF) per kilogram sodium chloride
Table salt II: 0.01 % F(as Na_2FPO_3) per kilogram sodium chloride

(SANTESSON-FISCHER 1955)

Both the chemical and the biologic characteristics of sodium monofluorophosphate suggest that this compound is especially suitable for salt fluoridation purposes. A fluoridated salt containing sodium fluoride is already currently in use in Switzerland (Canton Aargau), and a parallel distribution of fluoridated salt based on

*The teeth were kindly placed at my disposal by Prof. Y. Ericsson at the State Dental School, Stockholm.

Na_2PO_3F in some other territory might well be undertaken under controlled conditions.

Summary

A short review is given of the advantages and possibilities of salt fluoridation, and reference is made to the present (since 1956) distribution of artificially fluoridated salt on the Swiss market. I also advance the opinion that a complex fluoride less toxic than sodium fluoride, yet equally cariostatic—viz., sodium monofluorophosphate—may be especially suitable for salt fluoridation. Two different salt compositions, one containing 100 mg. F per kilogram salt as NaF, the other 100 mg. F per kilogram as Na_2PO_3F, were investigated. One per cent solutions of these salt compositions in distilled water (containing 1 ppm F) were shaken for varying time-intervals with powdered human enamel. The absorption of fluorine from the salt solutions, as determined, was found to be almost identical for both salt compositions, although Na_2PO_3F under the given conditions yields the essentially stable, complex FPO_3-ion and not free ionic fluorine.

The Irrational Foundation of Statism

For some hundred odd years the U.S. postal service has been a nationalized industry. Year after year all other industries have been taxed in order to cover the growing losses of the post office. Run by politicians and operated according to antiquated principles of business and accounting, it constitutes a permanent drain on the economy. And yet, in spite of the conclusive evidence of waste and inefficiency, few question the wisdom of our ancestors in nationalizing the services of the Pony Express, Adams Express, Wells Fargo, and other private companies that helped to open the West. Most people reiterate our ancestors' errors: They point to the growing volume of postal business and assert that private enterprise could never handle it. But the same persons may make a hundred telephone calls through a private company for each letter they mail through the U.S. postal service. Or private companies may, within a few hours after production, bring them many quarts of milk from places hundreds of miles away before the postman delivers a single letter.

By Dr. Hans F. Sennholz in The Freeman, August 1957, Volume 7, pp. 15-16.

Fluoride Treatment of Teeth on an Individual Scale

Jesse Q. Sewell, M.D.
HARRINGTON, WASHINGTON

In recent years there has been a great deal of publicity concerning the effects of fluorides on dental decay. It has become the general consensus of opinion that fluoridation of drinking water will reduce tooth decay. There has been a great deal of time and effort spent by individuals and the public health department in an effort to get the water supplies of cities fluoridated so as to benefit the children growing in the city and drinking water from the city water supply.

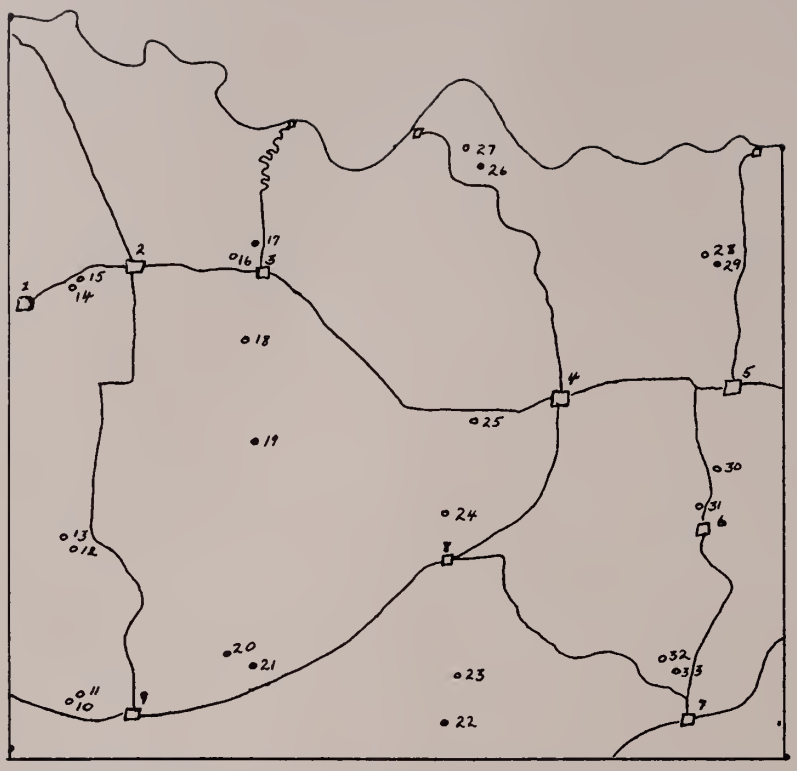
In all of this work, two things have become apparent: 1. Those persons who are so unfortunate as to live in a rural area are obviously outside of the benefits of a fluoridation program. 2. Those children who are living in cities which have not begun to fluoridate water are likewise receiving no benefit from this fluoridation program.

It is possible that after use of a plan such as this in those areas which reject fluorides in city water supplies, public acceptance of fluoridation could be increased. This increase could come from increased tolerance to the idea of fluoridation derived from the common use of fluoride and from the presence of fluoride in many of the homes. It also could come from the eventual realization on the part of many families that it would be much simpler to spend a few cents a year in tax money to get fluorides into the water supply than it is to give a child three teaspoonfuls of water a day from a separate bottle.

In an attempt to rectify this situation in Lincoln County, Washington, the following work was done at the approximate cost of $110 to the Lincoln County Department of Health. Consideration was given to the general distribution of the population, the general distribution of fluorides in the county waters and to the attractiveness of a fluoridation program to the individual mother. This program has proven to be extremely effective. Where it is offered to the mothers, approximately 85 per cent of the mothers utilize the method of administration outlined below.

The following is a reproduction of the information sent to school officials, doctors and dentists in Lincoln County:

Lincoln County Health Department
Davenport, Washington
13 May 1957



Fluoride Treatment of Teeth on an Individual Scale

Lincoln County, Washington, is a rural area of some 2,500 square miles with a population of 11,000. Five or six thousand of this 11,000 are town dwellers, most of whom are elderly people. There are around 1300 wells in the county, each connected to a house which is inhabited by the younger couples who are raising families. The problem of supplying fluoride to the children in Lincoln County then becomes a problem of individual fluoridation.

To complicate the situation there is already some fluoride present in the waters of the county.

There is no doubt that the administration of fluorides to individuals from the time that they are fetuses on up through the early teens is a beneficial maneuver. This administration of fluorides will decrease tooth decay in any given individual. In general, one may expect a 60 per cent reduction in tooth decay in a particular individual who has been exposed to optimal doses of fluorides since conception. There will be lesser benefits to children who are exposed to fluorides beginning at a later age, proportional to the lateness of inception of therapy.

The optimal quantity of fluoride in the daily diet as fluoride ion should be between 1 and 3 mg. per day. If this dosage is exceeded the only effect usually noticed is that of mottled teeth. There is a certain amount of fluoride present in the diet taken by normal people. There is also a variation in the amount of water consumed by normal people. For that reason, it is recommended that the fluoride be administered in a water soluble form in a concentration in daily drinking water of .7 to 1.5 parts per million fluorine. The assumption of this estimate is that the person will drink sufficient water to cause his intake of fluoride to be between .7 and 1.5 mg. of fluoride ion

Fluoride concentrations in Lincoln County Wells at sites selected as shown on the above map. Concentrations and statistics are listed in numerical order on the accompanying page [see table below]. Further information can be obtained from the Lincoln County Department of Health.

FLUORIDE CONCENTRATIONS IN LINCOLN COUNTY WELLS

	Name	Depth of Well	Depth of Casing	Presumably Surface or Ground Water	Fluoride F Parts Per Million

daily. For the present purposes it will be easier to equate milligrams to parts per million. If a concentration greater than 2 or 3 ppm fluoride is reached, there is a possibility of undesirable effects. There has been no proven medical disability to the ingestion of fluoride in a water supply.*

Below is listed a formula which gives a fluoride ion concentration of approximately .32 mg. per dram of fluid. This formula has a number of advantages. 1. It is safe. A person would have to drink a sufficient amount of water to cause fatal water intoxication to come within 25 per cent of a fatal dose of fluoride. 2. It has a color that is not likely to be confused with any other preparation in the household. 3. It is an easily dispensed item. 4. It is very cheap. The most exorbitant figure that could be charged by a druggist for a gallon of this preparation is $2. This gallon would last one individual for at least 256 days, considering that there would be no fluoride in his local water.

THE FORMULA

Sodium Fluoride		0.55 Gm.
Distilled Water	q.s.	1.0 gallon
Green Color		3.0 drops

*In the above paragraph you will notice that dosage was equated to concentration and you will also notice that there was no adjustment made for the size of the person, the amount of water that they would drink, or the change of the seasons. There has been so much confusion in the current literature concerning these factors that it was thought best to omit them here. The most frequently made mistake is that of assuming that everyone in the world drinks exactly one quart of water daily. This mistake has been made so often that we are certain that many people reading this article assume that this is true. If the reader is in a thinking position and prefers to use a dosage of a medicinal which is individualized according to the size and needs of the individual patients, he is welcome to do so.

The label on the gallon jar should read in large red letters:

1. Sodium Fluoride Solution.
2. This preparation is non-toxic if taken as directed.
3. Do not use fluoridated toothpaste.
4. Do not have teeth treated with fluorides by a dentist.
5. Do not use this preparation when away from home.
6. Take only as directed.

Then in ordinary print on the label of this gallon jug is the direction to take 1 teaspoonful in a little fluid ..... times a day until 14 years of age. Pregnant women should follow this same dosage.

Special note should be made of the fact that a kitchen teaspoon does not hold a medicinal dram. The usual ratio is 4:5.

It is also worth note that mothers will occasionally omit doses for one reason or another.

In order to figure the dosage of fluoride for any given child, one must use the accompanying map and information sheet to extrapolate the approximate fluoride concentration of the waters in his area, and then add a sufficient amount of fluoride, teaspoonful at a time, to his daily diet so that you feel that he is getting between .7 and 1.5 mg. of fluoride a day in addition to that fluoride which is found in his natural diet.

"March of Medicine" TV Program To Be Aired January 23

The work of American physicians in remote regions of the world where native populations are largely dependent upon our doctors and medicine for their health and well-being is the television story to be aired coast-to-coast January 23. Entitled "MD International," the hour-long show will be presented at 10 p.m. EST over the full NBC-TV network both in color and black and white. This is part of a joint American Medical Association and Smith, Kline & French Laboratories project to inform the American public of people-to-people activities in the health profession for the promotion of better international understanding.

The telecast reports on doctors' activities in thoracic and general surgery, orthopedics, ophthalmology and general medicine in such far-flung areas as Korea, Hong Kong, Burma, Sarawak, Nepal, India, Lebanon and Ethiopia. A special March of Medicine team traveled more than 34,000 miles to film these doctors in their unofficial roles as America's "medical diplomats."

Poisoning with Liquid Plastic Catalyst

Report of a Case

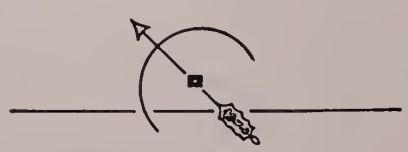
J. B. Deisher, M.D.
SEWARD, ALASKA

With the development through modern chemistry of new, useful products for wide distribution, poisonous or harmful properties of some of them have brought additional problems to physicians. Since accidents commonly cause pediatric and adult mortality and morbidity, discovery of poisonous qualities of these new products merits reporting. The following is a report of the consequences of ingestion of plastic catalyst used for application of fiberglas protective coat to hulls of small boats.

CASE REPORT

A 34 year old Eskimo male longshoreman was admitted to the Seward General Hospital on September 5, 1956, in obviously intoxicated condition. He was vomiting and retching severely. The history, as related by friends, was that in the course of an evening's drinking he requested another drink and was jokingly directed to a "brand new bottle setting over there on the window sill." It was suggested that he could chase it "with that purple stuff in the bottle next to it." Fortunately he complied with the first suggestion only. Consumption of the second liquid presumably would have resulted in a plastic cast of the inside of his stomach. He consumed approximately 2 ounces of the material labeled "P-102 Catalyst." This resulted in quite prompt vomiting which continued for several minutes and suggested to his comrades that he should seek medical assistance. It is estimated that he was brought into the hospital about 15 minutes after the original incident.

On admission, because the nature of the substance consumed was not known, he was given mustard water to complete the emptying of the stomach prior to the arrival of the physician. A large stomach tube was subsequently inserted and the stomach lavaged copiously with soapy water. In addition to the odor of alcoholic beverage there was a distinct acrid odor to the material extracted from the stomach. It was then that the original bottle was obtained and a wire dispatched to the manufacturer requesting details of the composition of this substance. The following answer was received: "P-102 Catalyst contains methyl ethyl ketone peroxide contents 60 per cent, diluent dimethyl phthalate 40 per cent, active oxygen 11 per cent minimum."



Examination of the patient revealed a well-nourished, well-developed adult Eskimo male who was stuporous and could be aroused only with difficulty. His only communications were that his stomach hurt and he seemed to experience pain on swallowing. The general physical examination was negative except for the marked reddening of the mucous membranes of the mouth and throat and some tenderness in the midepigastrium. The vital signs were normal.

He was treated with intravenous fluids, glucose, and vitamin B complex. Within a few hours he recovered from the alcoholic intoxication and complained of moderate headache. His major complaints however were of pain on swallowing and a burning pain in the upper abdomen. By the end of the first 24 hours he was unable to swallow fluid. He required intravenous hydration and alimentation for two days. The epigastric burning pain subsided in six days, although the dysphagia continued for only five days. During this time the mucous membranes of the throat showed whitish shredding as a result of the chemical burn which they had received. Lozenges of topical anesthetic gave little relief. Healing was accomplished spontaneously with the supportive therapy that was provided, and the patient was discharged in a chastened mood on the eleventh day.

Three weeks later he appeared in the office with the complaint that over the last 10 to 14 days he had noticed some difficulty in swallowing meat unless it was extremely well chewed and that on the previous evening he had been unable to swallow an aspirin tablet. Esophagoscopy revealed a stricture of the upper esophagus permitting passage of a 22F dilator. A stricture was felt in the lower esophagus as well. Over the next nine weeks his esophagus was dilated under local anesthesia up to 32F. He has had no complaints in the subsequent three months.

Final diagnosis was chemical burn of upper alimentary tract with subsequent cicatricial stricture of esophagus, due to plastic catalyst.

Pelvic Surgery

Deficiencies In Medical Education Revealed In Office Examination of 500 Women

MERRITT P. STARR, M.D.
ANCHORAGE, ALASKA

This paper is written in the belief that it is as important to know what we are doing as it is to know what we should do. I hope to illustrate the need for greater communication and understanding between practicing physicians, research workers, and teachers; and in particular, to illustrate the need for knowledge on how well the products of our research and teaching are actually reaching the public outside of teaching institutions and research centers.

This study was undertaken because it was brought to my attention, as it is to that of most doctors doing internal medicine, that an uncommon number of women who have undergone pelvic surgery, have numerous subsequent complaints. In many cases, these particular women are not seen again by the surgeon who performed their operation. Another reason is the growing interest in the relationship of estrogen to the incidence of atherosclerosis and coronary artery disease. Evidence is increasing that women who have had bilateral oophorectomies early in life have as high an incidence of coronary sclerosis as is found in men. I believe that this study is of some value because the population in Anchorage, Alaska, is fairly representative of the entire United States, and the statistics gathered here do not represent statistics gathered from a populaion from one region alone. Most of the persons living in Alaska at the present time have come within the last five years.

Statistical data were gathered from 500 consecutive female patients, routinely undergoing a complete history and physical examination. Information as to the type of pelvic surgery the patients had undergone was obtained from them, and confirmed so far as possible, by pelvic examination.

Table 1. Total Number of Cases of Pelvic Surgery in 500 Female Patients

Type Of Surgery	Cases	% of 500	Average Age at Surgery
Total pelvic surgery	177	35.0	
Hysterectomies	82	16.0	35.5
Bilateral oophorectomies before age of 40	27	5.4	29.5
Unilateral oophorectomies	41	8.2	28.5
Surgically sterilized before age of 35	74	14.0	
Multiple consecutive pelvic operations	41	8.0	

Hysterectomy Is Most Popular Pelvic Operation

As noted in table 1, approximately 35 per cent of 500 routinely examined women in office practice had a history of prior pelvic surgery. I recognize, of course, that women who commonly present themselves in routine office practice do not represent a cross section of the average female population, but rather those who have complaints. Eighty-two or 16 per cent of the 500 women examined had undergone hysterectomies; 69 per cent of these were performed before the age of 40.

It is interesting to contrast these statistics with the figures published by Crawson and Hobbs which indicate that 94 per cent of patients with endometrial carcinoma are beyond the age of 40. Moore, in his textbook of pathology, states that 10 per cent of the white race develop leiomyomas after the age of 20. Of the colored race, 30 per cent develop leiomyomas after the age of 20. Approximately 1 per cent of these have been thought to undergo some sarcomatous change.

Unfortunately we did not gather the statistics on the number of subtotal hysterectomies in which the cervix was left intact, but it is my impression that this number was fairly large. Of the 500 patients, 5.4 per cent had undergone bilateral oophorectomy before the age of 40, at an average age of 29.5. Nine of these patients

had undergone bilateral oophorectomy before the age of 25. The patient's usual story was the statement that she had been found to have an abnormal lump on routine pelvic examination, and that the surgeon, at the time of surgery, finding bilateral cystic ovaries had chosen to remove both of them, placing the patient in an artificial menopause.

Inadequate Medication

Most of the women had been advised to take estrogens for approximately three to six months following surgery. Then they were gradually weaned off of them so that approximately one year following the surgery, they were no longer taking estrogens of any kind. Many of these patients were found to be suffering from the tissue changes secondary to lack of estrogen. The unilateral oophorectomies and salpingectomies had been performed most often at the time of appendectomy. Often the patients were told that they had appendicitis and at surgery, the right ovary was found to be cystic or diseased, and was removed.

Source of Neuroses

A total of 74, or 14 per cent, had been surgically sterilized before the age of 35. This group represents a major problem to both the internist and the psychiatrist, because their previous surgery is usually the root of many of their presenting complaints. In addition to the 5 per cent who are in an artificial menopause, the remaining 9 per cent who have had tubal ligations or hysterectomies have developed castration complexes and inferiority complexes, providing them with considerable domestic discord.

Within this group are incorporated many of the women who gave a history of multiple pelvic operations, usually starting in the early twenties, and ending after everything possible to be removed had been removed. Every doctor is acquainted with this type, as they are resistant to every form of therapy but continue to invade his office and futilely occupy his time.

Deficiencies in Medical Education

In reviewing these statistics, I feel that they reveal noticeable lacks in medical education:

1. More emphasis should be placed on teaching that a high percentage of adults who develop benign pathologic lesions can carry them throughout life. Such lesions do not, in themselves, warrant surgery.

2. Biopsies should be made on ovarian tissue to determine malignancy of cysts rather than to remove the whole organ.

3. The surgeon should more thoroughly educate the patient as to the nature of the operations, its consequence—including, in the case of gynecologic surgery, sterility—and the nature of the artificial menopause. In many of the cases above, estrogens should have been administered throughout the remainder of the patient's life to prevent the tissue changes consequent to the loss of estrogen.

Statistics gathered in office practice serve to point up misconceptions and rationalizations in therapeutics and diagnosis. They should be used to show where emphasis is needed in the medical school curriculum and in planning research programs.

Doctor's Clinic, 423 D St.

Western Conference of Prepaid Medical Service Plans

November 6-9, 1957

PROCEEDINGS

Report of the Permanent Committee of Plan Administrators

MR. T. H. HAMMOND
Committee Chairman
Portland, Oregon

From 1948 to 1953, Conference attendance was pretty well limited to plan administrators and a few physicians. The non-professional delegates outnumbered the physicians at least two to one. The programs involved mostly an exchange of ideas between member plans. Few outside speakers were invited to participate.

In 1953, Drs. Pitman and Watson, as Chairman and Secretary of the Conference, established a working committee known as the Permanent Committee of Plan Administrators. From that point on, the Conference has been reaching out to seek advice, guidance, criticism, and the thinking of those not directly involved in the management of a prepaid plan.

Some 40 doctor-sponsored prepaid plans in the area extending from Hawaii to Wyoming and the Mexican border to Western Canada make up the Conference with a total subscriber list of close to three million. To have a meeting such as this takes planning and time. But meetings such as this make up only a part of the activities of the Permanent Committee. Let us look back a few years.

Activities of Conference Reviewed

At the 1953 Conference in San Francisco, a resolution was passed to implement a "Transfer of Membership Program." All plans adhere to this agreement. This assures continuity of coverage without loss of original membership date to members moving from one plan area to another. Adoption of the Blue Shield Transfer Agreement would not answer the needs of the Western Conference since there are numerous doctor-sponsored local bureaus in Washington and a few in Oregon which are not members of Blue Shield. This Transfer Program is a real sales aid.

At the 1954 Conference in Victoria, the "Service Benefits Agreement" was adopted and is now subscribed to by all plans. Briefly, this extends service paid-in-full benefits to members from one plan area who require treatment in another plan area. This Agreement is most important and is a sales tool which is not always given proper emphasis by our sales staffs. It is the one benefit which cannot be provided by competition.

At the Victoria Conference, three working sub-committees were established—Sales, Statistics and Claims Processing. These Committees hold regular workshops each year in which Plan personnel engaged in these activities participate. The Permanent Committee urges every plan to participate. Much can be learned. These are workshops in true sense of the word and would do credit to some of the larger corporations in this country.

At the 1955 Conference in Seattle, a resolution was passed recommending that all member plans use in their literature and advertising the line "Member of the Western Conference of Prepaid Medical Service Plans." Most plans are doing this. The Permanent Committee encourages all plans to use this sentence routinely in their literature and advertisements.

At the 1956 Conference in Sun Valley, Messrs. Steen of Washington and Lyon of California, part of the AMA task force, explained the then-contemplated Medicare program with the Department of Defense. Although this Conference did not enter directly into the negotiations,

there is little doubt that Conference backing for these two gentlemen helped pave the road for nationwide negotiations. The Permement Committee feels that the Conference should continue to use Messrs. Steen and Lyon as spokesmen for this program. To the best of the Committee's knowledge, the Medicare program has been going quite smoothly—to the satisfaction of the physicians, the service-men and the Department of Defense.

According to the American Medical Association Washington Newsletter of September 27, 1957 the various states have a number of different arrangements for using federal medical care matching money to secure medical care for the aged, sick and disabled. Colorado, in caring for dependent children and the blind, uses its own and federal money to buy from Blue Shield and Blue Cross rather complete medical coverage. According to this release some federal officials feel that most recipients, notably the aged, need maintenance care with frequent home and office calls. The September 27 Newsletter goes on to state that security and retirement programs, public and private, are underwriting the public's income to such an extent that the share of public assistance money that can be put aside specifically for medical care is growing at a rapid rate. In two large states this has increased from 6 per cent to 35 per cent in 10 years, and it is estimated that this figure will go to 50 per cent in another 10 years. It is not too difficult to imagine the federal government or some individual state governments deciding at some time to experiment in some way with the Medicare principle for providing this health care—using the doctors' prepaid plans as the vehicle for administration.

Approval of Uniform Contract Sought

For a number of years the Conference has been talking about a uniform, Conference-wide contract. It was not until the Sun Valley Conference last year that a resolution was passed instructing the Permanent Committee to prepare an actual contract to be submitted to all 40 plans for signature. Meetings followed and correspondence ensued. Through the fine efforts of Mr. Donovan, the Permanent Committee Secretary, such a contract has become a reality and the actual contract has been mailed to each plan. Each signator to this contract will agree to provide specified basic benefits to inter-plan or inter-state groups. The Permanent Committee urges each plan to sign the necessary document immediately if they have not already done so. It is particularly important that this be accomplished in a minimum amount of time, in view of the problems being encountered by the national Blue Shield Organization in securing the approval of all Blue Shield plans to a basic uniform contract. Please mark this on your calendar as a "must."

A sub-committee of the Permanent Committee, under the chairmanship of Mr. Nyren is now working on a project which is most important and one which is most difficult to solve. It is really a part of the Uniform Contract. The plans which agree to the Uniform Contract must in turn reach an understanding on the rules for regional underwriting. This involves uniform understanding and agreement on mutualization, contract interpretation, administration of claims, sales policy, treatment of underwriting regulations, and so forth. Back in the early part of 1954, we had a tri-state contract with the Stationary Engineers with head offices in San Francisco. This contract went by the boards because we lacked agreement on the fundamental rules of regional underwriting. This must never happen again.

Mr. Nyren's committee will make a final report to the Permanent Committee within the next few months. Thereafter, each plan in the Conference will be contacted for approval.

Conclusion

Meetings like this one would probably justify the Conference. However, the items I have enumerated must not be overlooked—Transfer of Membership Program, Service Benefits Agreement, sub-committee workshops, by-line about the Western Conference in literature and advertising, Medicare program, uniform Conference-wide contract, and uniform Conference-wide underwriting. These steps have been built on the basis of mutual trust and understanding with but one common goal in view—progress. The Western Conference is a non-legalistic body—a gentleman's agreement is the basis of our accomplishments.

Do the People Want Socialized Medicine?

MR. WILLIAM MERCER
Employe Benefit Plan Consultant
Vancouver, British Columbia

The question I am asking is not whether socialized medicine is good or bad;—the question is whether or not the people want it.

By socialized medicine, of course, I mean the active participation of the federal, state or provincial and municipal governments in the provision of medicine. By medicine, I mean hospital care; medical, surgical, obstetrical and diagnostic care; drugs and even dental care. Roughly speaking, it is the problem of looking after people while they are sick—and keeping them from getting sick—although I do not include the problem of providing them with an income while ill.

We already have socialized medicine of a sort in every country of the world. Most countries have some government program for providing some medical care and treatment: dental examinations for children, free x-ray clinics, tuberculosis sanitoria, mental institutions, hospital and medical care for service men and even their dependents, and complete care of wards of the government, such as Indians and Eskimos.

When most people talk about socialized medicine, they mean socialized medicine of the interfering kind, in the same sense that they talk about government interference in private industry. Socialized medicine also usually means the compulsory coverage of all citizens, wealthy and poor alike—whether or not they as individuals want the coverage. To the best of my knowledge, so far in the United States your socialized medicine covers only people who really want and need the coverage. In Canada we have gone slightly beyond that and the rest of the world has gone far beyond it.

We have to be careful when we use the word *socialism*, because it is a relative term. Both of our countries suffer, tolerate, or enjoy (depending upon how you look at it) a fair degree of socialism. Both of us have a socialized postal system; you have your Tennessee Valley Authority; we have our Trans-Canada Airlines, and so on.

I suppose that when we use the world *socialism* we are thinking about a system which interferes with our own economic and perhaps personal freedom. I do not suppose the medical profession has expressed public concern over the gradual socialization of electric power. By the same token, I do not expect the private power interests will take much of a stand on socialized medicine.

In other words, many of us take the stand that a little bit of socialism may be all right—as long as it is not in our own field.

How Much Socialism Is Desirable?

Opinions differ on how much socialism is desirable. The fact remains that a degree of socialism is here and it is here to a substantial degree in the provision of hospital and medical services already in our two countries, and to a great degree in many other countries.

An example is the current worry of the medical profession in the U.S.A. that the Medicare program for servicemen's dependents will go beyond the bounds of negotiating stabilized fees in local areas. There will be a natural tendency for the low schedule areas to bring their feees up to the high schedule areas and a long range squeeze to uniformity, without the government being directly blamed for the indirect result in adopting the Medicare program.

It has become common practice for American and Canadian government agencies to make direct subsidies to the medical profession and hospitals for care of indigents. Often those who provide the service receive, collectively, a fixed sum and negotiate among themselves in a nice way for the distribution of that money, on a fee-for-service or patient-day basis. Right away, then, we have one of the worst possible kinds of intervention, the interference with total income of those who provide the services, in spite of the fact that those who provide the services receive a great deal more under this arrangement than they would receive from billing their patients directly.

As time goes by, some of the interferences of government become accepted by the people, just as the human body adjusts to a chronic ailment. The better the adjustment, the less is the need for a cure.

Most, but not all, of the government interference in medicine so far has been accepted by the American and Canadian public and even by those who provide the services. But let us take a big step beyond these programs and think of a comprehensive plan operated by the government to cover all or nearly all of the people in a particular area. This is the monster that people generally have in their minds when they talk about state medicine. Such programs exist in Great Britain, New Zealand, Denmark, Sweden, Australia, and many other countries in varying degrees. As far as hospitalization is concerned, we have socialized medicine in Canada and many people think this is the thin part of the wedge.

How Socialized Medical Schemes Develop

How have these schemes developed? Let us look at some of them generally, then individually. First of all, the politicians made promises of provision of services. Sometimes the promises said the people would have to pay premiums for their services, but sometimes they did not, it being intended that the services would be paid for out of general tax revenues. But the point is that the formal plan of socialized medicine usually started with a political promise.

In my own province of British Columbia, a full-fledged, province-wide hospitalization scheme was boldly put into effect in 1949 by one of the political parties several years after it had put away in moth balls an Act enabling it to grant such services. In this case, the scheme was appropriately called a *hospital* scheme, not a *hospitalization* scheme. The politicians wanted to rescue the hospitals from financial difficulty and at the same time do something politically popular. In many cases the hospitals had reached the point of bankruptcy. The people were given a hospital scheme in return for the payment of premiums, but many of the politicians believed that the scheme of benefits was not so important as the collection of premiums. In more recent years another political party has abolished the collection of premiums, the hospitalization benefits being met by an increase in the provincial sales tax. It is clear to those who have studied the development that the scheme was developed in answer to the needs of the hospitals and of the politicians, rather than the needs of the people. The people like the hospitalization scheme and so do the doctors; but it was not created from their direct demands. I would say it would now be very difficult to find a doctor in British Columbia who would speak out against this socialized scheme.

In the Province of Saskatchewan a hospitalization scheme has been flourishing since 1947. It works well. Saskatchewan is run by a nominally socialistic government (the only one in Canada), and has been for many years. We might jump to the conclusion that this scheme results from the socialistic learnings of the Saskatchewan people, but they are not socialistic. They are mainly farmers and as such are individual entrepreneurs—without the benefit of anything like the U. S. farm price support program. The demand for a hospitalization scheme again in this province was created by the politicians. Having had a taste of the scheme, the people now like it (and so do the doctors) and virtually all of the population who are required to pay premiums do so.

In the Province of Alberta, the provincial government has operated a socialized hospitalization scheme through the municipalities. It makes grants to the municipalities which, in turn, make payments to the hospitals. The tax-paying citizen pays deterrent charges and the citizen

who is not a municipal taxpayer pays a small additional premium as well.

The Alberta government is a private enterprise government of the strongest kind. It thinks of your Republican Party as parlor pink. It is for private enterprise first, last and always. It is the only province in Canada that is completely debt-free. If you said the government was a socialistic government because of its hospital scheme, they would think you were either terribly ignorant or a comic. The provincial government makes these grants to the municipalities to hush protests of the municipalities that they are not getting their fair share of provincial taxes. Once again, the scheme is an arrangement among politicians and did not arise from direct demands of the people.

As the result of a political promise made 38 years ago, the Federal Government in Canada has offered to contribute approximately one-half the cost of operating province-wide hospital schemes in all of our provinces. The Federal Government said to each province, "If you will put in a hospital insurance plan that meets our requirements, we will contribute one-half of the cost; to get a maximum share from us you will have to do certain things:

(a) First of all, you must make your hospital plan available to all of your citizens, wealthy and poor alike.

(b) You must maintain adequate standards in your hospitals.

(c) Once your citizens have paid any premiums or tax you may care to charge, you must provide free and unlimited hospital room and board at the ward level, hospital nursing service, drugs, and all other services and things normally provided in hospitals.

(d) You may, if you wish, impose a deductible or deterrent charge to discourage the unnecessary or frivolous use of hospitals by your citizens, but remember, if you wish to do this, this deterrent charge will have to be paid entirely by your citizens, and it will reduce our share of the cost, and the amount of money we are prepared to give you.

(e) Your plan must not only provide benefits for patients *in* the hospital but also for your citizens who *visit* the hospital to have such things as blood tests, urinalysis, x-rays, electrocardiograms and the like.

Coercion by Federal Government

The Federal Government has not said the provinces must provide all these benefits, but they have said that the provincial governments will have to make the scheme as generous as set out in order to get the maximum contribution from the Federal Government. But how can a province refuse to institute socialized hospitalization and even medicine under this type of coercion?

What would your states do if your Federal Government offered to pay one-half of the cost of a state plan which provided free hospitalization and free medical services rendered on an out-patient basis? Would the emotional problem of socialism deter them?

Under this arrangement our Ontario Government which, culturally, politically and economically has the same position in Canada as New York State has in your country, is going to dive head-long into the Federal plan in order to get its fair share of the Federal grant. This does not mean that the people in Ontario have long demanded a hospitalization scheme. It simply means that the politicians in Ontario believe that it will be expedient for their party to make this available to the people. It is safe to bet, however, that once the people have had a taste of it they will want it to continue, although there will no doubt be protests about various features of its operation.

We all know that a health insurance scheme in Great Britain has been run by the Government for many years—since 1911, as a matter of fact. In 1948, the scheme was considerably changed and the amount of care and the availability of it was substantially increased. The people had had long experience in state medicine by 1948 and it is reasonable to say that when the scheme was put on its new basis the politicians probably were obeying the demands of the people. The people wanted an extension of state medicine.

Under similar schemes run by other governments in New Zealand, Denmark, Sweden, Australia, and Brazil, the hospitals are subsidized heavily by the governments. Sometimes the doctor is paid on an annual fee basis computed on the number of people in the doctor's panel, and sometimes he is paid on a fee-for-service basis.

None of these schemes works perfectly, however, and there always seems to be the Harley Street physician with a profitable private practice for those who can afford to pay.

Most of the people I have interviewed who have been covered under these schemes seem to have accepted them. Some of them were surprised to find that anyone would suggest that state medicine would be inferior to medicine operated entirely through private enterprise. One 40 year old person I interviewed, from Denmark, had never experienced anything different from the national health scheme and had no basis for comparison, but could not quite understand how anyone could suggest anything better.

I must conclude that after a state medical plan gets through its early development period it is likely to be looked upon favourably by most people.

Britain's National Health Service

The National Health Service in Great Britain, which might be named as one of the schemes which interferes most with private practice, seems to be generally acceptable to a large segment of the medical profession. It is difficult to get an unbiased opinion. The British doctors with whom we visit tend to be the exceptional ones and they are generally opposed to the scheme. I think the outstanding doctors suffer under the scheme, while the average doctor does about as well, or perhaps a little better than he used to. I suspect that the poor doctor does better.

There is no question that there have been tremendous abuses of the service. The volume of care that now must be provided by the general practitioner (in the terms of the number of patients he sees per day) has skyrocketed. It has all the evils of a bureaucracy of the worst kind. We have all heard funny stories about the outlandish expenses of government agencies. Let me tell you one that I think tops them all. Some of you may have heard it before but it is good enough to hear again:

Following is a true and verbatim exchange of cor-

respondence between a London hospital and Britain's Ministry of Health:

> From the Ministry, March 16, 1954: Sir: I am directed by the Minister of Health to request that the committee will forward for examination a few sheets of paper off one of their toilet rolls purchased at 5 6s 9d per gross. It is also requested that the weight of one of the rolls may be furnished.
>
> From the Hospital, two days later: Sir: Herewith the sample as requested. The weight per roll is 12 oz.
>
> From the Ministry, six weeks later: Sir: It was partly due to complaints by the hospitals of the quality of Stationery Office toilet paper that the specification was improved to exclude papers containing mechanical wood and of low bursting strength. The sample purchased by your committee contains mechanical wood (about 20 per cent) and bursts at 5 to 7 lbs. as compared with *our* minimum burst of 8 lbs., and accordingly the sample is not considered suitable for supply.
>
> Furthermore, the pieces are 6½ in. long against our specified 6 ins. and therefore the committee have been getting approximately 8 per cent less pieces per roll than that of central supply. If the rolls are 12 oz. including the core, a further shortage of 5 per cent less pieces is sustained as central supply is 12 oz. excluding cores.
>
> Any saving which may be more apparent than real should be revicwcd in the light of the above information. A sample of better quality central supply is forwarded herewith.
>
> From the Hospital, six weeks later: Sir: My committee have given most careful consideration to your letter of April 27, but they are unable to agree with your conclusions.
>
> The rolls purchased weigh 12 oz. excluding the core and the assumption made in your letter is therefore incorrect.
>
> So far no adverse affects on either patients or staff appear to have been sustained by using a paper of 1 lb. to 2 lb. lower bursting strength than that supplied by the Stationery Office by reason of the inclusion of mechanical wood. In this connection my committee would be interested to know what mechanical wood is, as they are under the impression that wood is a natural or vegetable product. Is there a mineral wood as well as a vegetable wood?
>
> With regard to the question of length of the sheets my committee feel that 6½ in. provides a greater margin of safety for patients who are restricted in their movements and that there is a possibility of adding to laundry costs if a smaller sheet is used.
>
> Finally, the difference in cost between toilet paper supplied by the Stationery Office and that purchased by my committee shows a saving of approximately 20 per cent and this amounts to about £200 per annum. It would therefore appear that the saving is real and not apparent and, in view of the Minister's request for economies in the hospital service, my committee sees no reason for changing their source of supply.

In answer to the question: "Do the people want socialized medicine," I must regretfully but honestly answer that I think they do, if there is any chance of getting it. It is like the well-adjusted married man sitting at a bar. A beautiful girl sits beside him, touches his arm and says: "Are you preoccupied with sex?" His answer, of course, is: "Well, I wasn't up to now, but—!"

In spite of all this, suppose you are like I am. You are opposed to socialism in general and socialized medicine in particular. I think it can and should be fought. After all, death is inevitable but each of us should forestall it as long as possible.

Convince Politicians Socialized Medicine Not Necessary

The obvious course is to convince the politician that socialized medicine is not necessary, and to show him, on the basis of experience in other parts of the world, including my own country, that he is likely to be politically crucified if he brings it about too quickly.

Now if we are going to convince the politicians that socialized medicine is not necessary, we must know the enemy's arguments. After all, the politician is close to professional sociologists.

The following is what I believe goes through the sociologist's mind:

> The ordinary man wants good medical care to keep him and his family well and to reduce his suffering and to improve his chances of recovery when he is sick. He wants to be able to obtain the care when he needs it, without long delays because of shortage of facilities and personnel. He wants to get the best care possible within a reasonable distance of his home. He wants to know that it is available, whether or not he needs it at any given moment.

Concern Over High Costs of Medical Care

However, the costs of medical care are high, and as medical knowledge increases, they become higher.

The costs of medical care are difficult to budget for. Unless the citizen carries insurance, he does not budget for medical care. If he does have medical expenses he faces the problem of paying for them at the time he is ill, the very time when his income is reduced.

The nation is more conscious than the individual citizen of the importance of health because it is concerned with the well-being of all of its people. A country is weakened if its people are unhealthy. The efficiency of the labor force, the economy of the country, its strength in time of war, are affected by the physical and mental condition of each citizen. Public funds must be spent to care for and support the people who cannot provide for themselves because of illness.

The nation as well as the individual, therefore, has an interest in the costs of medical care, and in the standards of care available. Governments are already involved in health measures that require community rather than individual action. The establishment of a nation-wide health program depends on whether a nation is so concerned about the health of its individual members that it believes it should assume further responsibility in seeing that health needs are met.

The people who provide medical care are also concerned about the costs. The hospitals must be able to meet their financial obligations. They have traditionally financed their capital costs from voluntary funds supplemented by government contributions. Their day-to-day operating costs have been financed to a large extent by patients' payments. As the costs have risen the charges have risen, and more people have found it difficult to pay their bills.

Many hospitals have been in serious financial diffi-

culties. They have appealed for more charitable gifts; they have received increased funds from governments and they have tried to work out ways by which the ordinary man can pay his own bills by installments in advance. Hence the prepayment plans organized by hospitals. Yet these plans have themselves created problems.

At the same time, the theory has developed that it is not only patients who should pay the operating costs of hospitals. Modern medical methods call for an increased use of hospitals and a large part of the population will require hospital services at some time. Everyone wants the services to be there if needed, and a hospital must keep some empty beds. It is argued, therefore, that all people should help pay for maintaining the services, as they do for the fire department.

Before the prepayment plans developed, each doctor was his own collection agency and he always had a proportion of unpaid bills. He has given much free service and, as in hospitals, the rich have paid in part for the poor. Despite the desire of doctors to provide good medical care for all, the treatment they have been able to prescribe has been controlled somewhat by the patient's ability to pay for a specialist, for hospital care or for expensive drugs.

Problems in connection with facilities and payment for services are also experienced by pharmacists, nurses, dentists, and all other health personnel.

Can the prepaid plans answer all the sociologists' requirements? I think they can, given courageous and enterprising management and assuming a high and broad, rather than narrow, standard of ethics by the medical profession.

How far can the prepaid plans go to satisfy the needs of the politician and ultimately the people as a whole? The prepayment schemes (including insurance company contracts) now successfully cover a large percentage of the population for a large part of the cost of medical and hospital care. Furthermore, the underwriters are definitely competitive and, all things being considered, the people get good value for their premiums. With respect to those who are covered and to the benefits covered, most prepaid plans should feel they are doing a good job. But the prepaid plans have fallen far short of the mark in many respects. The politicians have plenty of fuel to use.

Specific Problems

Let us get down to specific problems. The indigent cannot prepay his premiums let alone pay his actual medical expenses. Some people, such as pensioners, though not actually indigent as defined by government welfare agencies, find they are financially unable to prepay the premiums for their costs of medical and hospital care. Many aged people cannot obtain prepaid coverage even if they can afford it. The self-employed person, particularly the one who has a very serious disability or medical impairment, usually finds it difficult to make an arrangement adequately to prepay his expenses for medical and hospital care. Farmers are out in the cold in many areas. Some people live in places where prepayment does very little good, for the medical and hospital services are simply not available in their areas.

If it is argued that hospital expenses and doctors' fees have become unreasonably high, should the prepaid plans try to exert stronger pressure to keep those costs down in fear of state medicine?

It is often charged that prepaid doctor-sponsored plans have failed to represent the subscriber in negotiating restrictions on increases in the doctor's fee schedule. No doctor-sponsored plan, to my knowledge, has gone the whole way in establishing an independent mechanism for negotiating and arbitrating increases in the fee schedule. The public generally thinks the prepaid plan is acting on behalf of the subscriber but has any prepaid plan really taken the position that it is the bargaining agent of the subscriber?

If the politician argues that the prepaid plans do not adequately allow for covered subscribers to transfer from one area to another while retaining uninterrupted coverage, should not the prepaid plans negotiate savings bank arrangements or transferability of coverage agreements among themselves?

If the prepaid plans freely allow subscribers to incur unnecessary services and the medical profession encourages excessive utilization, should the prepaid plan strengthen its control to diminish the excessive utilization and overservicing?

If the politician charges that a prepaid plan does not cover enough services, should the plan broaden its contracts?

On the face of it, the answer to all these questions seems to be "Yes" but watch out. Is there not a trap in our path? Suppose a prepaid plan in a given area becomes very successful through fear of the ogre of state medicine, and satisfactorily avoids virtually all of the criticisms of the politician. Will not the plan create the very mechanism which the government needs to start a government health plan? What is the difference between the prepaid plans putting the squeeze on doctors' fees and the state doing the job?

The danger is quite clear. As the politicians criticize the agency that provides health insurance on a voluntary prepayment basis, this agency will attempt to strengthen its hands. The better it does the job the more likely will be its capture by a government under a political party that finds it expedient to take the credit for offering comprehensive medical care to the entire public in that area.

Minimum Objectives of Prepaid Plans

However, there is an escape. Remember that when the people have a taste of state medicine they apparently like it; what you have to do is stop the people from getting a taste; therefore you have to stop the politician from using state medicine as a plank in his platform. As stated earlier, the public probably would vote "Yes" on a referendum asking whether they want a government-operated hospitalization scheme—and perhaps even a government-operated doctor care scheme. Here are some minimum objectives or aims that I think the prepaid plans should keep uppermost in their minds if they sincerely want to forestall state medicine:

(1)—No prepaid plan should make itself so strong in a given area that it becomes a clear-cut nucleus for a government scheme. The plan should promote healthy competition from other underwriters.

(2)—The plan should see that the politically influential as well as the politicians themselves are covered under the prepaid scheme.
(3)—The level of coverage that is provided by the plan must satisfy most but not all of the public's needs. The public must be educated to accept the fact that not every expense should be covered. It is not just a question of deterrent fees; the plan should recognize the need for luxury care for those who want to buy it outside the plan.
(4)—The plans collectively should see that virtually everybody who should be covered is able to obtain prepaid coverage whether or not he becomes covered. This requires that the prepaid plans set out clear boundaries between the medical care for which the government will accept direct responsibility and the medical care which the prepaid plans will cover. The wards of the government, the indigents, some of the aged, those in mental institutions and T.B. sanitaria should continue to be covered by government agencies but it is important that the plans decide what is their responsibility and what is the government's responsibility. To the best of my knowledge nobody has made a sincere effort to set out clearly what part of medical and hospital care should be undertaken by the government and what part should be undertaken by voluntary insurance agencies. The self-employed and people in lightly populated areas must be given an opportunity to prepay their expense.
(5)—The plan should see that the doctors are paid enough to encourage an adequate supply of doctors.
(6)—To prevent the politicians from arguing successfully that the government will have to step in to provide hospital beds where private enterprise has failed, the hospital insurers should take a hand in meeting depreciation and interest charges for new construction.
(7)—The prepaid plans will have to educate the public that it is definitely not desirable to cover all medical expenses. Who knows how much medicine is enough? There is a natural limit to the amount of food we can eat, clothes we can wear, cars we can drive, and the like. But none of us is an absolutely perfect physical specimen and there is no theoretical limit to the amount of medical attention we can demand in an attempt to be one. In the field of mental health we suppose that there is only one perfectly normal person and all the rest of us deviate from him in some respects, no matter how minute and unimportant those deviations may be. For the purposes of outlandish illustration only, if the goal of all of us is to be absolutely normal, we should each have to be provided with a full-time psychiatrist.
(8)—The prepaid plans will have to set up mechanisms for negotiating levels of fees for the doctor's fee schedule and levels of charges in the hospital. Ultimately the plans and the doctors will both have to accept arbitration techniques to settle the schedules. Let the doctors figure out the ratio of fees for various items in the schedule but the total dollar volume derived from a schedule will have to be settled by negotiation and arbitration. Now, with the predominance of prepaid medicine, the decision on the percentage of the national income which is to be diverted to medicine is being taken from the individual and placed in the impersonal hands of unions, employers, the medical profession, insurance underwriters and the hospitals. Under our current high levels of prosperity, the absence of realistic bargaining among these parties has not appeared to be a serious problem but with medical costs soaring as they are it may come. More scientific methods of creating fee schedules will have to be adopted than have appeared to date. The supply of doctors in a given area in relation to the demands of the public for service in that area is just as important a factor as the skill that is required to perform a particular procedure. The point is that once the prepaid plans become successful in covering virtually all of the coverable people for most medical and hospital services, there will no longer be a private practice yardstick as a measure of reasonable expense. The nearer they get, the weaker the yardstick. If the plans do not find measures that the public will accept, the Commissar will step in. The plan must uncover abuses of utilization and service and find steps to diminish those abuses.

Conclusion

I think I can sum all of this up in this way: It should be possible for the prepaid plans and the medical profession to jointly, *not individually*, but *jointly*, make this simple statement:

> No citizen is denied necessary medical attention by reason of his inability to pay.

Until this statement is true (if it is not substantially so already) and until it is plastered on the billboards of America, socialized medicine is a threat and a fairly immediate one.

How to Prevent A Blue Shield Crash

LEONARD J. RAIDER, M.D.
New York, N. Y.

Have you ever heard of the phililoo bird? It is a mythical creature that flies forward but looks backward. It can see what it has passed but not what lies ahead. So it sometimes wings away from one danger only to flap blindly into another.

We physicians have our own phililoo bird: voluntary health insurance. It has borne us away from grave danger. But while looking thankfully back at all the safe distance traveled, it seems unaware that it is heading straight toward new peril. What new peril?

One that the very success of voluntary health insurance has created: Blue Shield was begun as an alternative to government control of medicine. It has worked beautifully. Too beautifully, in fact. For the commercial companies, which once called health insurance unworkable, have learned they were wrong. So they now threaten to take over the whole field.

In too many places Blue Shield is either an indemnity plan or has woefully inadequate service benefits. Because of this, there is a good deal of public dissatisfaction with the plans. And such dissatisfaction is grist for the commercial companies' mill.

Going, Gone

They have already wooed away large numbers of middle- and upper-income Blue Shield subscribers. Their medical-surgical policyholders, 63,000,000 of them, already outnumber by 62 per cent the total enrollment of the Blue Shield plans. How have they done it?

By underselling Blue Shield with indemnity contracts. They can afford to compete in this way, because their subscribers are a carefully selected lot of good risks, people who use their policies less than the average. The poor risks, those who are sick more often, have to stay with Blue Shield, since the commercial companies do not want them.

As a result, some of the doctors' plans are losing so many good risks that they may soon be left with a dangerously high proportion of poor risks. When too many subscribers make above-average use of their policies, subscription rates will naturally have to rise—again and again, perhaps. Inevitably, this will mean that low-income subscribers, no longer able to afford Blue Shield, will have to drop it. Probable consequence: a catastrophic Blue Shield crash. And if Blue Shield goes, we physicians lose a staunch guardian of our professional freedom.

To understand how this ominous situation has come about, let us take a brief look at the history of voluntary health insurance in the U.S.

The Bad Old Days

The need for some such insurance was first realized during the great depression of the 30's. In those years, increasing numbers of Americans found it almost impossible to pay doctor bills. Yet because of a general lowering of living standards, they needed more medical care than ever before. Physicians were working harder and harder for less and less money. The menace of socialized medicine began to grow.

Sorry—Impossible

AMA asked commercial insurance officials if they could find a way to work out some sort of health coverage. The answer was a polite no. Health insurance, the officials said, would violate certain unalterable principles of insurance.

The main principle they cited was this one: All insured things or persons must be divided into classes according to the risk involved in insuring them; and each such class must have different premium rates. For instance, the fire risk for a wooden house is greater than for a brick house. So the premium rate must be correspondingly higher.

But no such actuarial law could be applied to health insurance, said the insurance men. They explained that the families the doctor wished to insure were the families that needed care most. They would use their insurance most often and would therefore have to be placed in a bad-risk, high-rate class. Yet these were the very families that could least afford high rates.

One Happy Family

The insurance companies' turn-down of the doctors seemed based on sound economic fact. But it did not take into account a simple but tremendous discovery made a few years earlier:

Late in 1929, a Texas hospital had taken the unheard-of step of enrolling all the schoolteachers of Dallas in a hospitalization insurance program. This was a daring gamble because, as you know, women are ill more often than men, and the elderly more often than the young. But the hospital made no distinction among the 1,400 schoolteachers on the basis of sex or age.

Everyone was integrated into one group. Everyone paid the same premium. And everyone was happy because the hospital soon found that its gamble was a safe one.

Before long it was realized that the community as a whole had the same annual sickness rate as the schoolteachers, and that it would be equally safe to enroll other groups in a hospitalization plan. Thus was discovered the simple principle of community rate—the basis of the Blue plans.

We're Off

The idea spread fast. By 1939 there were 48 Blue Cross plans with more than 3,000,000 members.

That same year, California's doctors reached a historic decision: They decided to apply the community rate idea to surgical care. In other words, they set out to solve what insurance men considered a hopeless problem.

So Blue Shield was born. The phililoo bird started its ascent. Enrollment soared. By 1941 there were 370,000 members in 8 U. S. Blue Shield plans. By 1947 there were 1,825,000 members in 18 plans. By 1950, 12,000,000 members in 63 plans!

The figures kept on rising. Coverage was widened. Surgical benefits were broadened. In-hospital medical care was included. Everything went zooming along. The original danger seemed far behind.

Already, though, the phililoo bird was winging toward new danger. While payroll deductions and employer contributions gave Blue Shield further big boosts, such things also meant the beginning of trouble.

What happens when an employer pays for part or all of his employees' insurance? The answer is obvious: He begins to wonder whether he couldn't get it somewhere else for less money.

Take two manufacturers, both of whom contribute to Blue Shield for their workers. Because of the kind of product one man makes, he hires only healthy young men. The other hires women of all ages.

Why Not a Lower Rate?

The first employer, knowing that his plant uses the coverage far less than does the other, is bound to resent having to pay at the same rate. He says to himself: "My workers are healthier. Why can't I find an insurance company that will insure them at a special low rate?"

So he does. His group is segregated from the com-

munity rate. And a commercial insurance company profits at Blue Shield's expense.

That is what has been happening all over the country. Now that the pionecring doctors have made health insurance a going concern, the commercial companies have steppcd into the picture, suddenly eager for vast enrollment.

It's the Money

A vast enrollment of the good risks, that is. Naturally they won't touch the bad risks. After all, commercial carriers exist to make money.

How does what is happening affect you? Well, if enough good risks are pulled away from the Blue plans, the result may be an end to community rate which has to be a combination of good risks and bad. An end to community rate means an end to Blue Shield. And then what?

There are relatively few poor people in this country today. But installment buying, high prices, and the long list of items a family now deems "necessary" have kept poor health-insurance risks numerous. When such persons can no longer have Blue Shield, what will they do for their medical care? They will get it free, of course, whether from us directly, from organized charity, or from government. No matter how it is done, you and I stand to lose. Can we do anything about the situation?

Of course we can. Our problem is how to keep people in the community plans. And we have the answer: *service benefits.* For service benefits are far more attractive to the subscriber than indemnity payments. He wants to be fully covered, if possible, and he knows only too well how very partial indemnity payments can be.

So if the good risk can get service benefits from the community plan, and only from it, he will stick around. It is to his advantage to do so.

In some areas of the South and West, where Blue Shield is on an indemnity basis or has very limited service benefits, the commercial companies have bagged more than half its subscribers. But in the Northeast, where there are a number of good service programs, the Blues still have much larger enrollments than the commercial companies.

The term *good service program* is admittedly a loose one. I cannot define it precisely, because it must vary with each local plan. What is adequate service coverage in my community may not be quite adequate in yours.

But there is one vital test of how any Blue Shield plan measures up: To be adequate today, it must offer service benefits to a range of subscribers including the middle income families.

Whatever the average family income figure may be in any locale, nothing less than that should be the family income ceiling for service benefits. Yet the plans have ceilings that meet this standard in comparatively few places. The family income ceiling is $6,000 in California, the District of Columbia, New York, North Carolina, North Dakota, Oregon, Pennsylvania, and Virginia. In Utah and Washington State it is $7,200; in New Jersey, $7,500.

Those are comfortable figures. But Blue Shield family income ceilings seem inadequate for 1957 incomes in a good many other states. They range downward to $3,600 in Florida, Georgia, Rhode Island, and South Dakota.

A few months back, Elmer Hess told AMA: "Today's professional freedom to be a private practitioner instead of a slave of Government is due solely to Blue Shield."

With a foresighted service program, Blue Shield can continue to shield us from slavery. Otherwise, it will remain a phililoo bird whose eventual crash seems almost certain. More than most physicians realize, the choice is up to us.

The Strengths and Weaknesses of the American Economy

PROFESSOR ROBERT R. DOCKSON
School of Commerce
University of Southern California
Los Angeles, California

The theme of your conference is "Economics and Medicine in a Modern Society" and I want to congratulate you for selecting it as your focusing point over the next couple of days. If every industry would analyze itself in such a way, I feel certain a better understanding of both the economy and the industry would result.

My role in your conference is a relatively simple one. All I have to do is to review the behavior pattern of our economy and to isolate and examine with you the more important strengths and weaknesses that presently exist. The discussion will be divided into two parts. The first part will be devoted to a brief analysis of the long run picture while the second part will examine today's and tomorrow's events in the light of the longer run forces in influencing the performance of our economy. Finally, we will evaluate both sets of these forces in terms of the business outlook.

Today's society is so very complex that it is extremely important for every firm to have some type of a picture of the environment in which it will be operating 5, 10 or 15 years from now. Your own organizations will all do a better job of planning future operations if you are familiar with the expected growth pattern of the total economy. What happens to the aggregate will influence what happens to an industry and even determine the final demand for a given firm's products or services.

Future Economic Growth Pattern

Nearly all of us are aware that the long term growth pattern of the American economy is upward. This up-

ward movement is brought about by basic forces that are of an enduring nature, which are likely to continue to operate in spite of what might happen in the short run. In other words, the evidence available leaves little doubt but that the future growth pattern of our economy is expansionary.

Before examining a few of the more important forces, I believe we should make certain we are familiar with the meaning of a growing economy. Usually, when this phrase is used, we assume that a growing economy is one that has an ever higher level of total output. This may be the case, but we should not be deceived into believing that this is necessarily an accurate measure. Economic growth should be measured in dollars with a constant purchasing power and on a per capita basis. If income and output merely keep pace with the anticipated increase in our population over the next few years, total spending will go up, and thus total business activity will increase. However, we will not experience real economic growth. Real per capita income or output must increase at a faster rate than population in order for us to have an increase in our standard of living and thus to experience true growth.

The same type of reasoning should be applied when analyzing the future growth patterns of prepaid medical service plans. If the total outlays for these plans increase at the same rate as our population or the number of families, more people will be served and an expansion in your business will take place. However, you will not be experiencing true growth. To obtain a picture of such growth, total outlays should be compared in terms of a constant dollar and on a per capita or per family basis. It is this type of comparison that really tells you how well you are doing.

What I have to say concerning the fundamental forces and our long term growth pattern is predicated upon two assumptions: The first relates to the willingness of Americans to accept change and the second depends on our ability to keep the international situation under control. Change leads to growth and, if we are to obtain the goal of our potential achievement, we must be ready and willing to accept calculated change in whatever form it might appear. As far as the international situation is concerned, we are all aware that it is possible that war could break out nearly anytime, anywhere. At the present, the near East is the critical zone. Tomorrow it could be elsewhere. Should any of these result in war, the mechanism of our society would be so disrupted that the fundamental forces could become meaningless. The assumption I make with respect to our international relations is that tensions will persist over the next 10 to 15 years, and thus we will not reduce significantly the size of our defense budget. With these assumptions as our base, we can estimate the effect of the fundamental forces and thus project the level of business activity that might be expected in 1965, 1970, or 1975.

Six Economic Factors To Be Considered

In order to project reasonable growth trends of the overall economy, we must analyze the trends of the factors that determine output. There are at least six major economic factors, or variables, that should be considered when estimating the amount of goods and services we can produce in any future period. These are: (1) the growth of our population; (2) the size of our labor force; (3) the level of employment that might be expected; (4) the expected level of unemployment; (5) the annual rate of increase in productivity; and (6) the length of the average work week. These are the variables that make up the "mix" that enable us to achieve a given level of output.

1. *Population Growth*

The story of population is always interesting in any country, but here in the United States it is doubly so because we have more accurate data upon which we can build our future projections than do the majority of the countries of the world. Prior to World War I, we added, each decade, more people to our population than we had in the previous one. This rapid growth resulted from a high birth rate, a declining mortality rate, and a high immigration ratio. During the 20's, we experienced a rapid increase in our population, and then during the 30's, the birth rate dropped and our population increased by only nine million, the smallest for any decade since the civil war. As you will recall, it was during the 30's that the idea was put forth that our population was going to level off and possibly even decline. Then World War II hit us, and this started a new population boom that is still going on. We now number over 170 million—40 million people more than in 1940, and nearly 20 million more than we had in 1950. Currently, we are adding the equivalent of a new state the size of Washington each year. According to the latest estimates of the Bureau of the Census, we may have around 206 to 209 million people by 1970, and as many as 221 million by 1975. The aggregate needs of these people will be great, and if we are to just maintain our present living standard, our total production will have to increase at rapid rates. If we are to experience true economic growth even those rates will have to be increased. The increase in our population remains a strong and dynamic force.

2. *The Labor Force*

About 25 million additional workers entered the nation's labor force between 1920 and 1955, and we now expect that another 25 million will be added by 1975. From now through 1960, the labor force will increase at a relatively slow rate but from 1961 on, it will expand with a vigor believed impossible a few years ago. By 1970, we will have 82 to 85 million persons in our labor force and by 1975, 94 to 97 million. If the armed forces remain around 3 million, the civilian workers will number 79 to 82 million by 1970, and 91 to 94 million by 1975. This compares with a current civilian labor force of 68 million.

3. and 4. *Expected Level of Employment and Unemployment*

The announced goal of our country is to maintain "maximum" levels of production, income, and employment. While no one can be certain of the level of unemployment that should be "fractional," the figure frequently used is 5 per cent. If we assume this is the figure that is politically tolerable, we can estimate the number of people who will be employed in any future period. After making the necessary adjustments for the military and fractional unemployment, we note we will

have to offer jobs to 75 to 78 million by 1970 and 86 to 89 million by 1975.

5. *Annual Rate of Increase in Productivity*

The annual rate of increase in productivity is highly important because the way we obtain total output for any given future period is by multiplying the annual output per workers times the expected number of employed persons. Since World War II, it is estimated that the annual increase in productivity has averaged about 3 per cent. From 1900 to World War II, productivity increased at a rate less than 2 per cent. Bearing these two periods in mind, it seems reasonable to assume output per man hour will increase at about the rate of 2.7 per cent up through 1975. When the billions of dollars that have been poured into research and development for technologic improvements are taken into account, this figure of 2.7 per cent seems very conservative.

6. *Length of Average Work Week*

As our production increases, there is no reason why we should not expect a decrease in the number of hours each person will work. Between 1920 and 1956, the average hours worked in manufacturing fell from approximately 48 hours to 40 hours. The same type of decline has occurred in agriculture and other industries. Average hours vary in different types of work and with the level of business activity, but I believe the average work week for all workers will be in the neighborhood of 37 to 38 hours by 1970 and 35 to 36 hours by 1975.

Projecting Trends Shows Startling Results

Now when we put these strong forces together and project the trends found in each, we arrive at some rather startling results. By 1965, our economy will be capable of producing approximately $562 billion of newly produced goods and services; by 1970, $680 billion; and by 1975, $812 billion, nearly twice the $414 billion produced in 1956. When these data are compared on a per capita basis, they indicate that the long term growth pattern of our society is extremely expansionary and thus encouraging to business interested in planning for future production and sales.

With this rather optimistic long range picture before us, it is appropriate to examine the strengths and weaknesses we find in our day-by-day operations—the short run. Such strengths and weaknesses are actually forces that will have an influence upon all expenditures, including medical services over the next six months to a year.

It should be clear that as we move toward our long run goals, the road we travel will not be perfectly straight nor will it be free of all hazards. While our modern society is really a "mixed society," it remains basically a free enterprise society and, as long as this is so we can expect, and I believe we want, some fluctuations in total business activity. The available evidence indicates a steady, uninterrupted expansion can only be accomplished within the framework of an inflationary economy, or one that is completely controlled. Although there is disagreement over the social cost of creeping inflation, nearly everyone is anxious to avoid a regimented state. I believe that our society is strengthened more by a periodic downturn in business activity, of minor proportions, than by a gradual, continuous insidious erosion of the purchasing power of the dollar.

Forces Influencing The Stock Market

Before discussing the various spending segments of our society, a word about the recent behavior of the stock market is in order. In the eyes of many, this highlights the important weaknesses of our economy and, therefore, should be reviewed in a talk of this nature.

An examination of the historical data collected and analyzed on the behavior of the stock market tells us that stock market prices usually precede an upturn or a downturn in general business activity. While the record of this indicator is not perfect, it has been classified as a so-called leader in business cycle analysis and deserves some attention. There is no single reason why stock prices have been tumbling. Several forces have been working simultaneously and together they account for the almost uninterrupted decline in stock prices since last July. A few of the forces having an influence on the stock market are:

1. Higher interest rates. Investors find it less risky and nearly as profitable to switch out of stock equities into bonds or other forms of saving.

2. The decline in corporate profits. While this decline has been small, it has been rather steady since the 4th quarter of 1956. Although dividend payments have remained about the same, retained earnings have been reduced.

3. The decline in new orders of manufactured goods. This decline has occurred with no perceptible decrease in production. The result has been a decline of unfilled orders of corporations and thus some concern on the part of the investors.

4. Concern over the international situation. In the eyes of many, our foreign relations have deteriorated and thus, the danger of war is more imminent.

5. Sputnik itself should not be overlooked as a factor bringing instability to the stock market. This coup, accomplished by the Russians, has placed doubt in the minds of many investors. Doubt usually leads to caution and conservatism as far as the stock market is concerned.

6. Concern over the cutback in defense spending. Much publicity has been given to lay-offs in defense plants and the expected reduction in military expenditures. Such publicity dampens the enthusiasm of investors. The possibility of an increase in military spending has just developed during the past week.

7. The rate of increase in capital expenditures has declined. The leveling off of capital expenditures reduces the need for new stock issues and this acts as a depressant on the market.

8. Psychologic reactions to declining stock prices. As stock prices decline, recession psychology spreads and the effect becomes cumulative and prices drop still more. Fearing further decline, investors sell to either minimize losses or, if they had purchased at previous lows, to get out with some profit before all their gains are eliminated.

While it is unlikely that any of the above forces would be of sufficient strength to carry the market to lower levels, taken together they do give us an answer as to why the market has been moving downward over the past three months.

Usually, when the stock market behaves in such a manner, more fundamental weaknesses are to be found. What is the situation as of now and what are the possibilities over the next six months to a year? Whether our strengths exceed our weaknesses will depend upon what happens to spending—spending by businesses, governments, and consumers.

Business Spending

Expenditures by businesses for new plant and equipment have peaked and are on the decline. These outlays have increased approximately 33 per cent since 1955, and we have evidence they will drop slightly in the fourth quarter of this year. Recent surveys of business plans for 1958 indicate the reduction in capital spending is likely to continue well into next year. The reason for the decline in this type of spending is tied in closely with the squeeze on profits which has been occurring in most industries along with the developing of excess capacity in some lines. According to the study of the Securities and Exchange Commission and the Department of Commerce, the expected decline in capital spending is quite general. The only two major industries planning to increase capital outlays during the last quarter of this year are public utilities and non-durable manufacturing. In total, expenditures of this nature may be reduced as much as 5 to 7 per cent next year—a significant reduction in the light of the importance of this type of spending. Surveys by private business advisory services and by business publications support this view and, thus point up an important weakness in the short run economic picture.

Another area of business spending that plays quite an important role in determining the level of activity is the amount spent to build up inventories. We have been producing more than we have been consuming ever since the beginning of 1955 and, as a result, total inventories currently stand at over $91 billion, an all time high. Although sales have increased, they have not been able to keep pace with the inventory build-up and with the businessman concerned over future sales the way he is, I cannot help but conclude that purchasing for inventory purposes will slacken off in the months just ahead. If inventories do decline or if the rate of increase falls off, this will become another weakness in our total spending picture.

On balance, in spite of the optimistic long range picture for increased business activity, I believe business spending will be reduced by 2 to 3 billion dollars during 1958. The tightened monetary and credit conditions and the lower profit margins are discouraging to business and many capital expansion plans are being abandoned or postponed. Of course if the government should increase its outlays for defense purposes, this tendency might be reversed in short order.

Government Spending

While we have read and heard a great deal about the expected reduction in Federal Government expenditures, total outlays by all levels of government are likely to increase in 1958. During the current year, these expenditures will probably average out to about $86 billion and will end the year at a rate around $88 billion. I expect that total government outlays will approximate $90 billion during 1958. The two factors that lead me to this conclusion are: first, the cuts we have heard about are cuts in obligational authority, not in spending. Spending by the Federal Government will be up to $2.5 to $3.0 billion in 1958. This will be brought about primarily by increases in outlays for interest payments on the government debt, the new housing program, higher retirement provisions for both civilian and military employees and increased outlays to conduct our international affairs. Second, a rise of about an equal amount can be expected in the expenditures of the states and local governments on roads, schools and community facilities. All told, government spending remains a very positive force influencing the level of employment. While the rate of increase in such spending is likely to decline, falling from the 8 per cent increase in 1957 to about one-half that amount in 1958, the absolute outlays are likely to up by about $4 billion.

Consumer Spending

What happens to consumer spending will depend upon what happens to consumer income. At the present, there are some indications that incomes are declining slightly. During September, wage and salary disbursements dropped approximately one-half billion dollars. While the data are not, as yet, available for October, I believe the record will show that a similar decline occurred. Should this downward drift in incomes continue, we will be in for a more stringent 1958 than has been forecast by most observers. The effect of a decrease in the rate of spending by business for plant and equipment and by the Federal Government is just beginning to be reflected in lower incomes of our wage and salary workers. Unless these expenditures are stepped up, it is likely the decrease will have a multiplying effect and 1958 will see incomes falling below this year's peak.

Consumer expenditures amount to about 64 per cent of the total spending of our economy and are usually classified into the categories of housing, durable goods, non-durable goods and services.

Expenditures by consumers for home construction have slumped for the last two years. The peak was reached in 1955 when $16.6 billion were spent on residential non-farm housing. In 1956, this sum fell to $15.3 billion and this year, it will average out to around $14 billion. This slump has been the result of rising construction costs, more expensive mortgage money, and a declining number of family formations. As has been pointed out, the World War II babies will not begin to have an impact upon our adult markets until sometime after 1960. Prior to that time, the basic demand for housing will remain relatively low, and it will only be through the stimulus of easier terms and lower prices that more homes will be built. Total outlays for homes during 1958 are apt to remain somewhere around the 1957 level with the current trend toward larger homes and higher prices continuing.

The slow-down in the rate of increase in consumer income is apt to have the greatest impact on the sales of consumer durable goods such as automobiles and appliances.

Automobile sales account for nearly 50 per cent of all consumer durable goods purchases. Sales this year will probably exceed 6 million which is well above the 1956

figure of 5.8 million. What happens in 1958 will largely depend upon the reception consumers give the new models that are just now being introduced. I believe consumers are not in a mood to buy the new cars at a rate anything like they did in 1955. Sales will probably equal or even exceed the 1957 level but, unless manufacturers cut prices, they will not be high enough to equal the 1955 record. Reports on sporadic unemployment and high prices have been enough to convince many consumers this is not a good time to buy. The most recent surveys of the Survey Research Center of the University of Michigan support this point of view and indicate consumers will hold off any purchases requiring large cash outlays or loans.

Sales of other consumer durables such as TV sets, radios, refrigerators, and washing machines are not apt to increase greatly over the next year. Credit is available for such purposes, but the problem remains one of stimulating the purchaser. Prices are high and the feeling of uncertainty is in the air. The desire to buy is not present and unless action is taken to restore some of the confidence that has been lost, 1958 will see concerns more actively competing for the trade dollar. Total outlays by consumers for durable goods will approximate $46 billion this year. While this is above the 1956 figure, it will not equal the 1955 level. In spite of the fact that credit is available and many of the purchases made in 1955 will be paid off in 1958, I believe the mood of consumers will prevent durable sales from exceeding the $35.6 billion of 1955.

Consumer spending on non-durable goods and services may continue to increase during 1958. So far this year, they are running ahead of 1956 by about 5 to 7 per cent and it has been this increase that has offset the lagging sales of consumer durables. Studies show that consumers do have money and I believe 1958 will see additional increases in sales of non-essentials the same as I expect outlays to go up for food, clothing and services.

Conclusion

As I evaluate the strengths and weaknesses in the total economy, I believe the prospects are for a high level of activity during 1958. However, the short run forces working are very likely to hold aggregate spending below the 1957 inflationary level.

We have pointed out that the long term forces are strong and point toward an economy of nearly twice our current output by 1975. This does not mean, however, that every year will be always higher than the one that precedes it. It seems likely that the continuous rise in prices will be stopped during the latter months of 1957. We have ample supplies of goods and with profit margins on the decline, business competition for the consumer dollar will become more vigorous. Unless the government takes some action to increase its own outlays over and above its currently planned expenditures or unless businesses spend more for investment purposes than is currently planned, personal incomes are likely to decline and unemployment during 1958 is apt to show a slight increase. We have been operating with an economy that is more than fully employed and, as a consequence, prices have been rising quite steadily since April 1956. If we are to really lick inflation and enjoy price stability, it seems to me we want to experience periods of less than over-full employment. I believe 1958 is very apt to be one of these periods.

In my opinion, the type of adjustment I see for the coming months is the type a free enterprise economy must experience if it is to remain really healthy and, at the same time, free.

The Physician—Then and Now

IRA C. LAYTON, M.D.
Trustee of
Surgical Medical Care Plan
Kansas City, Missouri

It has often been said, "Better to remain silent and be thought a fool, than to speak and remove all doubt." Were I to proceed with a discussion of national economics, world affairs or sociologic principles, I am sure any semblance of doubt you might have would be promptly removed. Far better trained and more capable individuals in these fields have spoken to you today and will continue tomorrow.

The effects of economic, sociologic and technologic changes in recent years have been great upon the profession of medicine. I would call to your minds the famous painting by Sir Luke Field entitled, "The Doctor." This work is familiar to all of you and I am sure certain conclusions have been drawn from having observed it. You will recall the attendance of the physician upon the child of a family, apparently not well endowed with material goods. The lack of carpet on the floor, the formation of a bed for the child from dissimilar chairs, and the attire of the anxious parents in the background lend great appeal to the message contained in the picture. The child apparently is seriously ill, at least sufficiently so to warrant the physician's attendance in the dead of night. The pallor of the child would speak for serious illness and the obvious concern on the face of the physician would lend further support to this assumption. It is difficult to determine from the face of the physician whether what we see there is sadness, perplexity, or resignation. We are assured, however, from his appearance, that there is dedication of purpose in his attendance on this patient, regardless of his limitations in diagnosis and treatment. The withdrawal of the parents to the background, consoling each other, and placing in the physician's care their most prized possession, the child, speaks of their trust and respect for this member of the profession, in spite of the fact that his chief assets are those of sympathetic understanding and availability.

A present-day version of this famous painting might

show the child between starched sheets in the ward of a modern charity hospital. The physician would not be seated pensively at the bedside; rather, a nurse at the desk in the hall would be in attendance. An intern or resident might be standing by viewing essential laboratory studies; but the physician's aura of inate dignity could not be made such an apparent part of the present-day picture. In the eyes of his patients, the modern physician often appears to have lost those virtues of sympathetic understanding and availability for which his predecessor was so highly esteemed.

Why Modern Physician Has Lost Respect

Why is it that our modern physician appears to have lost, at least in part, the admiration and respect of those who come under his care? Certainly a myriad of possible answers come to mind. I would mention only a few.

Twenty-five or thirty years ago, less than 15 per cent of our adult population were high school graduates. Today, that figure aproaches 50 per cent. With a higher level of public education, and the popularity of medical articles in leisure time magazines, medical advances have become common knowledge. It is entirely understandable that the public, knowing of modern medicine's accomplishments, demands their application to illness even though ability to pay may not be great. The average layman has, at least in his own opinion, acquired sufficient information to justify critical appraisal of his medical care. Such an attitude would rarely have occurred in the practice of the doctor depicted by Sir Luke Field. Few of his patients had the education and even fewer available information with which to form a basis for critical evaluation. The physician now may find himself at a loss to answer in a satisfactory manner, questions proposed by his patient. And, unsatisfactory or incomplete answers are less readily accepted today. With the advent of fine roads and rapid transportation, medical centers are available to almost all parts of our country. The ready availability of the best facilities and techniques of medical science have tended to lower the stature of the family doctor. The advancements of medical science itself have created a problem in patient-physician relationships. The patient's family is no longer quite so ready to accept the inevitable and, again, the physician himself is criticized for failures in matters beyond his control. Demotion of the physician from his previous unassailable position has made his footing less secure and, in many instances, made the physician feel defensive in his relationship with the patient. This, in turn, contributes to the chain of lack of understanding. The physician knows the high quality of the care he is offering and, understandably resents his patient's lack of appreciation of this, not only during illness, but at the time a bill is submitted.

The high cost of medical care has been interpreted by the public to mean the high cost of physician's care. Only the rare occasions when an excessive fee is charged become public knowledge. The many expressions of gratitude for consideration of their economic state by patients to their physician are rarely publicized. A number of years ago, much of the practice of medicine was carried out in rural circumstances where the physician knew well the economic and social background of all his patients. He was called upon to attend and answered that call, regardles of ability to pay. Then, taxes on individuals were not great and the welfare state was not yet upon us. Instead of large charity hospitals with high taxes supporting them, and in the place of Social Security benefits, the physician was obligated to take care of both the indigent and the wealthy. Both he and his patients recognized this and those individuals who could pay, and particularly those who could pay well, were not so burdened with taxation but that they accepted an increased charge for his services in order to compensate him for those members of their community who were unable to pay him at all. A wide divergence of fees often existed for similar services, based entirely on the ability of the individual to pay. This was a form of medical care for the indigent at the local level.

In more recent years, many of these services for the indigent are tax supported. Some are supported by charity fund drives. In view of the rather large contributions made through taxation and charitable gifts by the well-to-do, it is small wonder that they have begun to resent extreme variations in charges by the profession. On the other hand, there are fewer of our population now who are unable to pay a modest or even reasonable fee for the doctor's services. I would not maintain by these statements that a fixed fee schedule in the practice of medicine is a desirable entity. I would, however, point out that over the past 20 years the charges a doctor makes for his services have gradually become more uniform although they are frequently reduced for the individual who can pay little, and increased moderately for that individual who can afford it. Little variation in fees charged for the office services of general practitioners, internists, and pediatricians, now exist.

Practice of Medicine Has Changed Through the Years

Even for the seriously ill the advent of relative value fee schedules, Blue Shield fee schedules approved by members of the profession, and reimbursement schedules provided by the commercial insurance companies, have all tended to result in some standardization of fees. The physician, when dealing with an exceptional case, either because of the magnitude of the services rendered, or because of the individual's ability to pay, sometimes has strong objections to the results of these standardizing effects.

Other aspects of the practice of medicine have changed through the years. Referring again to "The Doctor," we note that attendance is being provided for serious illness in the home. Improved transportation, increased prosperity, and other factors have made this a comparatively unusual situation today. We have seen the growth of a multitude of hospitals in all sections of our country in which proper care of the seriously ill can be conducted. The nature of hospitals has changed. Twelve years ago, when I began the practice of medicine, it was not unusual to find an elderly patient who, even though critically ill, refused hospitalization. Their concept of the hospital was still that of a place in which people could die. Such an attitude today is exceedingly rare. That such an attitude ever existed indicates the change that has taken place in our medical institutions. Advances in hospital care, desirable as they may be, have also been the source of changes, not always readily accepted by the practicing physician. The time appears to have passed when wishes of the medical staff are granted without question. Again, the advent of expensive equipment,

the coming of a high level of prosperity, increased labor costs, and the demand for increased hospital beds have placed the hospital trustees in a precarious economic position. To help them solve their problems, there has been developed the trained hospital administrator. His responsibility, basically, is to the trustees of the hospital. His job is to operate the institution on as nearly an economically sound basis as is possible. Often, this leaves little room for consideration of medical staff requests. The physician finds it difficult to understand the intervention of dollar economy where the care of this patient is involved. Although the basic goals are the same, divergence of views has inevitably led to conflict in many areas. The mutual dependence of hospital and doctor is too often forgotten. The need for hospital funds has led to many practices repugnant to some physicians. Fund drives are almost invariably begun with a high assessment on the individual staff members. Whether or not coercion is intended, its possibility is apparent to the physician. Hospitals left with many unpaid accounts have turned to collection agency methods of solving this problem. Earlier and more vigorous collections by the hospital may deplete the patient's funds leaving little or nothing to reimburse the doctor for his efforts and the resentment of the patient for having to pay a bill which he did not wish to incur in the first place is often turned toward his doctor. In such circumstances, the physician feels obligated to accept deferred or token payment under the guise of good public relations.

In the large hospital, the myriad of departments have often led to inefficiency in coordination to the detriment of the patient and the anxiety of the physician. The doctor whose office revolves around him as a central figure may often find little of this attitude while caring for his hospitalized patients. He has neither time nor understanding with which to meet these frustrations when they occur. In this area, as in his relationship with the public, prosperity, technologic advances, and sociologic change have placed the physician again in a defensive position.

Superficially, the medical profession has appeared to keep pace with inflationary times in so far as individual income is concerned. In the vast majority of instances this does not reflect a substantial increase in fees. It does reflect an overall increase in demand for service and an increase in the average individual's ability to pay the physician's bill.

This increased demand of our public for more medical care, for the application now of medical advances known to them, is well documented and is regularly felt in the halls of Congress. The demand is apparent in the numerous bills dealing with the health and welfare of the voting public. The average doctor has little knowledge of the tremendous number of bills considered each year by committees of our governing bodies. Any one of these, if successfully sponsored, would further propel our profession along the road to socialization. Contrary to popular belief, it has apparently made little difference which party is in power.

Formation of Blue Shield Plans

Fifteen years ago a system of government sponsored involuntary health insurance seemed a real threat to each practitioner. Fear of this threat and a real desire on the part of a few, far-sighted physicians to provide middle income groups with a means of pre-paying medical care, led to the formation of Blue Shield Plans throughout the country. With the passage of time and the advent of a new generation of young doctors, awareness of the threat of government intervention in medicine has been dulled. Prosperity has eliminated some of the necessity of assuring the physician of the collection of his fees and to some physicians, that same prosperity has eliminated the need for prepaid health insurance. Rapid growth of Blue Shield plans, attesting to public demand, has necessitated many changes in the original form of plan operations. It is often impossible to keep the participating physician well-informed of changes as they occur and the reasons for their occurrence. These frequently have the appearance of encroachment on his individuality and the free practice of medicine. All too often, Blue Shield gives the superficial appearance of being an interferring third party in medical practice rather than a helpful adjunct of the medical profession. Little time is available to either Blue Shield or the physician with which to further professional understanding of changes as they occur.

It is essential for the welfare of the profession that voluntary, profession-sponsored, prepaid medical care plans continue to expand. Personal prejudices must be put aside. In another part of this country, I recently had occasion to meet with the Board of Directors of a state-wide Blue Shield Plan. The chief problem at this meeting was the comparatively selfish approach of one specialty group in its attitude toward Blue Shield. Feeling that its services were under-valued by the fee schedule, this group appeared determined to improve its own economic position or cause hardship for the entire Plan itself. Such attitudes are not consistent with the best interests of the entire profession. Efforts to utilize Blue Shield Plans for the furtherance of the economic desires of small portions of the profession must be met with firm resistance. Such changes must come about through public education and not behind the skirts of an essential facet of the practice of medicine.

How does the doctor's attitude toward Blue Shield compare with that he holds toward the commercial insurance companies? Unfortunately, through lack of proper information, too many of the profession are not aware that a difference between the two does exist. Too often, the physician sees only a high-grade commercial contract carrying a generous fee schedule and is unaware that such a contract is not available to the general public. He wonders why Blue Shield cannot equal these offerings. He hears complaints from patients when additional charges above the Blue Shield allowance are made. Seldom is a complaint registered from a patient who carries a commercial contract, for in this instance the patient does not anticipate that his bill will be paid in full. Through lack of knowledge and a narrow exposure, the doctor's feelings toward Blue Shield are often warped and in the wrong direction. Selection of risks, limitation of fee schedules and many other commercial insurance company practices are not known to him. It is imperative that as many members of the profession as possible be drawn into the operations of Blue Shield Plans for in his way, better understanding of insurance principles, basic aims and other problems may be gained. The young physician is comparatively unaware of the

threat to the practice of medicine by the intervention of other third parties. The vast majority of these men, differing from their predecessors of 15 or 20 years ago, are married and now have families. They feel a responsibility to spend time with these families and are reluctant to share time away from their medical practice with such institutions as the County Medical Society, Blue Shield, or civic organizations. Yet, only through participation in such bodies by these young men can the welfare of medicine in the future be assured.

Recent years have seen the advent of many innovations in the practice of medicine. For the most part, these have had little influence on much of the medical profession. The development of the clinic as a means of medical practice has affected small segments of the profession surrounding such installations and in these areas I am sure resentment can be detected. Yet, such institutions have not caused the layman to abandon his family physician. Group practices of both mixed and specialty nature have had similar effects, as they have developed. More and more, new and different third parties seem to interpose their reams of questionnaires between the patient and his doctor. Closed panel practices, sponsored by Unions or employers, have drawn little attention except in the areas in which they operate. We must face the fact that the individual physician is concerned primarily with the conduct of his practice and the care of his patients. In this day and age, that is a full-time job leaving little opportunity for consideration of outside influence, except, when they affect that practice. Perhaps my experience in this respect is somewhat neglected by virtue of my Midwestern location. Most of these practices, that is, the closed panel, the union and employer, third-party intervention, have not become large factors in this area. An exception to this lies in that most recent development of governmental medicine, Medicare. Having been in effect for approximately a year, the individual physician's exposure to such cases has been so small in many areas as to attract little of his attention. His interest in these matters is largely a philosophical one and among the younger members of the profession, a wait-and-see attitude seems prevalent.

Resentment of Loss of Professional Art

To return to "The Doctor" of Sir Luke Field, one might envy certain aspects of his practice of medicine. His services frequently were more artful than scientific. His isolation gave him autonomy and enhanced respect from the community. He was not troubled with multitudes of insurance forms for every hospitalization. In fact, hospitalizations were few. His economic reward varied according to the economic level of the community he served but was consistently high within that community. When his patient required hospitalization, all too often it was because the end was near and families had to be relieved of their burdens. In the hospital, he was not so sorely pressed by the dollar-conscious hospital administrator. Prepaid medical care was little known and insurance forms or medical-legal reports occupied little or none of his time. He was entitled to retain a vast majority of his earnings to provide for his own security. Cradle to grave protection had not influenced his patients.

These are laudible and desirable assets but I doubt that many of us would return to those times. None would desire to sit by the side of a sick child without the aid of modern antibiotics, diagnostic tools, or other components of modern medicine. Medical advances, as well as general social-economic advances, have produced changes in the practice of medicine. Many of these changes have made life more complex for the physician and his patient but many of them have made life continue. It seems impossible to me that old attitudes, old prejudices, and old opinions can successfully persist in the face of such change; yet, much of the public and the profession too, resent the loss of professional art though they would not relinquish the scientific gains.

The Doctor of the portrait is gone. His humility and sympathy remain with the profession. Pressed for time by patients, his community, hospitals, insurance forms, and a search for security for his family, these qualities are often less apparent to the public.

Conclusions

It is possible that some of these remarks might not bear the test of statistical analysis and close scrutiny. They represent my opinions, formulated from observing my colleagues in the practice of medicine and from my own relationship with patients I serve. From these observations, however, I have drawn certain conclusions. These might be enumerated as follows:

1. Changes in the economic practice of medicine have occurred. For the most part, they have occurred as the result of extraneous forces upon that practice rather than as a result of physicians' efforts to adapt to changing times. They have, for the most part, been forced upon that practice rather than as a result of physicians' efforts to adapt to changing times. They have, for the most part, been forced upon the profession rather than sponsored by the profession. For this reason, these changes sometimes are not well-received by the physician.

2. The practice of medicine has now become involved with a multitude of institutions and individuals including federal and local governments, unions, employers, commercial and profession-sponsored insurance plans, and many others. In the course of his training, the physician is not prepared to understand the effect of such institutions. They seem to interfere with his practice of medicine and, as a result, are sometimes condemned by him.

3. The practicing physician often has little knowledge concerning the demands of the public for means of insuring their medical care. Lack of knowledge of these demands makes him suspect those individuals and institutions who seek to supply means to satisfy these demands for the public. Those physicians, particularly who have entered in the practice of medicine in recent years, are quite unaware of the service rendered by Blue Shield in the prevention of a system of government medicine. These younger individuals, many times, suspect that perhaps the danger did not exist in the first place.

4. Finally, most physicians seem to wish to be left alone to care for their patients. They do not enjoy or appreciate questionnaires, insurance reports, medical-legal reports and other time-consuming, nuisance factors in the practice of medicine. The training of the physician leaves little opportunity for the installation of knowledge which would lead to interest in civic affairs. Even the profession's own organizations suffer from the physician's lack of time and interest for matters not pertaining directly to the care of his patients.

Remarks of Mr. Charles A. Sprague

EDITOR AND PUBLISHER
The Oregon Statesman
Salem, Oregon

I am not sure that a newspaperman really has any place in an organization composed very largely of doctors because, publicity and medicine have no affinity for each other, so we have been instructed time and time again.

Nevertheless, I have yielded to your appeal and am going to talk to you as best I can on this subject of Health and Welfare. That subject reflects a very close unity—health and welfare. Human welfare is in a large degree dependent upon health. And surely the great advance in the welfare of the people has come from better health as a product of better medical care. This progress is one of the most notable achievements of our age.

I shall not try to quote statistics to you, but merely mention some areas of progress such as the reduction in infant and maternal mortality, the growing eradication of infectious diseases, the better record in surgery, the shortening of the period of hospitalization. New techniques, new drugs like the antibiotics, better trained personnel—all have contributed to this rapid march of progress. We may not have the earth satellite, but we have the Salk vaccine. The West may be tardy in its missile development, but it was first with sulfa drugs, insulin, x-rays—made to save lives, not to destroy them.

Health has become almost a religion of the people. They pour millions into gifts to combat diseases, and establishment of medical foundations is a favorite indulgence for the very wealthy.

Most of these forward steps came as a result of scientific research. Chemists and pathologists working in laboratories have made life-saving discoveries. But it is the men actually and actively engaged in medical practice who have applied them. To make sure that proven formulas and methods are brought to the attention of those in practice, clinics are held and refresher courses offered. By this means and through professional literature the doctor caring for patients is brought abreast of progress. The one who is indifferent lags behind and soon finds he is left in the eddy while other and more progressive men in medicine move forward.

Doctors Fail in Field of Public Relations

But while the medical profession has thus been seen to be fully alert to progress in its own field, ready, with discretion, to try the new and to accept it if the trial justfiies, it seems to me as a lay observer that the medical profession has let itself be strangely isolated from currents of thought and actions in other fields in social, political and economic affairs.

If these remarks are directed, or appear to be directed, more to the doctors in this audience rather than others such as management representatives, it is because the latter, thanks to the New Deal and labor unions, have been pretty well house-broken by this time.

Whether this lag with the medical profession is due to their concentration during medical training and the constant narrowing of the range of their study, or to the insulation which comes with private practice, I shall not attempt to say. Doctors are pretty well out of the stream of the business world with their workday—and night—contacts confined largely to the ill and their relatives, and to nurses and staff. And so the conspicuous failure of the medical profession has been in the field of public relations. The result was a professional introversion, or to change the figure, a myopia which reacted to injure the standing of the profession in the eyes of the public.

Medical Societies Resisted Change

Thus there developed in medical societies a stiff resistance to deviation from traditional procedures in the practice of medicine. A renegade from the old code would be subject to harsh discipline which served usually to hold him in line. The medical profession seemed oblivious to social and economic changes which were having an impact on political thought and action. It was not until the threat of socialized medicine became ominous that the profesion, as a profession, bowed in measure at least to the pressures of the times.

This professional conservatism found expression not only within the medical organizations on matters relating to medical practice, it sometimes linked individual doctors with extreme political reaction.

I suspect that doctors were as big purchasers of John Flynn's book, The Road Ahead, for mass distribution as any group. I know that Oregon was well flooded with these books from such sources. I pride myself on being something of a conservative, still registered Republican, but this book was so extreme in its reaction against the prevailing political trends as to damage its own cause. Its wide distribution by doctors was to me just another proof of what suckers many highly intelligent men may be. And corporation executives, I found, are often fully as gullible in the support of lost causes.

It was this joining of hands against any change which brought medical societies into disrepute. The AMA, as you know, was accused of being the tightest labor union of them all. A doctor with a Cadillac provoked resentful comment about the high cost of medical care, although no one thought to criticize a gyppo logger, suddenly grown affluent enough to acquire a car of similar make. On popular vote the medical profession probably still would rank higher than the legal profession, but the margin has narrowed.

Doctors Must Adapt to New Era

What doctors have had to learn—and some have not learned yet—is that we are living in a new society to which they must adapt themselves and their policies. We are in an era of what I call socialization, which is not to be confused with socialism. Socialism is where the government steps in and runs the show. Society though is becoming more fully organized, and socializa-

tion reflects the tendency of groups to organize themselves for their own interests.

The shift from rural living on farms largely self-contained, and from business independently owned and operated to urban and corporate organizatoin has forced this socialization, which is simply the organization of individuals with similar interests to promote their common welfare. That may be a business corporation, a labor union, a trade association—or a medical society. Your medical society has definite purposes, and you invoke its power to represent you in matters with which you are concerned.

Doctors are apt to regard the medical society as strictly professional, the conservator of a great inheritance and guardian of the nation's health. It is that; but the public also regards your society as another self-interest group, concerned with private economics as much as with medicine. You have a perfect right to use your society to protect your economic welfare, but do not gloss that phase of it with the halo of Pythagoras.

Two Socializing Trends To Reckon With

There are two socializing trends which you have to reckon with; one is the socializing of disasters. This is old, a development of the Tontine Principle, expressed now vigorously in fire, life and casualty insurance. It involves the spreading of risks according to the law of probabilities and the provision of a reserve pool to meet emergencies and losses. Sickness, in view of the cost of major illnesses, rates as a family disaster. And so it was natural for the insurance idea to spread to sickness and accident. The increase in the number of wage and salary workers made practical the collection of insurance fees at regular intervals, and when the payroll deduction plan was thought of the prepayment plan then became feasible.

I congratulate the doctors of Oregon for being among the earliest in the medical profession to observe the trend and to try to travel with it. It is a matter of satisfaction to me personally that our business was one of the earliest to become affiliated with the local Physicians and Surgeons Medical Service in Salem.

It is true that doctors were pushed into such organizations by the competition of privately-owned and managed groups of medical care practitioners. But these doctors in Salem and elsewhere were real pioneers. They had to tread the path of society approval—Medical Society approval—and still have enough of a sales appeal to interest consumer groups. The Oregon success has encouraged similar efforts elsewhere.

Another of the trends which must be recognized is group dealing. Prepaid medical plans are offered first to large groups. Medical groups now must deal with other groups: hospital associations for instance, and with the sponsors of other group health plans, private insurance and union-sponsored health and welfare plans. Doctors certainly have a stake in the greatly expanded sale of health insurance by private insurers.

This expansion in private insurance is of mixed value, however. If misunderstandings arise from overselling of solicitors, or clouding of exclusions, or limitations in these insurance contracts, then prepaid insurance of that character suffers and doctors often get blamed unjustly.

Now I understand the consuming fear over socialized medicine. Fortunately, that is not an immediate prospect. The British experience chilled its popularity, but the idea is not dead and will be revived under a favorable climate. Doctors' security from the coils of government bureaucracy depends in great degree on how well they meet the health needs of the people in terms of today's social and economic conditions. And certainly, for my part, I approve of the conditions which Dr. Miller mentioned: namely, free choice of physician, and the doctor's choice of the character of treatment.

High Cost of Medical Care

You are aware I know of the complaints about the high cost of medical care. On analysis, this is not the ogre which is depicted in popular literature. The high cost of medical care stems in large part from the greater consumption of medical and hospital attention. Babies are not born in homes now but in hospitals. Alas, we will have no more log cabin presidents. Though homes are much better prepared for care of an ill person, the sick are promptly rushed off to hospitals and that incurs a new and very substantial expense. In fact, the increased cost of hospitalization adds greatly to the rise in the cost of medical care. Today more technical services are furnished: x-rays, physiotherapy and so forth at cost to the patient. Many of the new drugs seem frightfully expensive.

What is ignored in complaints about the cost of medical care is that health of the public is greatly improved in consequence. Lives are saved; illnesses are shortened; and the fact remains, according to the statisticians, that the outlay for medical care—doctors, drugs, hospitals—runs at a fairly constant ratio of 5 per cent of the national income. One difficulty is that the burden is extremely heavy sometimes on individual families for prolonged treatment and hospitalization. Expensive drugs or surgery bring a staggering pile-up of bills. For the very poor, public welfare extends a hand. It is the not-so-well-to-do who really are hard hit then. For such families prepaid health insurance comes as a life-saver. What is important, however, is that the purchaser of such insurance know definitely what he is buying. In that respect those prepaid plans which offer definite services rather than specific indemnities by categories should have a marked advantage.

Lower Cost by Open Panel Practice

But cannot something be done to lower the cost of medical service without lowering its quality? One suggestion is made such as the organization of group practice with general practitioners and specialists operating as a unit, providing diagnosis and treatment within a single organization with a definite purpose of reducing the cost to the patient. I am not referring to what are called closed panels, but to the open practice.

I know that much store is set on the confidence of the patient in his physician, and that seems to encourage strict individualism in practice. But let me say that there is considerable myth in that. Actually, the patient has only limited confidence in his family doctor, as is proven by this fact that unless the doctor's prescription brings fairly early relief the patient calls for a specialist, and he shows a lack of confidence in his doctor, or he goes to another doctor. And specialists are chosen chiefly on the recommendations of the general practitioner. Many a patient undergoes surgery at the hands of a doctor who has been selected for him, not chosen by him.

And so group practice is not invalidated by the factor of a free choice of a doctor.

Here at least is an opportunity for further experimentation.

Hope for Growth in Awareness

Now if I have seemed critical of the medical profession in this discourse, let me assure you that I am not hostile to it. In fact when it comes to the practice of medicine and surgery, I am strictly orthodox in my loyalty and patronage. I have a great respect for those who engage in the practice, though I confess at times (although perhaps it is an indication of advancing age), that I fear the commercial side gets over-emphasis and the deeper function of ministering to human need is diminished, particularly among the younger practitioners. It should always be a profession of service with financial reward as secondary. Likewise, administrators of prepayment plans must always keep the service idea paramount and not be overborne by concern over budget and balances.

It is my earnest hope that the medical profession will grow in awareness of the conditions of this modern age, and without sacrifice of the essentials of the profession which are in their custody, will make such adaptations as will best serve the health and welfare of the American public, joining hands with other groups for conserving the health of the people.

The Relative Value Fee Schedule

FRANCIS J. COX, M.D.
Chairman, Committee on Fees of the
California Medical Association
San Francisco, California

It was with a certain amount of misgiving on my part that I accepted your kind invitation to address the Western Conference of Prepaid Medical Plans on the subject of medical fee schedules. After many years of hard work on this particular subject it is my firm conviction that it is a complete and total impossibility to create any fee schedule for payment of medical services. On the other hand, it is completely self evident that if prepaid medical insurance is to be offered in any form, there must by correlary exist a system under which payment for individual service on the part of the participating physician must be pre-determined. Whether physicians approve or disapprove, therefore, in principle, it remains a fact that we are going to exist and work with a fee scedule from this point on.

It would be trite in addressing a group like this to review the changing social trends which have created this situation in the United States and throughout the world. I do not see how it is possible ever to anticipate any radical revision, or alteration, in this shifting social attitude. It is imperative, on the other hand, that we make every effort possible to guide these social trends correctly towards the best welfare of the public and the individual patient involved. Let me assure you that there was no selfish motive on the part of any member of the committee which produced the Relative Value Schedule for the California Medical Association published and adopted by the Council on February 12, 1956. There was a background of many, many years of intense effort and serious thought behind that work.

The objective of the commitee on fees of the California Medical Association which produced the Relative Value Schedule was to establish general principles for the formulation of proper fee schedules. The committee determined that four basic elements must be included in such general principles.

Uniform Nomenclature

A single description of medical services that should become common to all fee schedules was considered of paramount importance. The committee, therefore, created a nomenclature suitable for uniform use.

The background behind this principle is of interest. As you know, in California we have been working since 1912 with a fee schedule, one produced to act as a guide in payment for medical services under the Workmens Compensation Act. As the years went on this Act came to encompass more of medical practice than injury alone. Therefore, the schedule had to be expanded to compensate. From this pattern many other schedules of fees were created and placed into operation to serve in other types of plans for prepaid medical care. A schedule of fees had to be created, for example, for the California Physicians' Service. Schedules of fees had to be created for operation of various and sundry programs of State and Governmental prepaid medical care. After World War II tremendous expansion in this field developed through negotiations between labor and management in the health and welfare fringe benefits. The public generally became much more interested in utilization of the insurance principle for prepayment of private medical costs. Blue Shield and Blue Cross expanded rapidly and private insurance companies entered the field in very active fashion.

In each and every instance, as a new prepaid medical plan was created, existing fee schedules were either adopted, altered or expanded to meet the needs of the particular plan in question and each individual fee schedule was altered to conform to the immediate problem facing the administrators of that particular plan. As a consequence there were almost as many different fee schedules as there were plans for furnishing medical care.

Over the past 15 to 20 years there have been repeated efforts on the part of the California Medical Association and its committees to produce a schedule of fees which would properly reflect the practice of medicine as it exists and properly protect the interests of both patient and doctor. I can recall vividly a meeting in Los Angeles at which we made an attempt to compare 22 different fee schedules existing in the State of California. We spent two days at the effort and finally threw up our hands in complete disgust. We found that there was no rational basis on which any comparison could be made between any two of the 22 schedules we had in front of us. One of the fundamental dificulties was the marked variability in nomenclature.

In order to attack our original problem, therefore, we sought out a method of procedure. The National Blue Shield-Blue Cross Actuarial Manual seemed to offer more help than anything in existence up to that time. Therefore, we used it as our guide.

The Blue Shield-Blue Cross Actuarial Manual, however, had many inadequacies for the solution of our own individual problem. It did not include pure medical services. Therefore, we had to create a new listing of medical services, as contrasted to the list of surgical procedures. The manual was also deficient in the listing of pathologic and x-ray services.

One of our earliest efforts, as a committee, was to approach various specialty groups asking their cooperation. Sub-committees were appointed, representing each group. At times we had as many as 60 to 80 physicians working on this problem. Through cooperation of the internists, the allergists, the pediatricians, the psychiatrists, the neurologists and other groups involved in rendering pure medical service to the public, we created a separate section in the Relative Value Schedule referred to as Medical Services. At every point along the way we sought also the advice of the California Academy of General Practice.

In the second section, referred to as Surgery, we employed the same system of sub-committee work. We went through the Blue Shield-Blue Cross Actuarial Manual in detail. We reviewed each item, deleted those which were obsolete, and added new procedures which we thought current in surgical practice in the State of California. By a similar process, the sections on pathology and radiology were revised to their present form.

The end result of our work was a standardized nomenclature for medical services furnished by physicians in California. It was divided into four separate categories: Medical Services, Surgery, Pathology and Radiology.

Standardized Coding System

The second need we recognized was for a standardized coding system to meet needs of actuaries, statisticians and all others who work with fee schedules and who have reason to compare one schedule with another. We used the system created by the Blue Cross-Blue Shield Actuarial Manual as a pattern. Wherever a listed procedure had been retained, we used the code number used by the manual. Wherever an altered, or added, procedure had been included, we gave it a number conforming to the basic pattern. We now have a specific code number, in a four digit system, for each individual service listed in the Relative Value Schedule.

Relative Value Scale

Our third basic problem was to create a relative value scale rather than a fee schedule based on dollar value.

Here, perhaps, is the most fundamental contribution made by this committee. It is perfectly self evident, to members of this audience, that wide divergence of dollar values must exist in any fee schedule for medical services. There are fundamental differences between service type plans and indemnity plans. There should be differences in dollar values for medical services to various income groups. The cost of operating a doctor's office in an urban community, such as Los Angeles, is different from that of an office for rendering exactly the same type of medical service in a small mountain community, where the cost of living and overhead is much less. We recognize geographic variation in fees and we recognize variation for economic reasons also.

There is another source of irritation. It has been common practice to offer an insurance contract to the public as a $500 schedule or $300 schedule. In such a plan the price tag would be applied to a surgical procedure which was so uncommon and so rarely done that it would have no significance to the operator of that particular plan. In that same schedule of reimbursements, however, the dollar values assigned to the 30 or 40 most common procedures would be so low that they would create irritation between patient and physician. Net result was growing irritation and mistrust between the operator, the purchaser and the physician. These same inequities were present in some of the earlier Blue Shield schedules.

By process of evolution we decided that we should be able to assign to each service a value in units which would reflect the value of one medical service as compared with another.

Perhaps I have failed to make myself completely clear. As an example, if a simple follow-up office visit is worth $5, we should, by comparison and investigation, determine the relative value to be assigned for a complete history and physical examination. This second service obviously would be worth more in dollars than the first. If we were to give an office visit a relative value of 1 unit, the second service should be valued in excess of 1 unit.

This was a new theory. We could understand its propriety, but we found it impossible to arrive at any method of determining relative value on purely theoretical grounds.

Therefore, we had to approach the problem from the standpoint of actual practice. Again it was our decision, therefore, that we should initiate a survey to find out, in terms of dollars, what fees were being charged by physicians in California for medical services being rendered to the public. The initiation of a survey of this type in itself was a difficult project.

We ran test surveys in Orange County and in Sacramento County. Orange County was chosen because it has average distribution of rural communities and Sacramento County was chosen because it is more urban in type. We ran these pilot surveys mainly to test our methods and approach. By means of this pilot study, we were able to create a much more elaborate and statistically valid questionnaire, which was then sent to every practicing physician in the State of California.

Nearly 5,000 California physicians filled out the sheets

and returned them to us for study. Responses were punched on IBM cards, and then we attempted to discover what facts could be determined from the survey.

We ran these cards in many ways. We broke up the replies into various categories of physicians, according to their type and specialty practice. We ran the cards according to 10 different geographic areas chosen to reflect geographic distribution of physicians. We ran them through in any and every way suggested by our advisers and we were finally told that we had a source of information which would allow us to determine what dollar values were in use in practice of medicine in California at that time. Highest and lowest were discarded. Using only the middle 80 per cent of the replies, we determined what the median and mode figures should be for each service.

When this phase of our study was completed, we had a dollar value for each of some 200 medical services which would account for 90 to 95 per cent of payments to physicians under any existing insurance program of prepaid medical care.

Doctors are human beings. The law of supply and demand in the field of economics applies as well to services of physicians as it does to any other commodity or personal service. If a thousand doctors in a given community were accustomed to doing tonsillectomies, our survey would reflect a very proper median or modal figure in dollars for a tonsillectomy. If only two surgeons in that same community were capable of removing a brain tumor, the dollar value listed by the two would seem excessive by comparison.

To circumvent the law of supply and demand in such cases, the committee established a ceiling charge of $500. This was one step.

The second step was to hold meetings of large groups to which we invited sub-committee members representing the various branches of medical practice.

In these so-called knock head meetings, individual groups of physicians argued, sometimes violently, sometimes with equanimity, but at all times with honesty, I believe, to adjust the dollar values in our survey to a level which would be just and equitable to physician and patient alike.

Finally, these same committee members took the nomenclature which listed all of the services for medical care and, using our survey as a pattern, assigned a dollar value for each medical service.

When this monumental task was finished, the committee reviewed each individual item and each section. Whenever any criticism or controversy existed, we would call another meeting of the entire group to thrash out and adjust our schedule.

When this work of several years was completed, we had a listing of dollar values for each type of medical service being furnished by the practicing physician of California. It then became a simple mathematical problem to convert to a unit value. This was done.

Schedule Divided into Four Segments

Final task of the committee was to break the schedule into four separate segments: Medical Services, Surgical Services, Radiologic Procedures and Laboratory and Pathologic procedures.

High cost item in any prepaid medical plan is medical service. Very few, if any, of the existing plans at the time we started our work did anything other than list the fee for a home, office or hospital call. This did not take into consideration the problem of compensation where a complicated detailed medical evaluation must be done.

It did not take into consideration the fields of neuropsychiatry, allergy or pediatrics. Many of the earlier prepaid medical plans did not include medical services at all; they furnished nothing but surgical coverage with a minimum amount of coverage for laboratory and x-ray study. As these plans expanded and as these services were offered to the public on an insurance program, it became necessary to reflect the proper type of medical care in a fee schedule.

When you start to change the dollar value of a medical fee schedule in terms of percentage you may unbalance the plan. If you cut the value of medical services by 25 per cent and apply the same factor to surgical services, you might possibly be cutting the price for medical services too far. The same 25 per cent reduction in a surgical fee might create no economic problem. The percentage change produced by removing one dollar from a follow-up office visit might, in some instances, create as much as $100 change in a surgical fee.

The same type of reasoning can be applied to percentage variations in the dollar values to be assigned for payment under laboratory and pathology or x-ray where the cost of overhead and the cost of operation is tremendously high, as compared to the other two general groups, medicine and surgery.

With respect to the surgical section, we feel that any listing of relative values to include the services of the anaesthetist or the assistant should be tied strictly to the surgical section, as an integral part of that section and never separated from it.

Finally, we recommend strongly that the separate section of pathology and the separate section on radiology be maintained also.

Continuing Study Conducted

The Committee on Fees of the California Medical Association does not presume to believe for one moment that we have solved the problem of fee schedules for all time. We do believe that we have made a significant contribution. We are conducting a continuing study of the problem and we realize that it will be necessary, from time to time, to analyze our work critically and adjust it according to the experience of those who utilize it. We are currently in the process of preparing our first major revision, to include the Relative Value listing for anesthetic services and to correct some of the criticisms which our committee has received from insurance carriers and physicians since date of original publication in February 1956.

The work of our committee has aroused an astonishing amount of interest. We have distributed in excess of 15,000 copies of the Relative Value Schedule at this time and many additional copies have been printed from those copies distributed.

Many insurance companies have adopted it as the format for indemnity plans now for sale in the State of California. Several county medical societies have also been utilizing the Relative Value Schedule freely in their negotiations and with success.

Relative Value Schedule Used in Medicare Program

The Department of Defense used the Relative Value Schedule as the pattern for the expansion of the Medicare Program. A very curious, and to me a rather unhappy circumstance, arose in the Medicare Program, however. The Department of Defense adopted the format and coding system of the Relative Value Schedule. They then published a survey pamphlet listing a group of medical services and a code number for each one of them, but left the Relative Value figures off. They submitted these survey pamphlets to each of the 48 states and 3 separate territories of the United States.

Fifty-one committees of practicing physicians were hastily assembled to assign a dollar value to each one of the procedures listed in the survey. As a consequence, you readily see, they received 51 separate committee reports and there was no correlation between any of them. After this was done, the rest of the negotiations between the State Committees and the Federal Government were conducted on a dollar factor to be applied to the Relative Values established as proper by the California Medical Association survey.

This was not a unilateral action on the part of the Department of Defense. There was sincere fear on the part of many state medical associations that the dependents' medical care program would immediately establish a national fee schedule. The wide variation in the dollar amounts in the existing Medicare fee schedules attest to the fact that no national schedule has been established.

As a consequence, we have a very large number of fee schedules listed in terms of dollars. They vary so widely that it is difficult, if not impossible, to compare one with another. I think if all negotiations had been conducted on the basis of a dollar factor, and the relative values had been preserved, less administrative confusion would exist. Perhaps the present situation more properly reflects the manner in which medicine is practiced throughout the nation and, therefore, should be continued. Time, progress and experience will decide.

Conclusion

We accept the fact that it is impossible to create a perfect document in this field. There never has been and never will be a schedule of fees for medical services completely acceptable to all parties concerned. We think we have produced a very adequate working compromise in the Relative Value theory and in the Relative Value Schedule. Only through the advice of those of you who use it, can we determine, in fact, whether the theory is workable, sound and proper. Only through your advice can we discover our errors and correct them.

Getting the Most Out of Your Committees

MR. J. ALAN OFNER
Associate, McKinsey & Company, Inc.
Management Consultants
San Francisco, California

Committees play an ever-present role in today's society. They are part of a formal and informal structure, superimposed on the organization of most industrial enterprises. They play a role in the Congress of the United States or in your own local community government. They are part of lay church activity.

Often committees identify the corps of hard-working in-group members of an organized social group. Voluntary community organizations turn to committees for guidance, sometimes to supplement the activities of their paid staff representatives. Professional organizations have committees for technical guidance and advice. Because of the ever-present role of committees in today's society, hardly any of us escapes committee membership.

Committees take time, and time is certainly a precious commodity. Most of us have difficulty finding enough time for our various interests, concerns, and responsibilities. No wonder key executives frequently complain, "There just aren't enough hours in the day." For them there are not.

People are scarce too—particularly people who can assume responsibility and authority, who can manage well, or who have a high degree of skill.

One executive complained to me a short time ago that his company encourages a daily hour-long meeting of key people. Although they occasionally consider a serious matter during this hour, it has turned into something of a Kaffeeklatsch, a time to discuss golf games, or similar activities. The executive complains that this hour is lost from his workday and is a serious misuse of his own time.

Another man I know who is on the board of a voluntary community organization told me that the organization's board meetings, although infrequent, often last as late as 2 a.m. This man is an active professional person whose regular practice requires odd and long hours. He resents this additional intrusion into his time.

Such men want to make the best use of their time and efforts. They look for ways to make group action—as represented in committee meetings—more meaningful, for they feel that committees, as they are now generally established, do not represent the best way of using their own skills and experience.

Much of the literature on committees is keyed to techniques for better handling of committee meetings. In fact, research efforts thus far appear to have been devoted primarily to the consideration of interrelationships of individuals in group action circumstances. Many research groups in universities have devoted their attention to these subjects, as have such other activities as the Human Relations and Morale Branch of the Office of Naval Research. Here we will only briefly discuss techniques for better handling of committees. This is because we feel that if you are to get the most out of your committees, you should devote your attention first to determining when—not how—to use committees. Then you should establish guidelines for their effective use. To understand when to use committees one must appre-

ciate the pitfalls as well as the advantages associated with committees. We intend to describe these pitfalls and advantages and to discuss situations in which committees are most and least useful, and conclude with some guidelines for the effective use of committees.

When To Use Committees

Some committees are successful, some are not. Why? Understanding committee advantages and disadvantages provides the answer.

Here are some pitfalls and disadvantages associated with committees:

1. *Committees are time-consuming and burdensome.*

Many executives complain that committees compel them to divert precious time from more pressing responsibilities. They say that they are required to attend committee meetings to discuss rather routine matters. Too often, they say, the matters discussed are not pertinent to their participation or are not serious enough to require their presence, and to be adequately informed they must wade through volumes of material before and after the meetings.

A recent analysis of executive committee assignments in one organization showed that the total number of hours spent in committee meetings equalled approximately the full time of three executives. At least five key executives spent over 26 hours per month (exclusive of preparation time) in committee meetings. Officers of other organizations have reported participation in committee meetings to be so burdensome as to require half their time each month.

2. *Committees make decisions more slowly and no better.*

"That's it," he thought. "That's Freesmith's first principle of human behavior: one person can make a decision faster than a group. That's exactly, perfectly, precisely, absolutely it." This is a comment made by one of the characters in Eugene Burdick's novel, The Ninth Wave. And it emphasizes exactly, perfectly, precisely, and absolutely the general opinion of a prime disadvantage of committees. To many executives, committee meetings represent hours of bickering, "i" dotting, "t" crossing, discussion of minor facts, review of nonpertinent data and information, or simply, diversion to lighter considerations.

If decisions are slower, are they not better? Proponents of group decision-making claim that the decisions are better, and that the time is therefore well invested. Some executives point to important decisions reached as a result of a brainstorming session during which a key idea was expressed. But these same executives agree that these ideas may have been expressed by any of a number of other means. Ralph J. Cordiner, President of General Electric, said this about committees at a leadership conference in 1954:

> There is an important difference betwen a team and a committee. On a committee, everyone feels like an expert on everything, and no one has responsibility for anything. On a team, every man has a specific job to do, in relation to the whole. He knows what it is, and he carries out his responsibilities with due respect for the objectives of the organization as a whole.
>
> To put it another way, great discoveries and great decisions are made by individuals, not by committees.
>
> If you can name for me one great discovery or decision that was made by a committee, I will still find you the one man in that committee who had the lonely insight—while he was shaving, or on his way to work, or maybe while the rest of the committee was chattering away—the lonely insight which solved the problem and was the basis for decision.

Here is another example of opinion from a key business executive. Mr. C. F. Kettering, during World War I, began a search for a knock-free airplane gasoline. It was concluded that gasoline obtained from a particular California crude oil appeared much freer from knock.

> Ket suggested that the California gasoline be used for planes in combat, but a committee rejected his idea. Said Ket later: "If you want to iron a thing down to mediocrity, get a committee to pick flaws in it. Why? Because only one man in a thousand has imagination."

A later comment made by Mr. Kettering further indicates his feelings about committees. When Mrs. Kettering read about Lindbergh's solo flight across the Atlantic, she said to her husband: "How wonderful that he did it all alone!" "It would have been still more wonderful," he replied, "if he had done it with a committee."

Committees are too frequently remote from the problem under consideration to make a valid or accurate decision. Because of incomplete staff work, the committee often does not have enough information available. In addition, the group atmosphere prevents individuals from exercising their best judgment and deepest thinking.

This is what William Whyte said about committees in his book, The Organization Man:

> HERE IS ONE ACTIVITY WHERE COMMITTEE "EXPERTISE" IS AN OBSTACLE. In a committee which must "produce" something, the members must feel a strong impulse toward consensus. But if that something is to be a map of the unknown, there can hardly be consensus on anything except the most obvious. Something really bold and imaginative is by its nature divisive, and the bigger the committee, the more people are likely to be offended.
>
> At this vital moment, the moral responsibility one feels to his colleagues becomes a downright hindrance. A committee member might be inclined to support an idea, but he is also not inclined to put up the fight for it that will be needed. He is constrained by good will. He feels an obligation to his fellow committeemen, who are, after all, only trying to do a good job, like himself. So he compromises, not from mere timidity but from a real desire to show respect for the opinion of others. Even if he has trouble mustering up the respect in some cases, his good will may make him feign it. He has immediate social as well as professional considerations to think of, and throughout any meeting there runs a tacit dialogue that often has very little to do with the ideas being discussed.

Committee meetings take time. Decisions made in committees are slower and no better (possibly poorer) than if made by an individual.

3. *Committees circumvent normal authority relationships.*

This is particularly true in organizations which believe in placing real responsibility and authority in their key people. Here is a comment made by Ralph J. Cordiner regarding General Electric's program of decentralization.

"Its practical result is to put the responsibility for making business decisions not with a few top executives, but with the individual managerial and functional employees who have the most immediately applicable information required to make sound decisions and take prompt action. When such responsibility—along with commensurate authority and accountability—has been delegated according to a carefully planned organization of work, then each individual in the company has a challenging and dignified position which will bring out his full resources and enthusiastic cooperation."

In another pertinent comment, Mr. Cordiner said, "We are trying to avoid committees—committees that have an operating function to perform or decisions to make . . . we now have one committee, and it is advisory in name and fact; we feel that if we really are going to have decentralized authority, we must rely on individuals, not on committee decisions."

I recently observed committee activities in a large organization. I found that some individuals used the committee as a means to circumvent their superiors. Others used the committee to duck authority or responsibility. One group of executives, for example, brought to a daily committee meeting decisions which were appropriately theirs to make as individuals. This happened so often that the accustomed habit of these executives was to make few if any decisions themselves as individuals. The committee had circumvented the normal authority relationships.

Another by-product is the difficulty in holding individuals accountable for results and measuring individual performance.

4. *Development of people can be retarded.*

Making decisions in committees retards the development of people. Individuals develop best in an atmosphere that requires them to assume initiative and responsibility for making decisions. But in some committees decision-making responsibility is given to the group rather than to an individual. The individual then assumes only partial responsibility and shuns the initiative. This impedes his development.

Committees do play three important roles: as a training technique in developing people; as a form of communications; or as an atmosphere for problem solving. But communications do not develop people. Rather, they assist in personal development. Committees actually deter development when decisions are made by the group rather than by the individual himself.

To summarize quickly, we have said that associated with committees are certain pitfalls and disadvantages:

1. Committees are time-consuming and burdensome.
2. Decisions are slower and no better if made in committees.
3. Committees circumvent normal authority relationships.
4. Committees can retard development of people.

Advantages of Committees

Committees do play a most useful role in organizations today.

1. *Advisory committees can be useful.* Perhaps the most frequent use of committee action is that related to consultation and advice. Consultative management reached its most impressive form in a system of advisory committees generally called *multiple management.* Under this kind of program the key top executives typically form an advisory committee to the highest level of management. Each of these executives in turn is a chairman of a committee at the next lowest level of management. And so forth, through the various levels of management. This procedure spreads information quickly to all parts of the organization. Those who favor this technique say it brings problems to the attention of the responsible individual, along with the facts, experience and knowledge that can provide the best solution at the lowest practicable level.

D. W. Blend, vice president of Calumet Hecla, Inc., and general manager of the Wolverine Tube Division, described his company's multiple management plan in an article called Point of Decision in *Dunn's Review,* July 1956. Here are a few comments from that article:

> Multiple management committees are not joint discussion groups that manage by a show of hands. The chairman makes the final decisions—decisions are his responsibility. When the group discusses their problem, every member is given an opportunity to express his opinion . . . Each opinion is given consideration by the chairman in reaching the final conclusion, but the chairman is the man who approves the group's conclusions or makes the decision. This is of primary importance in the function of the advisory committees at Wolverine Tube.
>
> In these advisory committee meetings policies are formed, plans are developed and objectives established to implement the over-all program of the division. In all cases it is necessary to evolve ideas and find solutions to problems. The amount of information that flows in and through the sessions is amazing.

Consultative management or advisory committees are best used when one wants to tap the resources that exist across departmental lines to explore proposals and ideas and to have the advantage of diversified thinking. But consultative management should not replace the normal expected responsibility and authority, both for making decisions and for advising, which lie in individual key positions in any organization.

Committees are useful, then, when various organizational viewpoints must be represented and when the problems considered require diversity of background not found in an individual.

2. *Committees can aid communication.* Committees provide a vehicle for effective dissemination of policy and information. This is an advantage of a committee, particularly where in addition to securing cooperation in the execution of a decision, it is important that the decision be considered fair and free from bias. Participation in a discussion of the decision leads to a greater acceptance and a fuller understanding of it. The face-to-face communication in committee action helps to convey more complete information—for example, information regarding the underlying reasons for a given action, policy, or procedure. Committees also form vehicles for upward communication in the organization.

3. *Committees can be helpful as an employee relations device.* Because they aid in communication and provide

a vehicle for employee participation, committees contribute to better employee relations. Salary, suggestions, and grievance committees, for example, assure employees that matters are given a broad and fair rather than arbitrary consideration. In a survey of the relative merits of individual and group action, the American Management Association found the most significant influence which can be exercised by committees effectively is in matters relating to jurisdictional questions. The effect of jurisdictional problems on employee relations is considerable. Committees form a vehicle for consideration of matters of concern, for "blowing off steam" and, as mentioned previously, for assuring employees that matters affecting them are given proper consideration.

Advantages and Disadvantages Summarized

We have explored the advantages and disadvantages of committees. There are certain pitfalls associated with committees—they are time-consuming and burdensome, decisions in committees are slower and no better, committees circumvent normal authority relationships and can retard development of people.

Committees have advantages, too. They are most useful for advice and consultation, for aiding communications, and for their influence on employee relations.

These attributes provide a means for deciding when to use committees. In general, avoid decision-making by committees; be certain you do not place before committees decisions which should be handled by individual executives; and use committees primarily as a means for guidance, problem solving, reviewing jurisdictional matters, communications, or when you need to bring about better employee relations.

Guidelines for Effective Use of Committees

There are certain guidelines you can use to help get the most out of your committees. We have observed that organizations which utilize guidelines such as these find they typically help their chief executives and key management personnel make the best use of their time, make decisions more quickly and effectively, and develop future management personnel. Essentially there are six key guidelines:

1. *Make certain you need the committee.* Keep in mind that committees can best provide a medium for communications, guidance, and problem solving and to aid in improving employee relations. They are least effective in situations where decision-making is required. Then view the committee's purpose and function and make certain that this does not overlap or conflict with responsibility and authority you have assigned elsewehre in your organization. Having established that there is no such conflict, be certain that the purpose of the committee can be carried out better by a group than by an individual. For example, if the purpose of the committee is communications, be certain that other means cannot be used more effectively. If you are convinced that a committee is needed, avoid establishing a new committee if one of your existing committees can serve the purpose in line with its other responsibilities.

2. *Fix committee functions and responsibilities.* One of the most consistently agreed upon principles of organization is that duties and responsibilities should be definitely fixed and commensurate authority granted to carry out each assigned activity. The fixing of committee functions and responsibilities is as important as the fixing of authority and responsibility of individual key officers in the organization. Tell the committee what it is supposed to do. Clearly define the responsibilities of the individual committee members. Define the relation of the committee to other segments of your organization. It helps to define these functions and responsibilities in writing.

3. *Clearly determine the membership of the committee.* Having established the need for the committee and fixed its duties, functions, and responsibilities, now be certain that the individuals you select for membership on the committee are those who can best contribute to the committee objectives. Avoid circumstances which may allow for committee domination. When subordinates and superiors are on the same committee, the subordinate usually is less effective as a committee member. Consider the personalities of the people you select for committee membership. Putting extremely dominant personalities on committees along with passive individuals makes for committee domination and usually results in a less effective committee.

Consider the size of the committee. Keep it small enough to allow for effective contribution. Here are some comments recording some of the findings of a study in 1947 by the Laboratory of Social Relations at Harvard University.

> There seems to be a crucial point at seven. Below seven, for the most part, each person in the group says at least something to each other person. In groups over seven the low participators tend to stop talking to each other and center their communications on the few top men. The tendencies toward centralization of communication seem to increase rather powerfully as size increases.

4. *Use proper techniques for effective committee meetings.* Once you are certain that you need a committee, have fixed its functions and responsibilities, and determined who will participate in it, then it is important to know how to make committee meetings effective. Techniques for effective committee meetings include:

(a) Clearly identify the purpose of each meeting (this includes an agenda).
(b) Select an appropriate time and place for the meeting.
(c) Train the committee chairman in the techniques of discussion and leadership.
(d) Train committee members in techniques and purposes of proper participation and followership.
(e) Maintain the committee meeting schedule.
(f) Properly conclude all committee meetings.
(g) Provide for committee meeting follow-up.

5. *Establish committee controls.* If you have carefully identified the functions and responsibilities of the committee and have estimated properly the amount of time which will be required for committee participation, then you can establish controls which will tell you whether or not the committee is meeting these objectives and time requirements. For example, committee minutes will tell you the hours that a committee has met. If this committee is meeting too frequently, it may be discussing mat-

ters not within its purview or wasting time, or the subject it is assigned may be more complex than you thought it to be. If the committee is not meeting frequently enough, it may not be providing for a sufficient consideration of the subject. A simple time control will enable you to check this with the committee chairman. A quick review of committee conclusions and subjects for consideration against the carefully identified functions and responsibilities will tell you whether or not this committee is meeting its objectives.

6. *Appraise committee performance.* Having established the duties and responsibilities of the committee and proper controls over its actions, you are in a position to appraise the performance of the committee. Here are some things you may consider in such an appraisal. Ask yourself if the purpose and functions of the committee are clearly defined. Review again the committee's responsibilities to be certain that there is not some individual who could assume these responsibilities more effectively. Review at least annually your other committees to be sure that an existing committee might not assume the responsibilities for the committee you are appraising. Ask if two committees can be combined. Review the costs of the committee. The most obvious of these are the costs pertaining to the meeting time of the various committee members. Have the responsibilities of any of the committee members changed? Should new people, therefore, be appointed to the committee? Be sure that the committee has not outlived its original purpose.

Having considered the above matters, review specifically what the committee has accomplished during the past year. Obviously, unless the committee is serving a useful purpose, it should not be continued. As part of this review, be particularly aware of the possibility that minor problems are being referred to a committee of executives. Can these problems be handled on a lower level of your organization?

To repeat, there are six important guidelines which will enable you to get the most out of your committee:

1. Make certain you need the committee.
2. Fix committee functions and responsibilities.
3. Clearly determine membership of the committee.
4. Use proper techniques for effective committee meetings.
5. Establish committee controls.
6. Appraise committee performance.

Conclusion

To get the most out of your committees, use them primarily as a medium for communications, guidance, problem solving, and to aid in improving employee relations. Avoid using committees as a vehicle for making decisions, particularly when decisions are the responsibility of an individual. Devote attention to determine whether or not you really need the committee, just as you do when you decide if an individual job is really needed. Committees can be even more costly.

Then, fix the committee's responsibilities, decide with care who should be a member of it, provide training in techniques for effective participation, establish controls and appraise its performance.

Radio-TV Report Available from AMA

Medical societies interested in developing worth-while local radio and television programs may secure copies of the summary of the current radio-TV conference sponsored by AMA and the National Association of Radio and Television Broadcasters from AMA's Public Relations Department. The report contains basic information and helpful hints on using local radio and television in the health field. Representatives of state and county medical societies, allied health and welfare organizations and radio and television stations attended the two-day Chicago meeting. Requests for the summary should be addressed to Public Relations Department, American Medical Association, 535 North Dearborn, Chicago 10, Illinois.

SEARLE *announces...*

a superior psychochemical
for the management of both
minor and major
emotional disturbances

Dartal

T.M.

dihydrochloride

brand of thiopropazate dihydrochloride

- more effective than most potent tranquilizers
- as well tolerated as the milder agents
- consistent in effects as few tranquilizers are

Dartal is a unique development of Searle Research, proved under everyday conditions of office practice

It is a single chemical substance, thoroughly tested and found particularly suited in the management of a wide range of conditions including psychotic, psychoneurotic and psychosomatic disturbances.

Dartal is useful whenever the physician wants to ameliorate psychic agitation, whether it is basic or secondary to a systemic condition.

In extensive clinical trial Dartal caused no dangerous toxic reactions. Drowsiness and dizziness were the principal side effects reported by non-psychotic patients, but in almost all instances these were mild and caused no problem.

Specifically, the usefulness of Dartal has been established in psychoneuroses with emotional hyperactivity, in diseases with strong psychic overtones such as ulcerative colitis, peptic ulcer and in certain frank and senile psychoses.

Usual Dosage • In psychoneuroses with anxiety and tension states *one 5 mg. tablet t.i.d.*

• In psychotic conditions *one 10 mg. tablet t.i.d.*

A new record in the making...

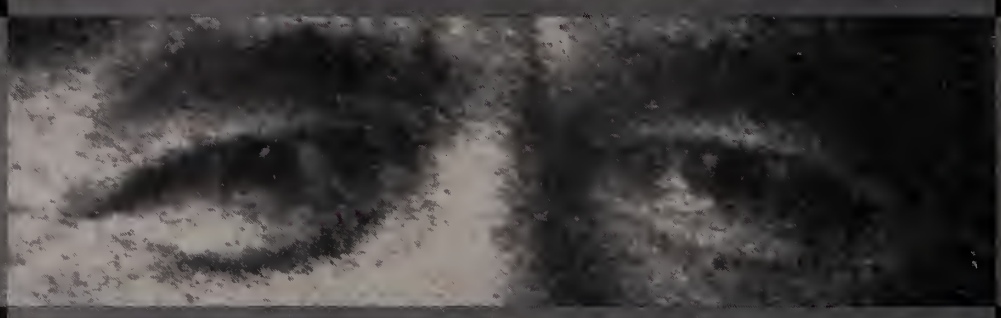
Outstanding benefits in therapy established ACHROMYCIN Tetracycline in the treatment of more than 50 different infections.

Now, new, rapid-acting ACHROMYCIN V Capsules offer more patients consistently high blood levels with the same broad anti-infective spectrum of the pure unaltered crystalline tetracycline HCl molecule of ACHROMYCIN, same low

Tetracycline HCl Buffered with Citric Acid

incidence of side effects, same dosage and indications. New ACHROMYCIN V Capsules do not contain sodium.

REMEMBER THE V WHEN SPECIFYING ACHROMYCIN V



CAPSULES: (blue-yellow) 250 mg. tetracycline HCl (buffered with citric acid, 250 mg.); 100 mg. tetracycline HCl (buffered with citric acid, 100 mg.). **ACHROMYCIN V DOSAGE.** Recommended basic oral dosage is 6-7 mg. per lb. body weight per day. In acute, severe infections often encountered in infants and children, the dose should be 12 mg. per lb. body weight per day. Dosage in the average adult should be 1 Gm. divided into four 250 mg. doses.

"Doctors can't help shingles?"

Physicians who have used PROTAMIDE extensively deplore such statements as unfortunate when they appear in the lay press. They have repeatedly observed in their practice quick relief of pain, even in severe cases, shortened duration of lesions, and greatly lowered incidence of postherpetic neuralgia when PROTAMIDE was started promptly. A folio of reprints is available. These papers report on zoster in the elderly—the severely painful cases—patients with extensive lesions. PROTAMIDE users know "shingles" *can* be helped.

Judge Oppenheimer Discusses Medical-Legal Film At Joint Medical Society-Bar Association Meeting

On October 15, 1957, more than 500 members of the Multnomah County Medical Society and the Multnomah Bar Association attended a joint meeting to view a medical film and the medical-legal film, "The Medical Witness," produced by the American Medical Association. Following are some of the comments on "The Medical Witness" presented to the group by Judge Eugene K. Oppenheimer, B.A., LLB, veteran judge of the Multnomah County Circuit Court.—Ed.

When first invited I hesitated to appear here for two reasons.

First, I questioned the propriety of a member of the judiciary engaging in a discussion such as the one at hand. Secondly, I did not want to appear as knowing all the answers. In short, I did not want to appear as a "wise guy" because I well know my limitations and the impossibility to make an accurate diagnosis and reach a sure cure.

JUDGE EUGENE K. OPPENHEIMER

To my mind the film we have just seen portraying the inefficient doctor witness is extreme, to say the least, in comparison with what actually happens in court. I am sure this was done purposely to make a point by comparison.

My remarks are not intended to be pro or con and will be limited in the main to "The Medical Witness." Comments as to the lawyers' part are for another day. What little I have to say will be of a "popcorn" nature—i.e., here and there without sustained continuity— and might well apply to any expert witness although pointed to the Medical Witness.

First let us deal in a few generalities.

Of course there should be a contact between the attorney and the witness. The witness should know what the question intends to elicit and the attorney should know what can be elicited from the witness. They should not be like the general in the Spanish-American War who said he had 10,000 men who had never seen a horse and 10,000 horses who had never seen a man.

Too often one observes conferences between the doctor and lawyer in the corridor outside the courtroom or the doctor will be there examining his records—all for the purpose of testifying immediately thereafter. This seems to be far too casual a preparation for a common understanding and the best results.

No one can instill the power of expression in a witness if he does not have that ability. However, conference and discussion can improve the manner of expression. Power of expression, as you all must know, has a telling effect on the listener. The learned may not be too fluent while the less learned may be more glib and effusive. The manner of speaking and the witness' postures in the witness chair have their place in effectiveness.

The narrator in this film remarked that the problem or question was the relation between the medical witness and the lawyer. This is true to a limited extent but the statement truly misses the *underlying* basis upon which a medical expert *should* testify. What is this underlying basis?

To me this basis is the relation of the doctor to the tenets of his profession—its high ideals and standards. I repeat—the doctor's respect for a noble profession by reason thereof appreciates the limits beyond which he must not go. If this basis is kept in mind, the problem of the medical witness as to substance as distinguished from procedure will be greatly lessened.

The medical profession encompasses a great science, involving long and continuous study and stands high on the pinnacle of respectability. The people want to look to it with confidence and guidance.

In a medical-legal aspect the doctor should not assume the role of an advocate. He should not take the offensive to put something over. *That is* the lawyer's job.

He should give his testimony in relation to his skill and knowledge and always in deference to his profession as one of science and with a high standard of ethics. His opinions should not be available to the money market like the weather vane to the wind.

It seems to me that there are three requisites to a formula that the expert should employ as a gauge:

1. One must get the facts of the case or situation;
2. One must form an honest judgment as to what those facts mean;
3. One must be able to fairly support his honest judgment by sound reason and medical logic.

(Continued on page 84)

(Continued from page 83)

The film just reviewed shows the lawyer at all times standing close to the witness. This encourages the witness to talk to the lawyer and vice versa with the probability that the best effect of the testimony is lost to the jury.

The picture also shows that x-rays were discussed for positive findings without a shadow box. Without a shadow box I doubt if a jury can gain any benefit from x-rays.

Here is one point that often causes objection by opposing counsel and evokes discussion. Different words with different people may mean the same thing—but this may not satisfy a legal standard. The law only recognizes a reasonable probability, not a possibility. Within the terms of possibility are such expressions as *might be* or *might or could be.*

I appreciate that medicine is not an exact science. However, when a question is put which calls for so-called medical opinion, the witness must first state whether he has or can express such an opinion in the light of the question. If he answers in the affirmative, then his answer must be within the range of *reasonable* probability—I repeat, not possibility. This difference should be kept in mind by the witness and his answers should be made accordingly.

I must remind the doctors that upon direct examination the lawyer cannot ask leading questions. In brief this means a question so phrased that it suggests an answer. However, this can be done on cross examination.

Many times a question will be put to a doctor as to whether the injuries in question were caused by the accident. For example, did the fall cause the injuries? This is objectionable because the *cause* of the injuries is a question of fact for the jury. However, the doctor can state that from a medical standpoint there is in his opinion a causal connection between the injuries found by him and the accident.

The *cause* of the injuries is for the jury to decide. However, that such injuries could with reasonable probability from a medical standpoint bear a *causal* connection with the accident can be shown by the medical witness.

The question at times arises as to when the history of an injured party may be repeated by the doctor. The rule is that the *treating or attending* physician may repeat what the patient said in regard to his or her injuries. This excludes the cause of the accident as stated by the patient—e.g., a drunken driver ran into me.

A physician who examines a party merely to testify on his or her behalf as to injuries cannot give the history of the patient as to the claimed injuries. This legally would constitute a self-serving declaration—i.e., the statements could be made to boost or serve the interests of the individual such as false statements.

A doctor who examines on behalf of the party against whom a liability is asserted, generally in personal injury cases, may testify as to any statement the injured party may have made because this is treated legally, if adverse, as a declaration against his or her interest. This is permitted under the legal precept of what is known as a "declaration against interest."

Many times a doctor may believe that merely because the lawyer for the side that did not call him starts to cross examine him that the lawyer is bent on proving him inaccurate, not fully versed with the subject or to be exaggerating beyond the limits of the truth. Generally this is not so. Of course, it may be true, but if the doctor will remember the three point formula heretofore mentioned, difficulty will not be encountered.

The doctor is a scientific witness, he is not an *advocate.* He must let the chips fall where they may. He need not be acrimonious or argumentative or be fearful something is wrong merely because he is being cross examined. He has done his part if his answers comport to his honest opinions based upon his scientific knowledge.

When a doctor is called on behalf of the injured party, naturally the charges for his medical service is an issue. On such occasions the doctor is asked, what is the amount of the bill? At times doctors will answer that they really do not know as that is up to the office secretary. One can understand that the secretary makes the entries but who would know better than the doctor what his service is worth?

At times the amount of charges appear to be the result of litigation or to serve a purpose and not to have been made in the regular course of treatment. The amount of pay any expert is to receive is always subject to question as a bearing on the interest of the witness.

Where there is an important medical question to be based upon a hypothetical state of facts, it might be well for the attorney to make a written draft of the question and submit it to the doctor before trial. The question, of course, would have to be read during the trial and it could then be shown that it had previously been presented to the doctor. This gives the doctor a better opportunity to study the question, be better fortified and make his answers more impressive.

A very common question put to a doctor is whether or not in his opinion the injured party has a permanent injury. This gives the doctor a marked lee-way, and I guess the best one can say is let his conscience be his guide. Although, as first stated, his sense of responsibility to his profession and its ideals should be the propelling influence based on his knowledge and experience. It is my understanding that there can be a permanency without functional disability and a functional disability without evidence of marked objective findings. In any event, the opinion given should not be an offhand conclusion to serve a cause.

Many of the points I have mentioned should be developed to a greater extent but time does not allow. I thank you all for this pleasant and enjoyable opportunity.

Julian Johnson of Philadelphia Addresses Eugene Surgical Society

Featured speaker at the fourth annual clinical meeting of the Eugene Surgical Society was Julian Johnson, professor of surgery at the University of Pennsylvania Medical School in Philadelphia. The meeting was held November 11 in the auditorium at Sacred Heart Hospital with the evening session and dinner being held at the Eugene Hotel.

Dr. Johnson spoke on Present Status of Cardiac Surgery and Present Status of Surgery of Duodenal and Gastric Ulcers. Local physicians who also presented papers at the meeting were: Leonard Jacobson, Donald Brinton and John Kirk.

the aching muscles

the fever

Viral upper respiratory infection. . . . For this patient, your management will be twofold—prompt symptomatic relief plus the prevention and treatment of bacterial complications. PEN·VEE·*Cidin* backs your attack by broad, multiple action. It relieves aches and pains, and reduces fever. It counters depression and fatigue. It alleviates cough. It calms the emotional unrest. And it dependably combats bacterial invasion because it is the only preparation of its kind to contain penicillin V.

SUPPLIED: Capsules, bottles of 36. Each capsule contains 62.5 mg. (100,000 units) of penicillin V, 194 mg. of salicylamide, 6.25 mg. of promethazine hydrochloride, 130 mg. of phenacetin, and 3 mg. of mephentermine sulfate.

Lane County Organizes Bureau To Present Talks to Public Groups

Three months of planning which began in October has culminated in the organization of a Speakers Bureau by the Lane County Medical Society. Thirty-nine members of the Society are available to present discussions on various medcial topics to public groups.

According to T. F. Brinton, Lane County Public Relations Chairman, the first step in working out the project was to send questionnaires to all Lane County members and compile the names and subjects of the volunteer speakers. Next, a speech professor from the University of Oregon gave instructions in public speaking at a dinner meeting.' And finally, a brochure was prepared which outlined the objectives of the Bureau, listed the choice of subjects and also told how to obtain speakers. This brochure was sent to the local news media, all Lane County members and all service clubs in the area.

The purpose of the Bureau as set down in the brochure is "to present a well-rounded program of accurate, up-to-date and interesting information on health and medical subjects . . . The doctor feels that his responsibility to the community does not end with the daily care of the sick. Learning and teaching is a large part of his daily life. He is equipped to give people useful information for the preservation of health through the Speakers Bureau of the Lane County Medical Society."

Other county societies which are interested in knowing more about this project are invited to request forms and information from: T. F. Brinton, M.D., Room 245, Sacred Heart General Hospital, Eugene, Oregon.

Artificial Kidney Gift to St. Vincent

St. Vincent Hospital, Portland, recently was given an artificial kidney—the first available for public use in the Northwest. The machine was a gift to the hospital from the St. Vincent Hospital Guild.

A spokesman for the hospital staff said the artificial kidney will not be used in chronic cases of kidney disease, but where a patient's kidneys have been temporarily damaged through injury, shock or carbon tetrachloride poisoning. The staff physician also stated that Portland has about 60 cases of uremia each year, about half of which are fatal.

Postgraduate Program Held in Corvallis

An all-day postgraduate program on General Medical and Surgical Problems was held November 19 in Corvallis. Physicians from Linn, Lincoln and Benton counties attended the lecture series.

Guest speakers, who each presented two lectures, were: Richard H. Upjohn, general surgeon; Charles S. Campbell, internist, and George J. Schunk, pediatrician. All are Salem physicians.

Jesse Ray Named School Governor

Jesse L. Ray, Portland gynecologist and chief of the medical staff at Physicians and Surgeons Hospital, has been elected to the board of governors of Stanford University Medical School by the school's alumni association. Dr. Ray is a 1939 graduate of the Stanford Medical School.

John Hoffman To Head State Civil Defense Emergency Medical Service

John Hoffman of McMinnville, Yamhill County Civil Defense Medical Director, has been appointed chairman of a state civil defense emergency medical service. The announcement was made by Vern Miller, President of Oregon State Medical Society, at a recent meeting of the Yamhill County Medical Society.

Dr. Hoffman and five committee members will formulate plans for medical services during emergencies throughout the state.

The work of the chairman will necessitate visits to nearly every county where disaster plans will be established in all hospitals. In other counties, Dr. Hoffman will establish teaching programs which will include nurses' training in civil defense and operation of 200-bed emergency hospitals available in most areas.

Dr. Hoffman will serve as chairman of the committee for one year.

Chest Physicians Hear Report on Isoniazid

According to Edwin L. Kendig, Jr., of Richmond, Va., a national survey conducted by the U.S. Public Health Service has revealed that isoniazid slows or stops complications arising from tuberculosis in children. Dr. Kendig made his report November 8 at the University of Oregon Medical School during a meeting of the Pacific Northwest chapter of the American College of Chest Physicians and the Pacific Northwest Trudeau Society.

During his discussion, Dr. Kendig stated that 2750 children with TB are under observation in 33 pediatric centers in the U.S. and that isoniazid had prevented at least 80 per cent of the complications of childhood TB in this group.

Southwestern Oregon Medical Society Sponsors Symposium on Psychiatry

A symposium on psychiatry in general practice was held December 3 at the Coos Country Club, Coos Bay. The conference was sponsored by the Southwestern Oregon Medical Society and featured six speakers prominent in the field of psychiatry in the Northwest.

Guest speakers who appeared on the program were: James Shanklin, Portland; Minnie L. Watterman, M.So.W., Oregon State Health Department; John W. Evans, Portland; Edward M. Scott, Ph.D., clinical psychologist for the state health department; John H. Waterman, director of Section I, state health department; and George Saslow, professor and head of the department of psychiatry, University of Oregon Medical School.

Exhibit on Radiology Wins Award

At the recent anual session in Chicago of the Radiological Society of North America, a top award for basic research in radiology was given to two physicians from the radiology department of the University of Oregon Medical School.

An exhibit by Louis H. Frische and Charles T. Dotter received "magna cum laude" honors. It described their radiologic procedure for more precise localization of occlusions in coronary artery disease.

Lane County Medical Society Elects Officers at Business Meeting

Keith D. McMilan assumed the presidency of Lane County Medical Society during the annual business meeting December 3 at the Eugene Hotel. He succeeded Leonard D. Jacobson. More than 100 society members attended the meeting.

During election of officers for 1958, the following were named to top posts in the Society: Emerson E. Abbott, president-elect; William I. Holcomb, vice president; Virgil W. Samms, secretary; Donald E. Moore, treasurer; and John D. Bonzer, John E. Tysell and Robert W. Lloyd, council members for two-year terms. All are Eugene physicians.

At a recent meeting of the Society Council, Robin M. Overstreet presented an intensified program which is being initiated by the Eugene School District for medical follow-up on positive tuberculin reactors. The Society recommendations are: (1) Pupil to be checked is to be referred to his own physician; (2) all new reactors are to have a large 14 x 17 chest x-ray; (3) therapy of tuberculosis cases is to be determined by the physician.

Society member Duncan B. Marsh has been appointed medical advisor to the Lane County Chapter of the American Red Cross for the Sections on Nursing Services and First Aid.

Financial assistance has been voted by the Society for postgraduate courses on athletic injuries to be held at the University of Oregon. The Society is joining with the University Department of Physical Education and the University Medical School in sponsoring the course, which will be given under the direction of Donald B. Slocum June 20 and 21.

Dr. Slocum will act as advisor to a committee of three—George W. Teller, Leland W. Stauffer, William D. Swancutt—which has been appointed to advise local high schools on training room equipment and athletic injuries.

Loren C. Barlow served as chairman of the Diabetes Detection Drive which was held during November.

For active mothers-to-be

Ulvical® (Ulmer) assures these modern ladies-in-waiting of a generous amount of iron and calcium plus the recognized prenatal vitamins . . . in a small tablet . . . especially designed for rapid assimilation and easy tolleration.

For maximal utilization . . . timed release of these essentials is accomplished by special coatings controlled to dissolve at the pH of the stomach, duodenum and jejunum.

Important, too, calcium pyrophosphate contains larger amounts of elementary calcium which is quickly metabolized to increase plasma blood levels. Leg cramps are quickly relieved; small daily doses sustain this relief.

Each tablet contains:

Calcium Pyrophosphote (Ca 150 mg., P 120 mg.), 7½ gr.
Ferrous Sulfate USP (Fe 38 mg.) 3 gr. 3.8 M.D.R.
Vitamin A (Ester) 1500 USP Units ⅜ M.D.R.
Vitamin D (Irradiated Ergosterol) 200 USP Units ½ M.D.R.
Thiamine Mononitrate (B_1) 1 mg. 1 M.D.R.
Riboflavin (B_2) . . . . 2 mg. 2 M.D.R.
Ascorbic Acid (C) 16.66 mg. ½ M.D.R.
Vitamin E . . . . . 2.2 I.U.* (from d alpha tocopheryl acetate N.F.)

M. D. R. — Minimum Daily Requirement. *M.D.R. not established.
Dose: One or two tablets three times a day.

VERN W. MILLER, M.D.

President's Page

Last month this page carried the photographs of the members of your State Executive Committee for 1957-58. With this issue I would like to inaugurate a program of paying proper recognition to the many committee chairmen who formulate and guide the countless activities of the Society. It can truthfully be said that many Society policies are born in committee. The chairmen pictured on this page represent four very important committees.

W. W. Boum, M.D., Salem
Chairman 1957-58
Committee on Disability Insurance

Arch W. Diock, M.D., Portland
Chairman, 1957-58
Committee on Public Policy

The scope of their activities ranges from professional welfare dealing with our disability insurance program to our relations with the State Legislature and U.S. Congress as carried on by the Committee on Public Policy. The Committee on Public Policy also conducts extensive meetings and offers counsel to other organizations or agencies proposing to place bills in the legislature that would in some way affect the practice of medicine. The Committee also keeps Society members alert to legislative problems of the day. The Society's accomplishment in assuring proper medical care for the injured workman is exemplified in the outstanding work of the Committee on State Industrial Affairs. One of our many commitees that devotes its interest to medical science is the Advisory

Ivon M. Woolley, M.D., Portland
Chairman, 1957-58
Committee on State Industrial Affairs

H. H. Foskett, M.D., Portland
Chairman, 1957-58
Advisory Committee to the Oregon State Board of Health on Laboratory Standards

Committee to the Oregon State Board of Health on Laboratory Standards. Here the Legislature itself has called upon the services of your Society by establishing this committee as a legally constituted agent of the State of Oregon. In subsequent issues you will have an opportunity to meet more of the men throughout the State who are giving their time and talents to activities on behalf of medical organization and to the communities in which they live.

WASHINGTON STATE
MEDICAL ASSOCIATION
1309 Seventh Avenue
Seattle 1, Washington

ANNUAL MEETING
Spokane
September 14-17, 1958

President, Milo T. Harris, M.D., Spokane Secretary, F. A. Tucker, M.D., Seattle Executive Secretary, Mr. R. W. Neill, Seattle

CONFERENCE PLANNERS: Members of WSMA Public Relations Committee are shown above as they met recently to plan the 1958 Conference for County Medical Society Officers, which will be held in Seattle January 25. From left are: Arnold Herrmann, Tacoma; Frank Henry, Seattle; E. Harold Laws, Seattle, chairman; F. M. Graham, Bellingham, and C. D. Muller, Bremerton.

Conference for County Society Officers To Be Held January 25

Featuring eminent guest speakers and subject material of vital concern to the medical profession, the second biennial Conference for County Medical Society Officers and Public Relations Chairmen will be held in Seattle, Saturday, January 25, under sponsorship of Washington State Medical Association.

President Milo T. Harris, of Spokane, announced that principal speakers will be Raymond M. McKeown of Coos Bay, Oregon, member of the American Medical Association Board of Trustees; George M. Fister of Ogden, Utah, chairman of AMA Committee on Legislation and also member of AMA Board of Trustees, and Mr. Warren Whyte of Chicago, executive secretary of AMA Committee on Legislation.

Dr. Fister and Mr. Whyte will discuss legislation, with particular reference to H. R. 9467, the Forand bill, which is now before Congress and is one of the most dangerous pieces of medical legislation since the infamous Wagner Murray Dingell bills of 1941-1951. The bill proposes that the federal government, by expanding the social security system, pay the cost of hospital nursing home and surgical service for persons eligible for social security benefits.

Dr. McKeown will be featured as luncheon speaker. His topic will be: The Challenge to Prepaid Medicine.

Other subjects on the program will be state legislation, press-radio-television relationships, and the Medical Defense Fund. Time will be provided for questions and discussion throughout the program. In addition, a forum will be conducted for the discussion of problems relating to county medical society activities and liaison with the State Medical Association.

The conference, to be held in the Olympic Hotel, is for county medical society presidents, presidents-elect, secretaries, public relations chairmen and executive secretaries. It is being planned by WSMA Public Relations Committee, under the chairmanship of E. Harold Laws of Seattle.

The first such conference was held in January 1956, and those attending rated it highly successful in improving liaison between the county societies and the State Association, promoting better public relations and as a forum for the exchange of ideas.

American College of Surgeons To Meet January 17 in Seattle

A cordial invitation is extended to all fellows and associates of the American College of Surgeons to attend the Pacific Northwest regional meeting in Seattle January 17. It is hoped all members of the College will invite interested physicians to participate in the meeting.

Scientific program will be held in the Health Sciences Auditorium of the University of Washington School of Medicine. Evening session will be conducted at the Rainier Club with a no-host social hour followed by dinner. Featured dinner speakers will be the College representative and president-elect Dwight L. Wilbur of San Francisco and John Paul Stapp, Colonel USAF, MC. Col. Stapp will speak on Man in Space.

Three New Members Appointed To State Board of Health

Three new members were appointed recently to the Washington State Board of Health by Governor Albert D. Rosellini.

New members of the Board are Carl Hutchinson, Seattle surgeon; Leonard McNamara, Soap Lake physician, and Talbot Wilson, Seattle dentist. They replace two physicians, Raymond L. Zech, Seattle, and Lawrence C. Pence, Spokane, and a dentist, Frederick H. Francis, Seattle.

Remaining members of the board are Bernard Bucove, Olympia, state director of health, who by law is chairman and executive officer, and Mr. Robert O. Sylvester, Seattle, sanitary engineer. Mr. George Ormrod, Olympia, state registrar of vital statistics, continues as secretary to the board.

Seattle Eye Bank Requests Physicians' Help in Obtaining Donations

One of the first active eye banks in the Northwest has been established at Providence Hospital, Seattle. The purpose of the Eye Bank is to collect eyes from recently deceased persons and to distribute the donated eyes to those eye surgeons doing corneal transplant surgery. Any eye surgeon needing an eye for a corneal transplant may place his name on the Eye Bank's list of eye surgeons, and he will receive a donated eye in rotation with the other surgeons.

The need for donated eyes for corneal transplant surgery is great. There are a number of patients who have been waiting for as long as four months for a donated eye so that sight-restoring surgery can be performed.

Every physician can be most helpful in supporting the Eye Bank and obtaining donations of eyes by telling selected patients of the work of the Eye Bank and the need for eyes. The Eye Bank, in turn, feels that it has an important responsibility to the donating patient's physician in keeping him informed when one of his patients has donated his eyes.

It is hoped that each physician will cooperate with the Eye Bank by informing Providence Hospital of the impending death of a donator. The donated eyes should be removed within four hours after death. The eyes can be removed in a hospital, mortuary, or the home by one of the Eye Bank Committee.

If an individual wishes to donate his eyes, he must sign two copies of a pledge form supplied by the Eye Bank. One copy is retained by the patient, the patient's family, or his attorney. The second of the two forms is forwarded to the Eye Bank at Providence Hospital.

There are approximately 25,000 visually handicapped in this country who could have useful vision restored by corneal transplant if there were enough donated eyes.

Doctors Hospital in Seattle Purchased by New Non-Profit Organization

The Doctors Hospital in Seattle has been purchased from the King County Medical Service Corporation at a price in excess of one million dollars. New owner of the hospital is the Doctors Hospital Association, a recently incorporated non-profit, charitable organization. The purchase price will be paid over a period of approximately 40 years.

The seven Seattle physicians who compose the membership of the new Association have long been identified with both the Corporation and Doctors Hospital. The officers are: Edward C. Guyer, president; Wilbur Watson, vice-president; James Standard, secretary-treasurer. Trustees include Rodney B. Hearne, John Collins, Morris J. Dirstine and Frederick A. Tucker.

The King County Medical Service Corporation has been sole owner of the Doctors Hospital since the government relinquished any claim to the facility upon its completion in 1944. The hospital was built during World War II with a federal grant of $665,000 plus a substantial amount contributed by the Corporation to whom the grant had been awarded. Although a division of the Corporation since 1944, the Doctors Hospital has actually been operated separately by the Board of Trustees of the Hospital.

Dr. Guyer, president of the new organization, has indicated that there will be no change in the administration of the hospital.

King County Medical Society Elects

Quin B. DeMarsh, Seattle internist, was named president-elect of King County Medical Society during the group's December business meeting. Dean K. Crystal, Seattle surgeon, was advanced to the presidency succeeding Wendell C. Knudson. Duncan Robertson was named secretary-treasurer-elect and Hugh W. Jones was installed as secretary-treasurer succeeding John R. Hogness. Members elected the following trustees: James W. Haviland, Waldo O. Mills and Robert W. Simpson. All are Seattle physicians.

Yakima County Medical Society Elects Officers for Current Year

During the regular December business meeting of the Yakima County Medical Society, new officers for the current year were elected and the Guide for Cooperation between the medical profession nad news media, which previously had been adopted by WSMA House of Delegates at the September convention, was unanimously adopted.

Fred L. Burrows succeeds H. F. Brundage as president of the Society. Other new officers are: Patrick A. Lynch, president-elect; C. A. DeLateur, vice president, and Stanley R. Durham, secretary-treasurer. Those elected by the members to serve as trustees are: Edward J. Shearer, Richard R. Sackmann and Frank LeCocq, Jr. Paul W. Rider was named delegate and Robert S. Fisher was selected alternate delegate. All are Yakima physicians except Dr. Shearer who practices in Toppenish.

The Yakima Society is the first to report adoption of the Guide. Prior to approval of the Guide at the December meeting, the Society's Executive Committee met several times with Mr. Charles Massey, Editor-in-Chief of the Republic Publishing Company. Mr. Massey has stated that the Yakima newspaper has established a policy of making no mention of a malpractice suit until judgment has been rendered by the court.

County Commissioners Okay Lease of Selah Hospital to State

Commissioners of the six counties—Grant, Adams, Yakima, Franklin, Benton and Kittitas—that own Central Washington Tuberculosis Hospital in Selah agreed on November 22 to lease the facility to the State Department of Institutions for use as a school for mentally retarded children.

Terms of the lease provide that the state will pay $3500 monthly rent, to be applied on the final purchase price of $250,000, if the next Legislature decides to buy it. The lease runs from Jan. 1, 1957 to June 30, 1959, with the monthly lease rate being divided among the six counties.

NEW MULTIPLE FORMULA FOR "TOTAL EFFECT" NUTRITIONAL SUPPORT

GEVRAL®-T

HIGH POTENCY VITAMIN AND MINERAL SUPPLEMENT LEDERLE

CAPSULES

"Total effect" nutritional support with new GEVRAL T frequently produces a dramatic total response in the debilitated patient. A unique, *six-formula* supplement providing nutritional reinforcement for the entire system, GEVRAL T supplies in each high potency capsule—

ALL THE FAT-SOLUBLE VITAMINS including K

A COMPLETE, HIGH B-COMPLEX COMPONENT

A COMPLETE, HEMATINIC SUPPLEMENT including non-inhibitory intrinsic factor

AMINO ACID SUPPLEMENT, l-lysine

LIPOTROPIC FACTORS, CHOLINE AND INOSITOL

12 IMPORTANT MINERALS AND TRACE ELEMENTS

Your patients get even more nutritional support for their money with economical GEVRAL T*...supplied in an attractive, on-the-table jar.*

Each capsule contains:

Vitamin A	25,000 U.S.P. Units
Vitamin D	1,000 U.S.P. Units
Vitamin B_{12}	5 mcgm.
Thiamine Mononitrate (B_1)	10 mg.
Riboflavin (B_2)	10 mg.
Pyridoxine HCl (B_6)	2 mg.
Vitamin E (as tocopheryl acetates)	5 I. U.
Vitamin K (Menadione)	2 mg.
Ascorbic Acid (C)	150 mg.
Calcium Pantothenate	5 mg.
Niacinamide	100 mg.
Folic Acid	1 mg.
Calcium (as $CaHPO_4$)	107 mg.
Phosphorus (as $CaHPO_4$)	82 mg.
Iron (as $FeSO_4$)	15 mg.
Magnesium (as MgO)	6 mg.
Potassium (as K_2SO_4)	5 mg.
Iodine (as KI)	0.15 mg.
Boron (as $Na_2B_4O_7 \cdot 10H_2O$)	0.1 mg.
Copper (as CuO)	1 mg.
Manganese (as MnO_2)	1 mg.
Fluorine (as CaF_2)	0.1 mg.
Zinc (as ZnO)	1.5 mg.
Molybdenum (as $Na_2MoO_4 \cdot 2H_2O$)	0.2 mg.
Choline Bitartrate	25 mg.
Inositol	25 mg.
l-Lysine Monohydrochloride	25 mg.
Rutin	25 mg.
Purified Intrinsic Factor Concentrate	0.5 mg.

DOSAGE: 1 capsule daily for the treatment of vitamin and mineral deficiencies, or more as indicated.

SUPPLIED: Bottles of 100 capsules.

Locations

David C. Groenig, formerly of Caldwell, Idaho, has entered into association with R. T. Harsh of Spokane for the practice of obstetrics and gynecology. Dr. Groenig received his medical degree in 1950 from the University of Minnesota Medical School and took his internship in Denver. After serving for two years in the air force in Fairbanks, Alaska, Dr. Groenig took three years of specialized training in obstetrics and gynecology in Kentucky. He had practiced in Caldwell for the past two years.

Kenneth K. Sato and *Donald Rice* have opened offices in Pullman for general practice. Both physicians were graduated from the University of Nebraska College of Medicine in 1953. Dr. Sato served his internship at the Delaware Hospital in Wilmington, Delaware. He then entered the USAF in 1955 and was stationed for two years in the Far East A.F. Headquarters near Tokyo. Following his discharge in February 1957 until his move to Pullman, Dr. Sato was on a general rotating residency at the Lincoln General Hospital, Lincoln, Nebraska. Dr. Rice interned at Nebraska Methodist Hospital and entered the air force in 1954. He served at Bentwaters, England and at Erding, Germany.

William G. Baldwin has joined the staff of the Eye and Ear Hospital in Wenatchee after recently completing two years of specialized training in otolaryngology, maxillofacial surgery and bronchoesophagology at University Hospitals, State University of Iowa. Dr. Baldwin's wife, Alpha, has been associated with the eye department of the Hospital for several years. Both Dr. Baldwins received their medical degrees in 1947 from Creighton University School of Medicine.

Betty Adams and *Robert Stovall* have joined the student health service of Finch Memorial Hospital in Pullman. Dr. Adams was graduated from the University of Washington School of Medicine in 1956 and served her internship at Deaconess Hospital in Spokane. Last summer she practiced at Northern State Hospital, Sedro Woolley. Dr. Stovall received his medical degree from the University of Utah College of Medicine in 1952. He served his internship in the navy and after his release in 1954, he began his practice in Waterville.

Alfred Blalock Discusses Heart Surgery

Alfred Blalock, while in Seattle to deliver the annual Alfred A. Strauss Lecture November 13 at the University of Washington School of Medicine, gave his views on the role of cardiovascular surgery. Dr. Blalock is director of the Department of Surgery at Johns Hopkins University and originator of the "blue baby" operation.

Dr. Blalock stated that while surgery to treat coronary artery disease is very useful in many patients, it remains unproved as the final solution to coronary disease. He further said that the chief value of surgery in coronary disease is relief of pain. He believes that the greatest goal surgery could achieve would be in finding the way to transplant organs from one person to another.

Clark County Physicians Participate in Emergency Service

Because of the problem of finding a physician to cover emergency care for those people having no personal physician, an emergency physicians service has been set up in Vancouver. It was initiated primarily by the hospital staffs, as it had been the experience that sometimes four, five or six different physicians' telephone numbers would be called before finding one who was available.

In 1953, a panel system was introduced for voluntary participation of general practitioners and specialists who would like to serve on emergency call basis. This list is posted monthly at the two local hospitals and the county and isolation hospital.

Any patient arriving at a hospital as an emergency patient without a personal physician is assigned to the physician on emergency call for that 24 hour period. About 30 physicians out of the approximate total of 60 on Vancouver hospital staffs participate in this service. Therefore each physician is on 24 hour call once every 30 days.

According to Edward J. LaLonde, public relations committee chairman, the Clark County Medical Society feels that the best answer to physicians' care for emergencies is prior arrangements with personal physicians. However, the Society realizes that it is quite convenient for the hospitals to locate a physician for transients or tourists in need of medical care. If the patient is residing locally and is satisfied with the care received, quite commonly the result is a permanent patient-physician relationship.

Haagensen of New York Discusses Surgery for Breast Cancer

According to Cushman Haagensen, professor of clinical surgery at Columbia University, selection of patients who will benefit from operation is a vital part of planning the surgical attack of breast cancer. Dr. Haagensen spoke on surgery for breast cancer while in Seattle recently for a surgical demonstration on closed circuit TV at Harborview County Hospital.

Dr. Haagensen stated that in his own hospital in New York, not more than 50 per cent of women with breast cancer undergo surgery and that many are treated successfully with radiation. He emphasized that delay in seeking medical attention after discovery of symptoms of cancer is a major cause of death in breast cancer. The New York surgeon stated that women in the United States now wait an average of ten months, which is far too long.

Donald Thorp Heads Coast Society

Donald Thorp of Seattle was installed as president of the Pacific Coast Obstetrical and Gynecological Society at the group's recent annual meeting in Palm Springs. The Society's next annual meeting is slated for Seattle in October 1958.

U. W. Receives Grant From AEC

University of Washington School of Medicine has received a grant of $12,600 from the Atomic Energy Commission to help obtain specialized radiation equipment and teaching aids. This equipment will be used to stimulate study of radiology and uses of radioisotopes.

Seattle Surgeons Plan Annual Meeting

Herbert F. Mosely of Montreal, Quebec, will be guest speaker at the Annual Dinner and Clinic of the Seattle Surgical Society, which will be held in Seattle March 21 and 22, 1958. Main theme of the Clinics will be surgery of acute trauma.

Dr. Mosely is Hunterian Professor, Royal College of Surgeons of England and Assistant Professor of Surgery at McGill University Faculty of Medicine. He is widely known for his text books of surgery and orthopedics.

All members of the medical profession are invited to the Clinics and Dinner.

Series of Health Forums Being Presented in Vancouver

Much interest has been shown by Clark County residents in the four monthly health forums being presented under the sponsorship of Clark County Medical Society and *The Columbian* newspaper. The series of free public forums, first of its kind in Vancouver, began in November and will conclude in February.

Flu and its variations was discussed during the November meeting. The December session considered heart diseases. In January, the panelists will speak on surgery and anesthetics, and in February the topic will be cancer.

Members of the Society's public relations committee are in charge of program arrangements. They are: Edward LaLonde, committee chairman; M. R. Mongrain; Clyde Hutt and Robert Fitzgerald, Society president. A total of 16 of the county's approximately 70 physicians will participate in the forums.

Spokane County Health Officer Named

Ernest O. Ploeger, Jr., screening physician for the state department of public assistance, has been named Spokane county health officer to replace Arthur E. Lein who died last year. Dr. Ploeger took over his duties December 2. He was graduated from University of Oregon Medical School in 1953 and was a former staff physician at Edgecliff Sanatorium, Spokane.

Thrift Hanks Fills New Health Post

Thrift G. Hanks has been appointed to a new post of director of health and safety at the Boeing Airplane Co. headquarter offices in Seattle. Sherman W. Williamson, formerly assistant medical director, succeeds Dr. Hanks as Seattle-division medical director. Dr. Hanks has been with the firm since 1941, and Dr. Williamson since 1952.

Whitman County Medical Society

Thomas Carlisle, Seattle radiologist, was guest speaker at the November meeting of the Whitman County Medical Society in Pullman. Dr. Carlisle spoke on detection of cervical and uterine cancer in the doctor's office.

Whidbey Island Fetes Henry Carskadden

Henry Carskadden was honored recently for his 38 years of medical service to residents of Whidbey Island at a reception sponsored by the Oak Harbor Rotary Club. Dr. Carskadden retired from active practice early in December. He commented that he will now devote his time working to obtain a hospital for the Island.

New AMA Booklet Contains Medicolegal Assistance

What can a physician do to protect himself against a possible malpractice claim if a patient comes to him with what appears to be a fractured limb, but refuses x-ray examination or otherwise disregards the doctor's advice?

Suggestions regarding such a medicolegal problem and others are contained in a booklet which has been distributed to county medical societies by the Washington State Medical Association.

Entitled Medicolegal Forms with Legal Analysis, the booklet was prepared by the Law Department of the American Medical Association. The booklet contains text material, case citations and sample medicolegal forms to help physicians prevent unjust malpractice claims in their office and hospital practices. It is not intended, however, to substitute for individual legal counsel.

The material and forms in the booklet deal with such subjects as consent to operations, the patient's right to privacy, confidential communications, artificial insemination, autopsy, and the physician-patient relationship. Physicians and their attorneys may adapt the various authorization and consent forms to their own needs.

So that they may be available for reference, copies of the booklet have been sent to the medical libraries of King, Pierce and Spokane counties, and to the offices of executive secretaries or medical service bureaus in other counties.

Natural Childbirth Advocate Lectures in Seattle

Primary medical objection of Grantly Dick-Read, originator of the Read method of natural childbirth, to modern obstetrical methods which include routine interference in most births is the fact that the pain killers and induction methods "rob a woman of the most wonderful experience she can know."

Dr. Dick-Read, now retired after 45 years of practice in Great Britain, spoke in Seattle recently while on his second tour of the United States. His first tour was ten years ago. He remarked that he had found that natural childbirth had "spread amazingly" since his first visit.

The English physician has been advocating natural childbirth for 50 years and has written numerous books and articles on the subject.

While in Seattle, Dr. Dick-Read conducted two public lectures in the Health Sciences Auditorium of the University of Washington, and also spoke at a staff meeting at King County Hospital and at Virginia Mason Hospital. His visit was sponsored by the Association for Childbirth Education, a Seattle group for education of expectant mothers.

Kittitas Physicians Hear Talk on Heart

Kittitas County physicians met in the Ellensburg Golf and Country Club November 5 to hear Robert M. Levenson and J. C. Michel of Seattle discuss new information in the field of cardiology. The two Seattle physicians are members of the Washington State Heart Association's County Symposia Series Team. Subject of the session was Phantom Heart Disease.

Clark County Medical Society Elects Officers for 1958

Annual meeting of Clark County Medical Society was held at the Royal Oaks Country Club on Tuesday evening, December 3. Prior to the meeting a film, Edema In Congestive Heart Failure, was shown.

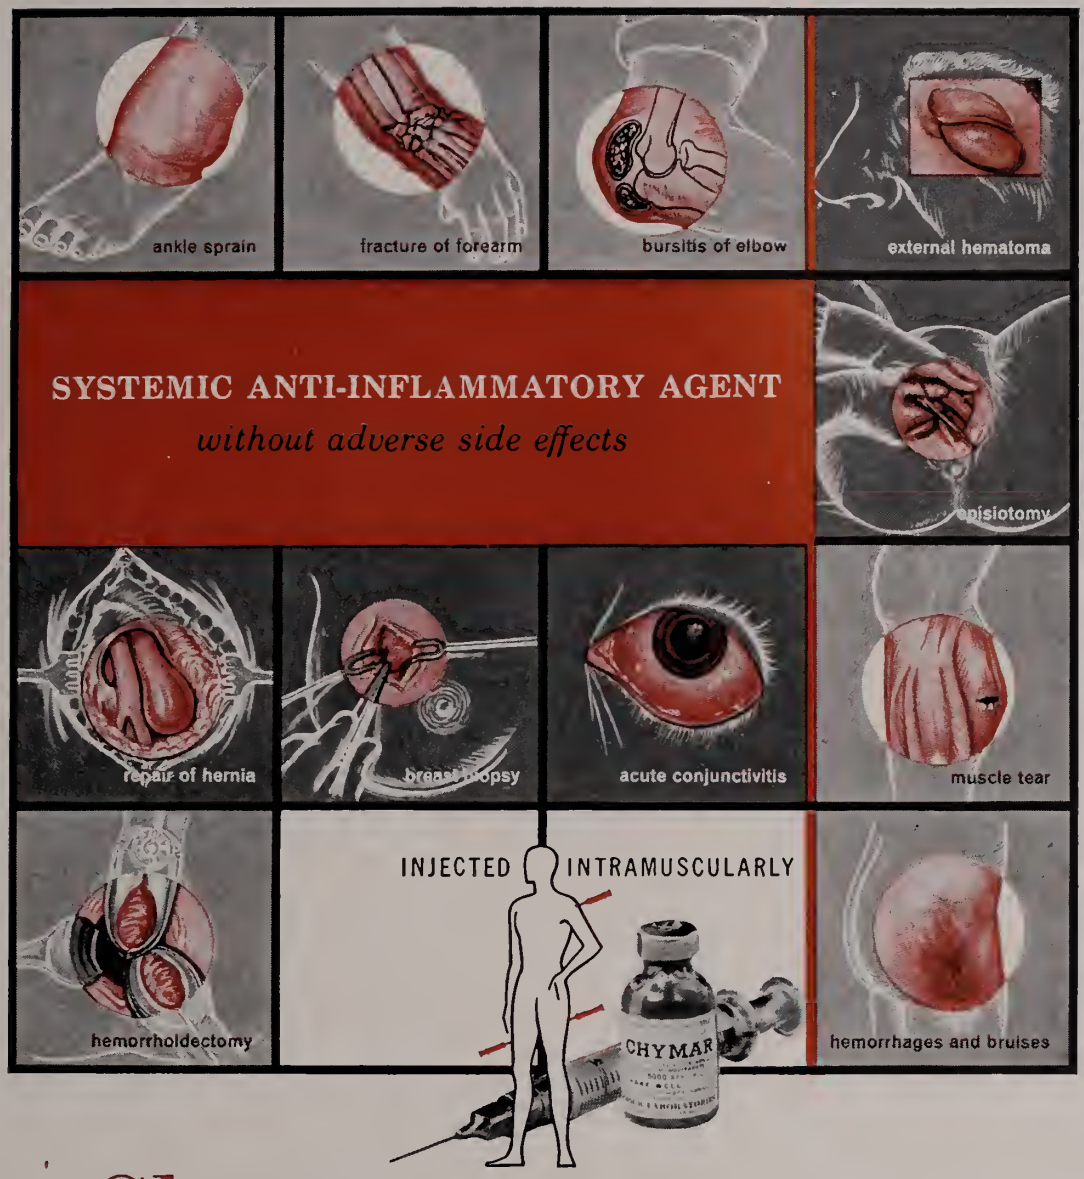
During the regular business meeting that followed dinner and social hour, the following members were elected to serve as officers for 1958: J. C. Brougher, President-Elect, Vancouver; T. E. Dillman, Treasurer, Vancouver; Emil Brooking, Secretary, Camas; H. L. Eldridge, Delegate, Washougal; I. C. Munger, Jr., Delegate, Vancouver; E. J. LaLonde, Alternate Delegate, Vancouver, and Dennis Seacat, Alternate Delegate, Vancouver.

Gerald W. Turley of Ridgefield, President-Elect, was installed as President for 1958 succeeding Robert E. Fitzgerald. Also during the business meeting, the following were elected to membership: Donald A. Champaign, Howard A. Haskins and Ted Casey.

Physicians Lead in Pledging Funds To Hospital Campaign in Puyallup

As reported on November 1, Puyallup Valley physicians had over-subscribed their goal of $50,000 to the Good Samaritan Hospital Campaign to raise $250,000 to enable the facility to move to more modern and more adequate headquarters. The report also showed that employees of the Good Samaritan and Lutheran Hospitals had also exceeded their quota.

The physicians' total pledge of $50,530 represented 101 per cent of their quota, and the employees' donations of $10,633.86 represented 126 per cent of their goal.



The fund drive has been undertaken to enable Good Samaritan Hospital to move into the building presently occupied by the Lutheran Hospital, thus making it possible for it to expand its services to the Valley's 30,000 residents. Both of the facilities are operated by the Lutheran Welfare Society.

A memorial gift of $20,000 has been given to the hospital fund drive by the widow of Warner M. Karshner, pioneer Puyallup Valley physician. It is planned to equip one surgery with the amount and provide a memorial plaque to Dr. Karshner. The pioneer physician was one of five doctors who originally banded together to provide a general hospital for Puyallup.

C. F. Hoffman of Woodland Honored

More than 200 persons gathered recently in the Woodland School for a testimonial dinner honoring C. J. Hoffmann and Mayor Earle Bryant, who had served the community for 50 years as physician and pharmacist, respectively.

Dr. Hoffman, who was graduated from the University of Oregon Medical School in 1907, moved to Woodland after practicing in LaCenter for one year. He was named the state's GP of the year in 1948 by Washington State Medical Association, and received his 50-year pin from the Association during the 1957 convention. Both Dr. Hoffman and Mayor Bryant were given plaques on behalf of the Chamber of Comerce.

Chymar®

CHYMAR, a suspension of chymotrypsin in oil, is preventive as well as therapeutic. **Reduces and Prevents** inflammation from any cause, traumatic and infectious edema, pain from inflammation and swelling . . . **Hastens** absorption of blood and lymph effusions . . . **Restores** circulation . . . **Promotes** healing . . . **Augments** action of antibiotics . . . Has no known contraindications or incompatibilities.

Dosage: Inject 0.5 cc. to 1.0 cc. of Chymar intramuscularly 1 to 3 times daily until clinical improvement is obtained. **Supplied** in 5 cc. vials. Each cc. contains 5000 units of proteolytic activity.

C. O. ARMSTRONG, M.D.

Death Takes C. O. Armstrong Former Northwest Medicine Trustee

Dr. Clifford Oakley Armstrong, 66, dean of the Moscow community's medical profession, died at 3 a.m. Monday (November 18, 1957) at Mesa, Arizona. With his wife, Maud, Dr. Armstrong had left Moscow early in October to spend the winter in the southwest. He became ill about midnight.

Born in Barneston, Nebraska, April 27, 1891, Dr. Armstrong came to Moscow in 1921 after receiving his doctor of medicine degree from the University of Illinois College of Medicine in 1919. He interned two years at Kings County Hospital, Brooklyn, New York, and came to Moscow to become associated with the late C. L. Gritman.

Active in medical and civic affairs, Dr. Armstrong retired from active practice in April following an illness early in 1957. At the time of his retirement, he was associated with John Ayers with offices in the Medical Professional Building. He had been associated with Dr. Gritman until 1933 and associated with Dr. Ayers in 1952. During that period he had served as contract physician for the University of Idaho, City of Moscow, Union Pacific and Northern Pacific Railroads and Washington Water Power Company.

His civic affiliations were numerous, including Rotary club as a past president; Elks lodge, as past exalted ruler; Masonic lodge and Eastern Star; Idaho Ad club; Episcopal church and numerous medical profession organizations. He was a member of the North Idaho district Medical Society; Idaho State Medical Association; American Medical Association; American College of Surgeons; Nu Sigma Nu (medical honorary) and was an associate member of the Spokane Surgical Society. He was a charter member of the board of directors of the Idaho Ad club.

Dr. Armstrong served organized medicine in a number of capacities. He was a member of the old Medical Examining Board from 1944 to 1949, and served as Chairman from 1947 to 1949; he was a member of the Medical Practice Act Committee; Armed Forces Advisory Committee; Trustee to NORTHWEST MEDICINE in 1951-52; a member of the Advisory Committee for Care of Indigents, 1953-54; and a member of the Advisory Committee for care of the Blind in 1954.

State Board of Medicine

A Temporary License was issued in November to Roosevelt Williams Kite, Sunnyside, Washington. Graduate of University of Kansas School of Medicine, 1933. Internship Providence Hospital, Pine Bluff, Arkansas, 1934. Granted TL-199, November 4. General. (Priest River or Newport, Washington.)

S. M. Poindexter, Boise, Chairman of the State Board of Medicine, attended a meeting of the Executive Committee, Federation of State Medical Boards in Philadelphia, during the AMA Interim Session in December.

The next regular meeting of the Board will be held in Boise, January 13-15, 1958.

Placard Issued on Exchange of Drugs

Idaho State Board of Pharmacy has sent every drugstore in the state a placard containing the following information:

NOTICE TO THE PUBLIC—
RETURN OR EXCHANGE OF DRUGS PROHIBITED

Drugs, medicines, sick room supplies, and items of personal hygiene shall not be accepted for return or exchange by any pharmacist or pharmacy after such drugs, medicines, sick room supplies or items of personal hygiene have been taken from the premises where sold, distributed or dispensed.

Former State Public Health Director Dies in Oakland, California

The many friends of Mr. L. J. Peterson were shocked to learn of his death on October 27 in the Providence Hospital, Oakland. "Pete" was 54 years of age and recently accepted a position with the Crippled Children's Bureau of the California Department of Public Health.

MR. L. J. PETERSON

"Pete" served public health and the residents of Idaho faithfully for more than 30 years in a number of capacities. Prior to moving to California, he had served as Administrator of the Idaho Elks Rehabilitation Center and was a guiding light in the construction of the new building which was dedicated in October.

He is survived by his widow and two children. Services were held in Boise on October 31.

"Pete" was a very good friend of medicine. He knew physicians in all sections of the state on a personal basis. He served an activity which he firmly believed to be good. He enjoyed the respect and admiration of thousands. He will be missed by all of us who knew him.

Meetings Held During November

On November 5, Quentin W. Mack, Boise, addressed the 15th Annual Meeting of the Idaho State Conference of Social Work on the subject of Disability Rehabilitation.

On November 7 Southeastern Idaho District Medical Society met with members of the Southeastern Idaho Bar Association in Pocatello to see the AMA American Bar Association film, The Medical Witness. Approximately 150 physicians and attorneys attended.

On November 9 the Association's Mediation and Public Relations Committee, chairmaned by Manley B. Shaw, met in Boise. Members who attended included E. V. Simison, Pocatello; Wallace Bond, Twin Falls; Robert S. McKean, Boise; Reuben C. Matson, Jerome; and Dauchy Migel of Idaho Falls.

On November 21 Southwestern Idaho District Medical Society had Otto C. Page, clinical instructor of medicine at University of Oregon School of Medicine, Portland, as speaker on the subject, Use of Oral Preparations in the Control of Diabetes. Approximately 50 attended. S. M. Poindexter, Boise, was named Chairman of the society's Nominating Committee.

W. L. Hubler Heads Diabetes Drive

W. L. Hubler of Caldwell conducted the community-wide diabetes detection campaign held during Diabetes Week, November 17-23. The campaign encouraged residents to go to their physicians to find out whether they were diabetics.

When oral tetracycline was administered to patients with various respiratory infections, including bronchial pneumonia, lobar pneumonia, acute and chronic bronchitis, asthmatic bronchitis, ". . . antibiotic effectiveness could be clearly demonstrated from somewhere between 64 per cent and 85 per cent of these cases. These figures include 10 cases of long-term therapy, in all of whom therapy was felt to be beneficial. . . . Evidence of toxicity, side reactions and allergic responses were gratifyingly milder and less frequent. . . ."[1]

Hugh B. Fate To Head ATMA for 1958

Information about Dr. Fate did not appear in the editorial section of the December issue because of unavoidable delay in receipt of copy.—Ed.

Hugh B. Fate is the choice of his 80 fellow members to direct the course of the youthful, growing Alaska Territorial Medical Association during the current challenging year. As a specialist in eye, ear, nose and throat disease, Dr. Fate is well acquainted with the middle ear disease and mastoiditis which is one of the greatest health problems now facing the physicians of Alaska.

After receiving his medical degree in 1935 from the College of Medical Evangelists, Loma Linda, California, he served his internship at Fresno County Hospital in California. Ten years following his graduation from medical school, he completed residency training in his specialty at a Detroit hospital. Another five years and Dr. Fate had added his name to the growing roster of physicians who found practice in the far north a stimulating experience. A ratio of one physician to approximately 2500 persons makes the Alaska physician's day a long one and his practice a demanding one.

In addition to a private practice in Fairbanks, Dr. Fate is E.E.N.T. consultant to the Alaska Department of Health, Alaska Native Health Service and Veterans Administration. To this crowded schedule he now adds the task of guiding his Association, a post well-earned by his keen interest and enthusiastic participation in organizational affairs.

IN LOW-BACK ACHE

STOP THE MUSCLE SPASM

Disipal®*

Brand of Orphenadrine HCl

Relieves Spasm, Pain, and Depression too

IN PARKINSONISM

Highly selective action...energizing against weakness, fatigue, adynamia and akinesia...potent against sialorrhea, diaphoresis, oculogyria and blepharospasm...lessens rigidity and tremor...alleviates depression...safe ...even in glaucoma.

Patients with muscle spasm of the usual types demand relief first. Disipal fills this need. In sprains, strains, fibrositis, noninflammatory arthritic states and other musculoskeletal disorders, Disipal not only relieves the spasm, but alleviates the depression which so often accompanies pain of any type.

Dosage: 1 tablet (50 mg.) t.i.d.

Riker LOS ANGELES

THE AMERICAN MEDICAL ASSOCIATION

In . . .  Philadelphia

Philadelphia, host to AMA Clinical Session last month, lived up to its Quaker heritage with dignified but friendly welcome to convention visitors. Contrast with New York, locale of the Annual Session six months previously, was striking.

The meeting was well attended although registration figures did not equal those of the Seattle meeting a year ago. Physician registration at Seattle was 2,813, at Philadelphia 2,637. Traffic snarling snow storm which started during the evening of the first day and continued through the second may have had something to do with the differences. By Wednesday afternoon, traditional day out of the office for Philadelphia physicians, good sense seemed to indicate home and fireside, rather than a trip to Convention Hall. Activities of the House of Delegates were not hampered.

Lectures, motion pictures, color television, scientific and technical exhibits were housed in Philadelphia's cavernous Convention Hall, so huge that only a portion was needed for the AMA show. Facilities and arrangement were more than adequate.

Planned for Regional Participation

Plan for the mid-year AMA meetings is basically that of regional participation. They are scheduled in widely separated areas in order to give many physicians, not otherwise familiar with AMA activities, an opportunity to attend an AMA meeting. Speakers and panel participants are chosen largely from the area of the meeting. Subjects discussed are those particularly pertinent to clinical medicine. The Philadelphia meeting followed the plan.

Lectures included several subjects in the field of psychiatry, a number on heart and circulation, a few on digestive diseases and nutrition, a number on cancer and several on pediatric subjects. Trauma, late effects of radiation, poisoning, arthritis, thyroid disease, antibiotic resistant staphylococci, and allergy were included in the wide range of practical subjects presented.

Films from Northwest Shown

Motion picture program was drawn from sources more widely spread. There were films from Paris, Mexico, Canada, Australia and England. The West Coast was represented by three films. One of these was on fluid balance. It was produced by Belding H. Scribner of Seattle and Carl R. Hines of Chicago. Harkins, Sauvage and Vetto of Seattle contributed a film on direct hernia. A film on cholecystectomy and operative cholangiography was sent by Joel Baker and John Walker of Seattle.

Transatlantic conference by telephone connection between Convention Hall and Barnes Hall, London, was scheduled for the afternoon of December 4. Participants in the discussion on chemotherapy of cancer, with special reference to leukemia, were Leandro Tocantins and R. P. Custer of Philadelphia, J. H. Buchenal of New York, Sidney Farber of Boston, Emil Frei, Bethesda and Howard Skippper of Birmingham, Alabama. London participants were A. Dickson Wright, Alexander Haddow, Ronald Bodley-Scott, Eve Wiltshaw and John Wilkinson.

The Sheraton Hotel Ballroom was utilized for showing of "M. D. International," a color film to be used in the television program March of Medicine, and for presentation of the Westminster Choir of Princeton, New Jersey. The film was sponsored by Smith, Kline and French Laboratories, producers of the television series. The Westminster Choir was presented by Winthrop Laboratories as part of the series which included the Boston Symphony Orchestra during the Boston meeting and the Seattle Symphony during the 1956 meeting.

Scientific exhibits, as always, were carefully selected

Announcing

ROMILAR CF

the new, complete Cold Formula

Romilar CF brings new comfort and ease to your patients with colds and other respiratory disorders by providing more complete symptomatic control. Romilar CF syrup combines the benefits of an antihistaminic, a decongestant, and an analgesic-antipyretic with the effective cough suppressant action of Romilar Hydrobromide* — the non-narcotic cough specific with codeine's antitussive effect but without codeine's side effects.

Each teaspoonful (5 cc) of Romilar CF provides:

Romilar ® Hydrobromide*	15 mg
Chlorpheniramine Maleate	1.25 mg
Phenylephrine Hydrochloride	5 mg
N-acetyl-p-aminophenol	120 mg

ROCHE LABORATORIES
Division of Hoffmann-La Roche Inc
Nutley, New Jersey

*Brand of dextromethorphan hydrobromide

YOUR PATIENT NEEDS AN ORGANOMERCURIAL

Practicing physicians know that many years of clinical and laboratory experience with any medication are the only real test of its efficacy and safety.

Among available, effective diuretics, the organomercurials have behind them over three decades of successful clinical use. Their clinical background and thousands of reports in the literature testify to the value of the organomercurial diuretics.

for interest and educational value. These, also, were contributed for the most part by those in the Philadelphia area. The Northwest was not represented. A special exhibit on history of medicine in Philadelphia was a feature of the exhibit.

House of Delegates sessions were of more interest than usual at an interim session due to discussion of several controversial subjects. Even before the House convened it became apparent that fluoridation of public water supplies would create the most discussion. It did so, on the floor as well as in reference committee.

Fluoridation Issue Re-examined

Re-examination of the fluoridation issue was ordered by the House at the Seattle meeting with directive that findings be reported at the Philadelphia session. Numerous hearings have been held during the year by a special committee with members from the Council on Drugs and the Council on Foods and Nutrition. The committee produced a 27 page report which was presented to the Board of Trustees and transmitted to the House without comment from the Board. Conclusions expressed in the report were that fluoridation of water supplies to a level of one part per million has been established as a method of reducing dental caries, that since the 1951 statement, no evidence has been found that ingestion of such water is harmful to the general health and that fluoridation of water supplies should be regarded as a prophylactic measure for reducing tooth decay and is applicable where the water supply contains less than the equivalent of 1 part per million.

Debate, before the Reference Committee on Hygiene, Public Health and Industrial Health, started fairly early in the morning of the second day of the session and continued through most of the afternoon. Proponents of the measure included a number of public health officials as well as non-physician scientists and engineers brought to Philadelphia to testify. Opponents of fluoridation were mostly physicians in private practice.

The reference committee concluded that fluoridation of water supplies is a safe and practical method of re-

LIVERMORE SANITARIUM

This facility provides an informal atmosphere seldom found in hospitals elsewhere. A sound and scientific approach to emotional problems is provided with careful deliberation, with the patients' best interests given every consideration. Our approach is eclectic with emphasis along the lines of dynamic and psychobiologic psychiatry. Every recent therapy is available.

Individual services are amply provided for; in individual cottages if desired, so that the patient's every need is considered.

All diagnostic and ancillary consultative services are available.

Information upon request.

ducing incidence of dental caries during chlidhood, agreed with conclusions of the joint committee and recommended approval of the report. After spirited debate lasting almost an hour, the House registered unmistakable agreement with the recommendation of the reference committee.

Flu Vaccine and UMW Fund Considered

Unsatisfactory handling of distribution of influenza vaccine brought out a small flury of resolutions indicating widespread resentment. The house adopted a substitute resolution calling for the Board of Trustees to seek conferences, through already established committees, with a view to establishing a code of practices regulating future distribution of important therapeutic products.

Second only to fluoridation in interest was the continuing problem created by the United Mine Workers Retirement Fund. It was the subject of a vigorously worded resolution from the Colorado delegation.

The UMW Fund has established clinics and hospitals in a number of mining areas and wherever it has beneficiaries has tried to establish selected panels of physicians to render service to miners' families. Medical organizations, county, state and national have seen volation of the principle of free choice of physician in these actions and have attempted to reach agreement with the Fund to preserve the rights of patients. At the New York meeting in June 1957 the House adopted a carefully prepared document, "Guides to Relationships Between State and County Medical Societies and the United Mine Workers Welfare and Retirement Fund." The Colorado resolution accuses the Fund of disregarding the Guides and states that they have been disavowed by the medical director of the fund (Warren Draper, M.D.).

Colorado Resolution Adopted

The resolution was amended without changing its import. As adopted, it reads as follows:

"Whereas, The United Mine Workers of America Welfare and Retirement Fund has disregarded the 'Guides to Relationships Between State and County Medical Societies and the U.M.W.A. Welfare and Retirement Fund' which were adopted by this House of Delegates in New York in June, 1957; and

"Whereas, The Medical Director of that Fund has publicly disavowed these adopted principles and has publicly stated that his organization will not observe them; and

"Whereas, The Fund has, throughout the United States, arbitrarily further abrogated the right of the Fund's beneficiaries to a free choice of physicians and hospitals effective October 15, 1957; and

"Whereas, These activities of the Fund appear to be a part of a broad general plan to reduce the practice of medicine to a state of servility, against the public interest; and

"Whereas, All systems of medical care which deny patients their inalienable right to free choice of physician and hospital result in deterioration in the quality of medical care, therefore be it

"*Resolved*, That this House of Delegates condemns the current attitude and method of operation of the U.M.

W.A. Welfare and Retirement Fund as tending to lower the quality and availability of medical and hospital care to its beneficiaries; and be it further

"*Resolved*, That a broad educational program be instituted at once by the American Medical Association to inform the general public, including the beneficiaries of the Fund, concerning the benefits to be derived from preservation of the American right to freedom of choice of physicians and hospitals as well as observance of the 'Guides to Relationships Between State and County Medical Societies and the U.M.W.A. Welfare and Retirement Fund' adopted by this House last June."

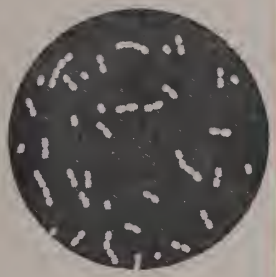
Heller Report of Great Interest

Third subject of more than ordinary interest was the Heller Report. This is a comprehensive communication from a business management firm, Robert Heller and Associates of Cleveland, after detailed investigation of organization and operation of the American Medical Association. The report from the Heller organization was received a short time before the 1957 New York meeting. It has been studied by the Board of Trustees and by a special committee. Chairman of the study committee, William A. Hyland of Michigan, presented analysis of the study committee to the House.

In order to understand implications of the Heller Report, it is necessary to recall that government of the American Medical Association, like that of the United Stats, has three branches—legislative, executive and judicial. Supreme Court of the Medical Association is the Judicial Council to which may be appealed decisions of appropriate bodies of state associations which in turn hear appeals from county society decisions. Executive function of the Association rests in the Board of Trustees, subservient to policy decisions of the House but with final authority over management and fiscal matters. The House of Delegates is a unicameral legislative body in which representation is proportionate to state association membership. The House alone has authority to establish policy for the American Medical Association and elects officers, including members of the Board of Trustees.

Only certain portions of the Heller Report, affecting policy, were discussed by the House. Many of the recommendations made by the business management analysts concerned managerial structure and operation of the headquarters building at 535 North Dearborn Street, Chicago. Some of these have already been put into operation by the Board of Trustees but some have been disregarded. The Heller organization recommended sale of the present headquarters building and erection of a new building on less expensive land. Careful study by the Board of Trustees resulted in decision to rehabilitate and modernize the present building instead. Other administrative changes included plans for revitalizing the popular magazine *Today's Health*, some changes in responsibility of the Editor of *JAMA* and plans for the Standard Nomenclature of Diseases and Operations.

Reference Committee Recommendations Adopted



After agreeing that the above administrative items need not be considered, the House adopted the following recommendations of the Reference Committee on

(Continued from page 114)

Amendments to the Constitution on Bylaws, to which the Hyland Committee Report was assigned:

1. We concur in the recommendation that the office of Vice-President be continued as an elective office.

2. We concur in the recommendation that the offices of Secretary and Treasurer be combined into one office to be known as Secretary-Treasurer, that office to be selected by the Board of Trustees from one of its number.

3. We concur in the recommendation that the duties of Secretary-Treasurer be separated from those of Executive Vice-President.

4. In regard to recommendation No. 4 we concur that the office of General Manager be discontinued, that the office of Executive Vice-President be established and that the position of Executive Vice-President be filled by appointment by the Board of Trustees. We further recommend that the Executive Vice-President be the chief staff executive of the Association.

5. In regard to recommendation No. 5, we agree that the Council on Medical Education and Hospitals and the Council on Medical Service should continue in all respects as standing committees of the House of Delegates as they presently are. We recommend however that the administrative direction of these Councils be vested in the Executive Vice-President.

6. We concur in the recommendation that the voting members of the Board of Trustees be limited to eleven, namely, the nine elected Trustees, the President and the President-Elect. The Vice-President and the Speaker and Vice-Speaker of the House of Delegates shall attend all meetings, including executive sessions, of the Board with right of discussion but without the right to vote.

7. In regard to recommendation No. 7 based on the unanimous expression of opinion of those who appeared before us, your committee recommends disapproval of election of Trustees from each of the nine physician-population regions proposed in the Heller Report.

"PROOF IN PRACTICE"

a study of 12,880 hypertensive patients

No. of Patients	Results	Percent
3,929	excellent	30.5%
6,393	good	49.6%
1,535	fair	11.9%
596	unsatisfactory	4.6%
427	side effects	3.3%

The tabulations at the left are from the recently completed study on cryptenamine (Unitensen) in which 12,880 patients and 1,384 physicians participated. Evaluation of the drug was based on experience in everyday private practice.

A summary of the "proof in practice" study is available upon request from the Medical Director of Irwin, Neisler & Co.

UNITENSEN®

Each Unitensen tablet contains cryptenamine (tannates) 2.0 mg.

UNITENSEN-R®

Each Unitensen-R tablet contains cryptenamine (tannates) 1.0 mg., Reserpine 0.1 mg.

Clinical supplies available upon request.

Neisler

Irwin, Neisler & Co. • Decatur, Illinois

(Continued from page 116)

8. We concur in the recommendation that the office of Assistant Executive Vice-President be established and that the office of Assistant Secretary be discontinued.

9. We concur in the recommendation that the Committee on Federal Medical Services should not be a part of the Council on National Defense. We recommend that this committee be retained as a Committee of the Council on Medical Service as it is at the present time.

10. In regard to recommendation No. 10, your reference committee recommends that a joint and continuing committee of 6 be appointed, 3 from the Board of Trustees and 3 from the House of Delegates, whose duties shall be to consider:

(a) Redefinition of the central concept of AMA objectives and basic programs;
(b) Placing more emphasis on scientific activities;
(c) Taking the lead in creating more cohesion among national medical societies; and
(d) Studying socio-economic problems.

Your reference committee recognizes that the recommendations which have been adopted will necessitate changes in our Constitution and Bylaws. Your committee therefore recommends that the recommendations which have been accepted be referred to the Council on Constitution and Bylaws with a request to draft appropriate amendments for the consideration of this House at the San Francisco, 1958 session.

Disability Guide Praised

Idaho should take pride in the comment of the reference committee which considered the newly prepared, "Guide to the Evaluation of Permanent Impairment of the Extremities and Back." Quentin Mack, of Boise, has made substantial contribution to the guide, primarily designed to aid physicians in estimating disability of those making claims under social security provisions but destined to have much wider application. The reference committee said, "Your reference committee wholeheartedly agrees with the Board that the Committee on Medical Rating of Physical Impairment has done a superb job on this difficult subject and looks forward with pleasure to the publication of such guides in the *Journal of the American Medical Association.*"

It was reported that the guide will be published in the form of a pocket-size book after it has been made available for trial by publishing in the *Journal.*

Forand Bill Condemned

The Forand Bill, H. R. 9467, was condemned as a type of socialized medicine and the Board of Trustees was commended for taking prompt action in opposing its passage. The bill would amend the social security laws to provide that the federal government pay hospital and medical-surgical bills for certain beneficiaries. Dangers in the bill were also pointed out by AMA President, David Allman in his address to the house.

House Handles Large Volume of Work

A surprising volume of work was handled by the House. Actions in addition to those mentioned above included:

Approval of "Guiding Principles for an Occupational Health Program in a Hospital Employee Group."

Establishment of a new committee to study neurological disorders in industry.

Approval of establishment of American Medical Research Foundation.

Ordering informational material sent to alternate delegates as well as delegates.

Declaring it proper for physicians to join in partnership or group practice so long as ownership and control remained in the hands of licensed physicians.

Authorizing conferences with third parties to determine policies and general principles.

Approving a conference on veterans' medical care.

Asking the Board of Trustees to study possibility of the Association providing funds for a study, by a qualified private agency, of the social security system.

Reaffirming support of Jenkins-Keogh Bill.

Recommending overhaul of the medical department of Civil Aeronautics Commission, with a medical director responsible to the CAA Administrator.

Scientific Exhibits—*Facing Page:* The scientific and technical exhibits at the Philadelphia session had wide attendance and invoked great interest among those visiting the booths. Pictured here are just a few of the great number of exhibits, including the special exhibit on the history of medicine in Philadelphia.

TRYPTAR® ANTIBIOTIC OINTMENT

first cleans the wound by enzymatic digestion of tissue debris

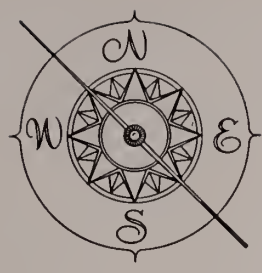
then provides full antibiotic action to prevent and combat infection

Essentially All Wounds Are Dirty

In any breach of skin surface Tryptar Antibiotic Ointment **promotes** and speeds healing... **reduces** inflammation, edema and pain... **overcomes** odors ... **improves** local circulation... **softens** crusts... **helps** produce healthy granulation tissue... and **prevents** edema and infection.

FOR THE FIRST TIME, Tryptar Antibiotic Ointment combines:

2 enzymes	Trypsin Chymotrypsin	for rapid digestion of tissue debris
2 antibiotics	Bacitracin Polymyxin	for rapid healing of cleaned wounds



Safe, virtually nonsensitizing, does not affect living tissue. There are no known contraindications.

Each gram of Tryptar Antibiotic Ointment contains:

Trypsin (crystalline).....5000 Armour Units
Chymotrypsin (crystalline)...5000 Armour Units
Bacitracin U.S.P..... 500 units
Polymyxin B Sulfate U.S.P...5000 units
in a smooth-flowing ointment base of excellent water solubility

Supplied: in ½ oz. and 2 oz. tubes.

The following books have been received. Publication of this acknowledgment is to be considered adequate return to the sender. Selected titles will be reviewed as space permits.

Management of Complications in Eye Surgery: Avoidance of Pitfalls and Treatment of Difficult Situations in Ophthalmologic Operations. Edited by R. M. Fasanella, M.D., Chairman of Section of Oph- pp. Illustrated. Price $16.00. W. B. Saunders Company, Philadelphia and London. 1957.

A Text-Book of X-Ray Diagnosis By British Authors in Four Volumes. Volume I. Ed. 3. Edited by S. Cochrane Shanks, M.D., F.R.C.P., F.F.R., Director, X-ray Diagnostic Department, University College Hospital, London; and Peter Kerley, C.V.O., C.B.E., M.D., F.R.C.P., F.F.R., D.M.R.E., Director, X-ray Department, Westminster Hospital; Radiologist, Royal Chest Hospital, London. 521 pp. 533 illustrations. Price $18.00. W. B. Saunders Company, Philadelphia and London. 1957.

Roentgen Diagnosis of Abdominal Tumors in Childhood. By Charles M. Nice, Jr., M.D., Ph.D.; Alexander R. Margulis, M.D.; and Leo G. Rigler, M.D., All from the Department of Radiology, University of Minnesota Medical School, Minneapolis, Minnesota. 75 pp. Illustrated. Price $4.00. Charles C Thomas, Springfield, Ill. 1957.

Fun Comes First for Blind Slow-Learners. By Mildred Blake Huffman, B. E., M.A., Primary Teacher, California School for the Blind, Berkeley, California; with a Foreword by Samuel A. Kirk, Ph.D., Director, Institute for Research on Exceptional Children, University of Illinois, Urbana, Illinois. 157 pp. Illustrated. Price $5.00. Charles C Thomas, Springfield, Ill. 1957.

Tuberculosis—Every Physician's Problem. By J. Arthur Myers, M.D., Professor of Internal Medicine and Public Health, Medical and Graduate Schools, University of Minnesota, Minneapolis, Minnesota. 290 pp. Illustrated. Price $7.50. Charles C Thomas, Springfield, Ill. 1957.

Recovery from Schizophrenia; The Roland Method. By John Eisele Davis, Sc.D., President, Association for Physical and Mental Rehabilitation; Formerly Chief, Corrective Therapy, Veterans Administration. 161 pp. Price $4.75. Charles C Thomas, Springfield, Ill. 1957.

Microtechniques of Clinical Chemistry for the Routine Laboratory. By Samuel Natelson, Sc.M., Ph.D., Chairman, Department of Biochemistry, Rockford Memorial Hospital, Rockford, Illinois. 484 pp. Illustrated. Price $11.00. Charles C Thomas, Springfield, Ill. 1957.

Anatomies of Pain. By K. D. Keele, M.D., F.R.C.P., Consultant Physician, Ashford Hospital and Staines Hospital, England. 206 pp. Illustrated. Price $5.50. Charles C Thomas, Springfield, Ill. 1957.

Advances in Radiobiology: Proceedings of the Fifth International Conference on Radiobiology Held in Stockholm on 15th-19th August, 1956. Edited by George Carl de Hevesy, Arne Gunnar Forssberg, and John D. Abbatt. 503 pp. Illustrated. Price $15.50. Charles C Thomas, Springfield, Ill. 1957.

Clinical Electrocardiography—The Spatial Vector Approach. By Robert P. Grant, M.D., National Heart Institute, National Institutes of Health, Bethesda, Maryland. 225 pp. Illustrated. Price $7.50. Blakiston Division, McGraw-Hill Book Company, Inc., New York. 1957.

Deafness, Mutism and Mental Deficiency in Children. By Louis Minski, M.D., F.R.C.P., D.P.M., Consultant Psychiatrist, Royal National Throat, Nose and Ear Hospital, Gray Inn Road; Associate Psychiatrist, St. George's Hospital, Hyde Park Corner. 82 pp. Illustrated. Price $3.75. Philosophical Library Inc., New York. 1957.

Cerebral Lipidoses—A Symposium convened in Antwerp, Belgium, July 1955, Chairman, L. van Bogaert, M.D., Director, Department of Neurology and Neuropathology, Institut Bunge, Antwerp. Edited by J. N. Cumings, M.D., F.R.C.P., Clinical Pathologist, The National Hospital; Director, Department of Biochemical Research, Institute of Neurology, London; and A. Lowenthal, M.D., Department of Neurology and Neuro-Chemical Research, Institut Bunge, Antwerp. 212 pp. Illustrated. Price $8.50. Charles C Thomas, Springfield, Ill. 1957.

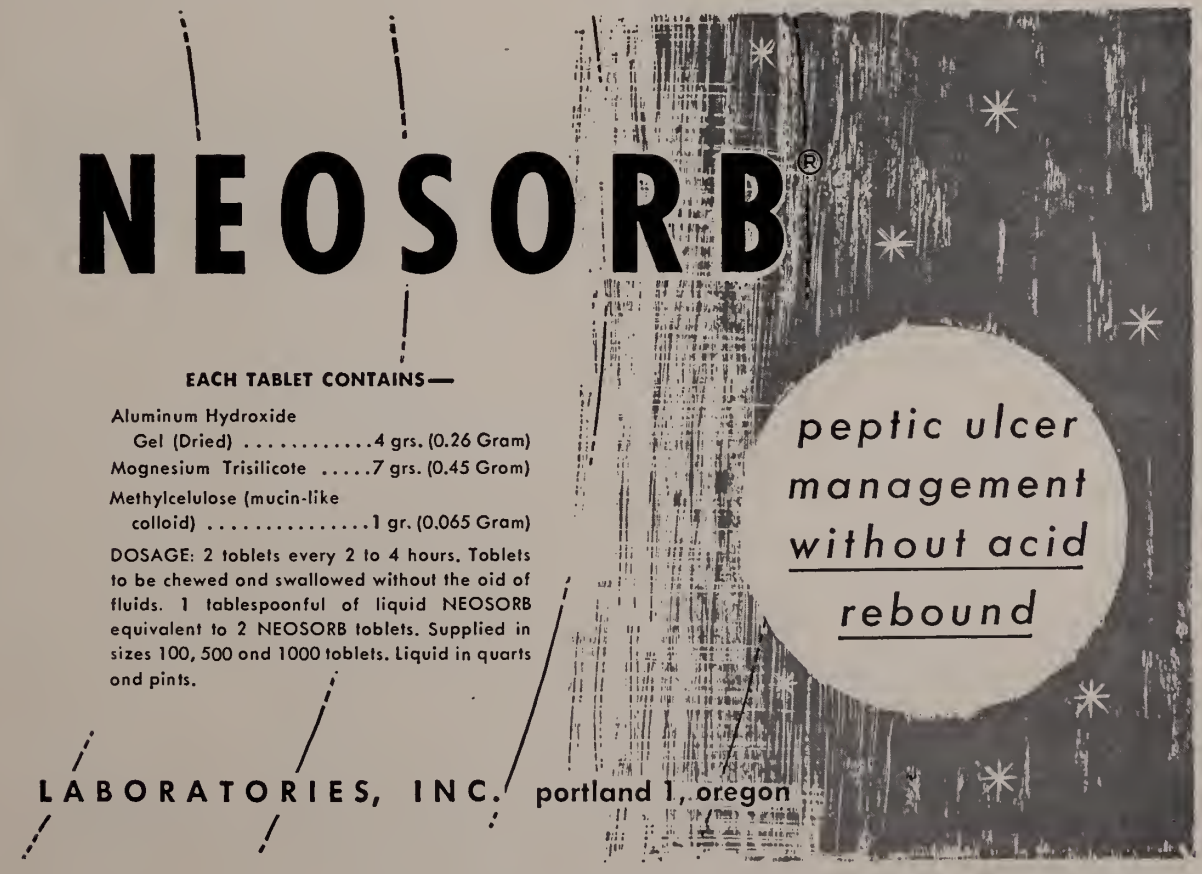
Inhalation Analgesia in Childbirth. By E. H. Seward, M.A., D.M. (Oxon.), F.F.A.R.C.S., D.Obst. R.C.O.G., Consultant Anaesthetist, High Wycombe Group of Hospitals; Formerly, Research Assistant, Nuffield Department ofAnaesthetics, University of Oxford; and R. Bryce-Smith, M.A., D.M. (Oxon.), F.F.A.R.C.S., First Assistant, Nuffield Department of Anaesthetics, University of Oxford; Formerly Assistant Professor of Anaesthesia, Western Reserve University, Cleveland, Ohio. 58 pp. Price $1.50. Charles C Thomas, Springfield, Ill. 1957.

Child Psychiatry. Ed. 3. By Leo Kanner, M.D., Professor of Child Psychiatry, The Johns Hopkins University; Director, Children's Psychiatric Service, The Johns Hopkins Hospital, Baltimore, Maryland. With Prefaces by John C. Whitehorn, M.D., Henry Phipps Professor of Psychiatry, The Johns Hopkins University; Adolf Meyer, M.D., LL.D., Henry Phipps Professor Emeritus of Psychiatry, The Johns Hopkins University; and Edwards A. Park, M.D., Professor Emeritus of Pediatrics, The Johns Hopkins University, 777 pp. Price $8.50. Charles C Thomas, Springfield, Ill. 1957.

Practical Use of Office Laboratory and X-Ray Including Electrocardiograph. By Paul Williamson, M.D., 323 pp. Illustrated. Price $10.75. The C. V. Mosby Co., St. Louis. 1957.

Ciba Foundation Colloquia on Endocrinology, Vol. II: Hormones in Blood. Edited by G. E. W. Wolstenholme, O.B.E., M.A., M.B., B.Ch.; and Elaine C. P. Millar, A.H.-W.C., A.R.I.C. 416 pp. Price $9.00. Little, Brown and Company, Boston. 1957.

REVIEWS



Books reviewed in the columns of Northwest Medicine may be borrowed by any subscriber. Write Miss Ruth Horlamert, Librorian, King County Medical Society Library, Room 121, Cobb Bldg., Seattle 1, Wn. The library oppreciates, but does not demond, reimbursement for postage.

THE GLAUCOMAS, Ed. 2. By H. Saul Sugar, M.D., Assistant Professor in Ophthalmology, Wayne University Medical School, Detroit. 516 pp. Illustrated. Price $13.50. Hoeber-Harper, New York. 1957.

Sugar's book has been revised and enlarged. Descriptive illustrations have been added to the new second edition.

A chapter on tonography of practical value to the practicing ophthalmologist has been added. In addition, medical management of the primary glaucomas has been arranged into one section, just preceding

symptomatic relief . . . plus!

Achrocidin*

TETRACYCLINE-ANTIHISTAMINE-ANALGESIC COMPOUND

ACHROCIDIN is a well-balanced, comprehensive formula for treating acute upper respiratory infections.

Debilitating symptoms of malaise, headache, pain, mucosal and nasal discharge are rapidly relieved.

Early, potent therapy is offered against disabling complications to which the patient may be highly vulnerable, particularly during febrile respiratory epidemics or when questionable middle ear, pulmonary, nephritic, or rheumatic signs are present.

ACHROCIDIN is convenient for you to prescribe—easy for the patient to take. Average adult dose: two tablets, or teaspoonfuls of syrup, three or four times daily.

tablets

ACHROMYCIN® Tetracycline	125 mg.
Phenacetin	120 mg.
Caffeine	30 mg.
Salicylamide	150 mg.
Chlorothen Citrate	25 mg.

Bottle of 24 tablets

syrup

Each teaspoonful (5 cc.) contains:

ACHROMYCIN® Tetracycline equivalent to tetracycline HCl	125 mg.
Phenacetin	120 mg.
Salicylamide	150 mg.
Ascorbic Acid (C)	25 mg.
Pyrilamine Maleate	15 mg.
Methylparaben	4 mg.
Propylparaben	1 mg.

Available on prescription only

LEDERLE LABORATORIES DIVISION, AMERICAN CYANAMID COMPANY, PEARL RIVER, NEW YORK

(Continued from page 125)
the section on surgical treatment of glaucoma, making for ease in reference.

The anatomy and histology chapters have been expanded to include some of the newer concepts of the anatomy of the angle.

The tonometry and tonography sections include copies of essential tables such as the 1948, 1954 and 1955 tonometer scales from the Committee on Tonometry of the American Academy of Ophthalmology and Otolaryngology, as well as Grant's tables for tonography.

Perimetry, gonioscopy and diagnostic technics are presented in detail in separate chapters.

As in the first addition, there are numerous references to the literature with an excellent bibliography following each chapter.

Sugar's "The Glaucomas" remains the outstanding standard text on glaucoma and this new revised and enlarged edition should replace the earlier edition on the ophthalmologist's shelf.

Wood Lyda, M.D.

HOST-PARASITE RELATIONSHIPS IN LIVING CELLS: A Symposium Sponsored by James W. McLaughlin Fellowship Program, University of Texas, Medical Branch, Galveston, Texas, April 27, 1956. Compiled and edited by Harriet M. Felton, M.D. 245 pp. Illustrated. Price $6.50. Charles C Thomas, Springfield, Ill. 1957.

The outstanding feature of this small book is a superb discussion by Professor Robert A. Good of the University of Minnesota of the evidence relating macrophages, lymphocytes, and plasma cells to antibody formation and hypersenstivities. His own impressive recent contributions, based on his creditable earlier research on animals, has been focused chiefly on study of patients with disturbances of plasma cells and of gamma globulin metabolism.

Drs. John H. Hanks, R. Dulbecco, and Rene J. Dubos provide excellent brief discussions of the metabolic and biological relationships involved in the relationship of tissue cells to their intracellular parasites with emphasis on viruses and on mycobacteria.

Discussions of certain topics such as electron microscopy of cells are too abbreviated to be of much value. The rather weighty discussion is pleasantly leavened by the delightful personality of Dr. Hanks, who at one point, for example, comments: "Points of view are little mental mountains which we all climb at times to scout the land, never knowing how long we are going to stay."

Charles A. Evans, M.D.

MECHANISMS OF HYPERTENSION WITH A CONSIDERATION OF ATHEROSCLEROSIS. By Henry Alfred Schroeder, M.D., Associate Professor of Medicine and Director, Hypertension Division, Department of Internal Medicine, Washington University of Medicine, St. Louis. 379 pp. Illustrated. Price $9.00. Charles C Thomas, Springfield, Ill. 1957.

This book of 379 pages is broken down into some of the many known causes of hypertension. It devotes approximately half of its contents to a discourse on the complexities of the disease and the relative importance of basic factors, neurogenic factors, nepherogenic mechanism, and the conversion from neurogenic to nepherogenic. It then digresses for fifty pages on the importance of trace metals in cardiovascular disease, and thereafter spends approximately the same amount of space commenting on the mechanisms in atherosclerosis. Finally, treatment of hypertension and atherosclerosis is commented on in the last fifty pages. A small banner on the cover indicates that this is from the American Lecture Series, and one indeed has the impression that a collection of lectures was amalgamated, made to fit inside a binding, stamped "Mechanisms of Hypertension" and hence, forwarded to the public. The author is a man of vast knowledge concerning hypertension, and a great many of the known interlocking and puzzling causes of this disease are commented on in succinct form. The author indeed points out that the subject is a state of flux and much remains to be done, and that he merely wishes to arouse our interest and lead us to think further; he does this well. This volume would be more aptly entitled "Thoughts on the Mechanisms of Hypertension." There are some very good illustrations and simple graphs, and pertinent tables and formulas which are in discord with such esoteric information as the amount of chromium in the kidney tissue of twelve Africans, whose ages are given, and furthermore, whose tissues were preserved in formalin. Such information hardly fits the cover which pronounces that "the patient is foremost in mind through the book." This volume is for thinkers interested in hypertension and willing to sit through a course of lectures which refresh and stimulate the mind as to some of the many causes and treatments of hypertension and atherosclerosis.

Jean C. Michel, M.D.

EXTENSILE EXPOSURE. Ed. 2. By Arnold K. Henry, M.B., Dublin; M.Ch. (Hon.), Trinity College, Dublin, and Cairo; F.R.C.S.I.: Chevalier de la Legion d'Honneur; Emeritus Professor of Clinical Surgery in University of Egypt; Professor of Anatomy in Royal College of Surgeons, Ireland. 320 pp. Illustrated. Price $10.00. The Williams and Wilkins Co., Baltimore. 1957.

To those who are acquainted with Henry's earlier books, called "Extensile Exposure Applied to Limb Surgery" of 1946, and "Exposures of Long Bones" of 1927, it may be said that the present edition of Extensile Exposures is primarily an enlargement of the 1946 edition to include descriptions of exposures of the front and side of the neck, the vertebral artery, the thorax from the root of the neck, the posterior cervical rami, and certain approaches of the chest and hypogastrium. The material in regard to the extensile exposure of the extremities is largely unchanged in the present edition.

Anyone not acquainted with Professor Henry's writings will find a rare treat in this last edition. It is urged that every beginner carefully read the preface to the second and first edition and introduction before starting to read the anatomical descriptions. Dr. Henry consciously tries to avoid usual anatomical terms because of confusion between different systems of anatomical nomenclature. His very apt use of terms such as "half-sleeve," "loop-holes," and "satellite" are very descriptive terms when one understands their meaning. By extensile, the author means an approach that may reach out or be extended from the original incision to extend into a greater exposure as circumstances may arise at surgery. His exposures in regard to the long bones have long been known for their usefulness in this regard. The written description is masterful and gives stage-by-stage a manner in which important structures are encountered and identified in each exposure. The illustrations are definitely secondary to the written word.

I heartily recommend Dr. Henry's latest book as excellent reading, not only in immediate preparation for an unaccustomed surgical procedure, but also as entertaining reading for anyone who enjoys masterly verbal depiction.

J. Irving Tuell, M.D.

BEDSIDE DIAGNOSIS. Ed. 4. By Charles Seward, M.D., F.R.C.P. (Edin.). With a foreword by Lord Cohen of Birkenhead, M.D., D.Sc., LL.D., F.R.C.P., F.A.C.P., F.F.R., Professor of Medicine, University of Liverpool. 429 pp. Price $5.00. The Williams and Wilkins Company. 1957.

This book has been written by a British general physician for the medical student and the doctor. In this fourth edition there has been revision of over half of the 430 pages. Descriptions of newly recognized conditions have been included. Using symptoms and signs, the most likely cause of disease can be determined. Each chapter deals with specific symptoms and starts with a synopsis of causes. This book can be of great help in arriving at a diagnosis. Treatment is not discussed. The last chapter is on normal values and concludes with notes on the interpretation of these values. This handbook has proven very popular and is one which any physician will find convenient to use.

Bertram L. Trelstad, M.D.

VIRIATRIC

geriatrics feel better... faster... longer

without stimulation... without letdown

We won't predict that pole vaulter... Class of '19... is going to make it...

We don't recommend such strenuous exercise for geriatric patients... even when they're faithfully taking *Viriatric* tablets.

We *do* recommend that you prescribe *Viriatric* for geriatric patients and we do predict that they'll feel better... faster... longer... without alcoholic or amphetamine stimulation... when they take two *Viriatric* tablets twice a day.

In cases where stimulants are advisable, they may be prescribed separately.

Some of the important *Viriatric* features are...

Glycine and L-Lysine provide amino acid supplements
Balanced blend of hormones help prevent metabolic degeneration
Balanced blend of digestive enzymes for improved digestion
Niacinamide promotes psychiatric orientation, improved skin tone, muscular and joint mobility

Ethically promoted *Viriatric* Tablets... for geriatrics... available at all pharmacies in bottles of 100.

BOYLE **BOYLE** & COMPANY, Los Angeles 54, California

Each Viriatric tablet contains:

Methyl Testosterone	0.75	mg.
Ethinyl Estradiol	0.0045	mg.
Vitamin A	1500	U.S.P. Units
Vitamin D	150	U.S.P. Units
Vitamin B-1	1.5	mg.
Vitamin B-2	1.5	mg.
Vitamin B-6	0.375	mg.
Vitamin B-12 with Intrinsic Factor Concentrate USP	1/40	Unit
Vitamin B-12 Activity	0.5	mcg.
Folic Acid	0.09	mg.
Niacinamide	37.5	mg.
Panthenol	2.5	mg.
Biotin	2.5	mcg.
Vitamin C	37.5	mg.
Hesperidin Purified	6.3	mg.
Rutin	3.75	mg.
Vitamin E	2.5	mg.
Choline Bitartrate	100.0	mg.
L-Lysine Monohydrochloride	37.5	mg.
Inositol	12.5	mg.
Betaine Hydrochloride	25.0	mg.
Pancreatin	24.3	mg.
Pepsin	24.3	mg.
Bile Acids Mixed Oxidized	6.25	mg.
Glycine (Aminoacetic Acid NF)	12.5	mg.
Iron (Ferrous Sulfate, Dried)	5.0	mg.
Copper	0.00017	mg.
Iodine	0.04	mg.
Calcium	70.0	mg.
Manganese	0.5	mg.
Potassium	2.5	mg.
Magnesium	2.5	mg.
Zinc	0.38	mg.
Molybdenum	0.025	mg.

THE MENTALLY ILL CHILD: A Guide for Parents. By Steven B. Getz, Ph.D., School Psychologist, California School for the Deaf, Berkeley, California; and Elizabeth Lodge Rees, M.D., Fellow of American Academy of Pediatrics, Hayward, California. 88 pp. Price $3.50. Charles C Thomas, Springfield, Ill. 1957.

Dr. Getz, a psychologist, and Dr. Rees, a pediatrician, undertook the very laudable task of composing a manual for the parents of the mentally ill child. Their intent to furnish information regarding diagnosis, treatment and home management of the young patient as well as to lend support to the worried elders by answering anticipated questions is offered in 65 pages. Brevity, clarity of content and simplicity of style are of course mandatory for a text designed for lay consumption. Unfortunately, the authors carried that endeavor frequently to the point of misleading ambiguity and confusing deletions in the subject matter and licentious neglect of expression and sentence structure. In the second chapter this "Guide for Parents" tells its presumably anxious readers of former child sacrifices, infanticide, abandonment of unwanted babies, destruction of imperfect children, infant mortality, etc., a not too tactful historical introduction for a troubled father and mother. Yet, there is a good deal in this small volume which is of value and which suggests the authors' good will and honest efforts. The pages suggest, however, that a book with the title "The Mentally Ill Child" had perhaps better be written by specialists in the field than by a psychologist who is neither a psychiatrist nor a neurologist and by a pediatrician who is none of the three.

Gert Heilbrunn, M.D.

STEDMAN'S MEDICAL DICTIONARY of Words Used in Medicine with Derivations and Pronunciations Including Dental, Veterinary, Chemical, Botanical, and other Special Terms; Anatomical Tables of Titles in General Use, the Terms Sanctioned by Basle Anatomical Convention; New British Anatomical Nomenclature; Nomina Anatomica, Revised by the Fifth International Nomenclature Congress of Anatomists; Pharceutical Preparations Official in U.S. and British Pharmacopoeias or Contained in National Formulary; Biographical Sketches of Figures in History of Medicine. Ed. 19, revised. Edited by Norman Burke Taylor, V.D., M.D., F.R.S.C., F.R.C.S. (Edin.) F.R.C.P. (Can.), M.R.C.S. (Lon.), University of Western Ontario and formerly of the University of Toronto; in Collaboration with Lieut. Col. Allen Ellsworth Taylor, D.S.O., M.A., Classical Editor. 1656 pp. Price $12.50. The Williams & Wilkins Company, Baltimore. 1957.

This dictionary has been thoroughly revised. Such a change may mean much for the reader. It does, in this instance. The valuable derivations are maintained, because citizenship of words is often neglected. Increase of vocabularly is obvious for the book is much larger. There is greater wealth of definitions, clearly and cleanly stated. The reader will be surprised to find how few words are needed to define a subject, and will be delighted to find definitions shorn of gabbling, extraneous wording. It is a pleasure to use this larger sized book with its invigorating expressions.

Purman Dorman, M.D.

MICROTECHNIQUES OF CLINICAL CHEMISTRY FOR THE ROUTINE LABORATORY. By Samuel Natelson, Sc.M., Ph.D., Chairman, Department of Biochemistry, Rockford Memorial Hospital, Rockford, Ill. 484 pp. Illustrated. Price $11.00. Charles C Thomas, Springfield, Ill. 1957.

The practice experience of a pioneer in the field of micro techniques, who has successfully established usable methods in a wide variety of chemical tests, is depicted in this book. Pictorial illustrations and diagrams add to the ease of interpretation and understanding of the context. A very helpful adjunct for the novitiate is the inclusion of references to the sources from which the specialized equipment and glassware may be obtained commercially. Advantages and disadvantages of certain types of instruments are described.

Dr. Natelson takes the reader from the principles utilized in micro chemistry through the technique of sampling the small quantity of specimen to the methodology in the various tests. An appendix discusses instrumentation, evaluation of accuracy and precision in methodology, normal values and the

application of chelate formation in clinical chemistry.

Whether or not one always agrees with the author's choice of method for a particular determination, this book will be of invaluable help to the clinical pathologist and clinical chemist interested in introducing micro techniques as routine procedures in the laboratory.

S. A. Creighton, M.D.

NEW RESEARCH TECHNIQUES OF NEUROANATOMY: A Symposium Sponsored by the National Multiple Sclerosis Society. Edited by William F. Windel, Ph.D., Sc.,D., Chief, Laboratory of Neuroanatomical Sciences, National Institute of Neurological Diseases and Blindness, National Institutes of Health, Bethesda, Maryland. Foreword by Frederick L. Stone, Ph.D., Director, Medical and Scientific Department, National Multiple Sclerosis Society, New York, N. Y. 98 pp. Illustrated. Price $4.75. Charles C Thomas, Springfield, Ill. 1957.

This book provides a brief look into some of the newer techniques used in neuroanatomy. It would be of particular value to the neurologist or neurosurgeon who is interested in keeping in touch with advances in this particular field, and would be of interest to the general pathologist who wants a short summary of methods used in tissue study.

The book is divided into sections, each by a different author, each providing a brief summary of the technique used, results expected, and future hopes in several fields of tissue research. A good review of electron microscopy in the field of neuroanatomy is provided, and it indicates that in the few years this technique has been used, much new knowledge has already been added to the field of neuroanatomy. The classic example is that of the Golgi apparatus—a finding that has evoked much discussion in the past. This has now been found to be an artifact by use of the electron microscope, but it has also complicated the problem more in that it indicated that the Golgi apparatus delineated the position and configuration of a complex system of membranes and vesicles which are not completely understood.

In addition, newer techniques in silver impregnation of degenerating axones are discussed, and selective silver impregnation of synaptic endings as well as the results of tissue culture studies of neural tissue. There is also a chapter discussing the variability of blood flow to different parts of the brain and brain stem.

Discussion is also presented of the cholinesterases and histological chemistry of the nervous system.

All in all, this is a very good book. It can be read rapidly, in a period of an hour, and will give anyone interested in this field a short view of advances that are being made by the application of the newer techniques in the field of neuroanatomy.

John R. Mullins, M.D.

TECHNIQUE OF FLUID BALANCE: PRINCIPLES AND MANAGEMENT OF WATER AND ELECTROLYTE THERAPY. By Geoffrey H. Tovey, M.D., Director, South West Regional Blood Transfusion Service, Southmead, Bristol; Lecturer in Haematology, University of Bristol. 100 pp. Price $2.50. Charles C Thomas, Springfield, Ill. 1957.

This concise, fairly well written little manual is stripped to the bones of excess material. The techniques and problems of fluid balance are clearly presented. Aimed at the doctor in the smaller hospital, it stresses reliance on intake and output measurements, physical signs, and the Fantus test for urine chloride rather than ferquent measurements of all the serum electrolytes in estimating fluid requirements. The section on acid-base balance could be expanded to give a clearer picture of respiratory versus metabolic acidosis or alkalosis. The problems of fluid balance in children, renal shutdown, diabetic acidosis, and post surgical patients are adequately if not extensively covered. For the physician confronted with these problems who is unable to attend a fluid or electrolyte balance course at a medical school this would indeed be a handy book to have.

Warren B. Spickard, M.D.

Professional Classified

PRACTICE OPPORTUNITIES

GENERAL PRACTICE FOR SALE

Old, well established (one of city's largest) general practice for sale. Centrally located in near eastside Portland, Oregon. Practice offered for sale due to recent death of Dr. Suckow. Contact Mrs. George Suckow, 4232 N. E. Royal Court, Portland, BElmont 2-1886 or Mr. Arthur Baines, Weatherly Bldg., BElmont 5-3183, Portland, Ore.

GP ASSOCIATE WANTED

Young GP with Washington license wanted as associate in office located in large Seattle suburban district. Excellent future. State qualifications and desires. Write Box 37-A, Northwest Medicine, 1309-7th Ave., Seattle, Wash.

SPECIALIST OR GP OPPORTUNITY

Physician wanted to assume active practice grossing $37,000 in rapidly growing city of 20,000 in community of 70,000 in Eastern Washington. Commodious office space located in medical center near new 50-bed hospital. Few specialists are represented in this area, and this practice would be an excellent start for either specialist or general practitioner. Leaving to specialize. Write Box 25-A, Northwest Medicine, 1309-7th Ave., Seattle, Wash.

MENTALLY HANDICAPPED CHILDREN NEED PHYSICIAN

Physician needed for Rainier School near Tacoma, Wash. Requires person who is able to work well with children. Offers excellent opportunity for young professional man. Starting salary $8376 - $9144 depending on qualifications. Full information on request. Write Garrett Heyns, Ph.D., Director, Department of Institutions, Box 867, Olympia, Wash. or Washington State Personnel Board, 212 General Administration Building, Olympia.

EXCELLENT GP OPPORTUNITY

Home-office combination for sale at Priest River, Idaho. Very reasonably priced. Full office equipment, including 50 ma Westinghouse X-ray. New hospital 7 miles away at Newport, Wash. Physician in service; town very anxious for replacement. Contact Mr. Dick Sonntag, Priest River or Capt. H. G. Lawson, USAH, Dugway, Utah.

GENERAL PRACTICE OPPORTUNITY

For one year will rent ideal general practice office in well established medical center of mid-Washington city. Six rooms, 950 sq. ft. Fully equipped. Will introduce to active practice. Available June or July 1958. Present physician returning to restricted specialty. Write Box 40-A, Northwest Medicine, 1309-7th Ave., Seattle, Wash.

GENERAL PRACTICE OPPORTUNITY

Practice and equipment for sale in an ideal community. Will lease or sell 5 year old building with good parking space. Across from hospital. Contact Mrs. H. E. Tomlinson, 926 E. Caroline St., Port Angeles, Wash.

CLINIC, GP EQUIPMENT AVAILABLE

New (1955) clinic of approximately 1500 sq. ft. for lease. General physician and surgeon's equipment for sale. Open staff hospital in town. Excellent practice opportunity. Immediately available. Located in Western Oregon. Physician leaving for foreign mission service. Write Box 42-A, Northwest Medicine, 1309-7th Ave., Seattle, Wash.

OPPORTUNITY FOR SEMI-RETIREMENT

Physician wanted who would like to semi-retire in an attractive community of 400 population. Eight room house available, lot 100 x 200 feet, two baths, two fireplaces, sun room, all electric including heat. House completely modern, equipped with electric range, water heater, automatic washer and dryer. Two car garage, good lawn and garden. Write or call Senior Estates, Inc., VAder Axminster 5-7371, Ryderwood, Wash.

OPPORTUNITY FOR GENERAL PRACTITIONER

GP group practice with four other GPs; 30 miles from Seattle. Snoqualmie Valley Clinic, Snoqualmie, Wash. Phone 88-3352.

OPPORTUNITY FOR GENERAL PRACTITIONER

Only physician in large rural area, Northwestern Washington. Drawing area of 15,000. Very commodious office space, adequate equpiment, comfortable furniture. Reasonable terms. Write Faith Funk, R.N., Everson, Washington.

GP PRACTICE AND OFFICE FOR SALE

Busy general practice in growing Oregon community for sale at reasonable discount. Modern, completely equipped office. Leaving to take residency. Write Box 39-A, Northwest Medicine, 1309-7th Ave., Seattle, Wash.

LOCATIONS DESIRED

OB-GYN ASSOCIATION DESIRED

Completing four year residency at a University Medical Center. Married, family, category IV, age 31. Desire association, partnership or clinic practice in Pacific Northwest. Available July 1958. Write Box 41-A, Northwest Medicine, 1309-7th Ave., Seattle, Wash.

OFFICE SPACE

NEW CLINIC SPACE FOR LEASE

Clinic being built in new area with expanding population. Will tailor to suit specifications. Physicians and specialists needed. Hospital to be built nearby soon. For details call MYrtle 2342, or write Mrs. B. J. Sibon, 9619-196th S. W., Edmonds, Wash.

MEDICAL OFFICES FOR LEASE

Brick building. Ground floor suitable for three physicians or clinic. Full basement. Will remodel to suit specifications. Ideally located on Beacon Hill in Seattle near VA Hospital. Contact Mr. Dan Pretare, 9603-59th St., RAinier 5208, Seattle, Wash.

MEDICAL OFFICE FOR LEASE

New medical office with 800 sq. ft. located at Kenmore near Seattle. Adjoins dental office. Available now. Call GLadstone 3240 or FIlmore 1867, Seattle, Wash.

PLACEMENT BUREAUS

PHYSICIANS AND SURGEONS REGISTRY

If interested in re-locating, joining a group or in disposing of equipment and practice, contact us. Services strictly confidential. Continental Medical Bureau, 510 West 6th Street, Los Angeles 14, or Pacific Coast Medical Bureau, 703 Market Street, Room 1404, San Francisco 3.

(Continued from page 131)

MODERN PERINATAL CARE. By Les'ie V. Dill, M.D., Asscciate C'inical Professor, Obstetrics and Gynecology, Georgetown University School of Medicine, Washington. D.C. 309 pp. Price $6.50. Appleton-Century-Crofts, Inc., New York. 1957.

This volume, in remarkably few pages, covers a multitude of subjects related to perinatal care. Of necessity, therefore, the discussions are brief, but adequate and practical in a superficial manner. The author is to be commended for not accepting some concepts handed down from generation to generation which have never been proven and are no longer reasonable.

The book has a good bibliography and might well serve as an excellent starting point for anyone desiring to obtain the latest information on subjects related to perinatal care. For those practitioners to whom expert consultation is not readily available, it will indicate a safe and proper approach to many problems. The author has even included a short outline of the major points in the various problems and at the end of each discussion, sort of a do it yourself guide!

Here and there might be found a statement with which I would not agree, but with these few exceptions there is little which does not represent solid, generally accepted obstetrical principles.

Of particular interest is the last chapter which deals briefly with the interpretation of the attitude of the Catholic Church as pertains to obstetrical problems. The basic principles are clearly stated and should be helpful to anyone.

Bernard Gomberg, M.D.

Life Insurance Research Fund Grants Awarded to Northwest Physicians

Twelfth Annual report of the Life Insurance Medical Research Fund, covering the period from July 1, 1956 to June 30, 1957, lists grants to several physicians on the staffs of the University of Oregon Medical School and the University of Washington School of Medicine.

The Fund was organized in 1945 by a group of United States and Canadian life insurance companies for the support of medical research with the ultimate object of increasing life expectancy. At the present time, grants are awarded by the Fund to support research broadly bearing on diseases of the heart and arteries and related fundamental problems. A total of 148 companies supported the Fund as outlined in the current report.

Grants totalling $68,591.55 have been awarded to UOMS staff members. William D. Blake is to receive $28,991.55 from Oct. 1, 1952 to June 30, 1958 for research in regulation of kidney function. Dr. Blake's work is concerned with the control of glomerular filtration rate as a means of regulating body sodium content and also the effect of epinephrine on the distribution of blood flow in the kidney. The other recipient at the University of Oregon is Roy L. Swank who is being given $39,600 from July 1, 1955 to June 30, 1959. Dr. Swank is studying the suspension stability of the blood with particular interest in its relationship to fat metabolism and the role of fibrinogen.

Staff members of the University of Washington School of Medicine are scheduled to receive $154,875 in grants from the Fund. H. Stanley Bennett will receive $57,435 from July 1, 1950 to June 30, 1958 for research in fine structure of vessels. For his work in metabolism of one-carbon units, Frank M. Huennekens, Jr., Ph.D., will be given $25,300 from July 1, 1954 to June 30, 1958. Rex L. Huff and David D. Feller, Ph.D., will receive $28,340 to support their study of blood volume, blood flow and body density which is aimed to further develop radio-isotope dilution techniques. A grant of $43,800 is being awarded Donald J. Hanahan, Ph.D., from July 1, 1953 to June 30, 1959 for research in sterol metabolism and blood lipides.

Medical Library Association to Meet In Rochester, Minn., June 2-6, 1958

Fifty-seventh annual meeting of the Medical Library Association will be held in Rochester, Minn., from June 2 through June 6, 1958. Headquarters will be at the Hotel Kahler. Letters of inquiry should be addressed to Mr. Thomas E. Keys, Librarian of the Mayo Clinic and convention chairman.

Theme of the meeting is Advances in Medical Library Practice. Series of refresher courses embracing many fields of medical library work will be given with sessions being made up from the following subjects: Administration, Acquisitions, Classification, Cataloging, Non-book Materials, Photoduplication, Public Relations, Reference Work, Rare Books, History of Medicine, Bibliographic Services, Periodicals, Binding, Library Architecture, Equipment, and Medical Terminology.

A highlight of the program will be a discussion by Mayo Clinic Staff members on what the medical specialists expect from the Medical Library.

All medical librarians are cordially invited to attend.

In Asthma

MEDIHALER®

automatic measured-dose aerosol medication

For Ample Air Right Now!

NOTHING IS QUICKER • NOTHING IS MORE EFFECTIVE

Medihaler-EPI®

For quick relief of bronchospasm of any origin. More rapid than injected epinephrine in acute allergic attacks.

Epinephrine bitartrate, 7.0 mg. per cc., suspended in inert, nontoxic aerosol vehicle. Contains no alcohol. Each measured dose 0.15 mg. actual epinephrine.

Medihaler-ISO®

Unsurpassed for rapid relief of symptoms of asthma and emphysema.

Isoproterenol sulfate, 2.0 mg. per cc., suspended in inert, nontoxic aerosol vehicle. Contains no alcohol. Each measured dose 0.06 mg. actual isoproterenol.

Prescribe Medihaler medication with Oral Adapter on first prescription. Refills available without Oral Adapter.

Medihaler-Phen®

Automatic NASAL aerosol nebulization provides prompt, effective, prolonged, and nonirritating decongestion in head colds, allergic rhinitis, sinusitis, and nasopharyngitis. Vasoconstrictive, decongestive, anti-inflammatory, antibacterial. Combines actions of phenylephrine, phenylpropanolamine, neomycin, and hydrocortisone.

FOR KIDDIES TOO

Notably safe and effective for children.
Nonbreakable, spillproof.

when Pertussis strikes...

Hypertussis *is the Specific*

"a thimbleful of dosage for a handful of baby"

Hypertussis®
(anti-pertussis serum-human)
Supplied in 2.5 cc. (one dose) vials

For years, Hypertussis/Cutter has been the specific, effective weapon against whooping cough and its complications in infants. Hypertussis is the highly concentrated anti-pertussis globulin derived from large pools of fresh, venous blood from adults who have been hyperimmunized against pertussis. A 2.5 cc. injection of this homologous blood fraction provides the gamma globulin equivalent of 25 cc. of human hyperimmune serum. This 10-fold concentration eliminates the pain and inconvenience of massive dosage.

Prophylactic or therapeutic use of Hypertussis does not interfere with administration of antibiotics in cases where such therapy is indicated.

For complete information on Hypertussis and other blood fraction products . . . write Dept. 29-A

CHLOROMYCETIN®

COMBATS MOST CLINICALLY IMPORTANT PATHOGENS

Acquired resistance seldom imposes restrictions on antimicrobial therapy when CHLOROMYCETIN (chloramphenicol, Parke-Davis) is selected to combat gram-negative pathogens involving enteric and adjacent structures of the urinary tract. The acknowledged effectiveness with which CHLOROMYCETIN suppresses highly invasive staphylococci[1-9] extends to persistently pathogenic coliforms.[6,10-15] Experience with mixed groups of Proteus species, for example, "...shows chloramphenicol to be the drug of choice against these bacilli...."[15]

CHLOROMYCETIN is a potent therapeutic agent and, because certain blood dyscrasias have been associated with its administration, it should not be used indiscriminately or for minor infections. Furthermore, as with certain other drugs, adequate blood studies should be made when the patient requires prolonged or intermittent therapy.

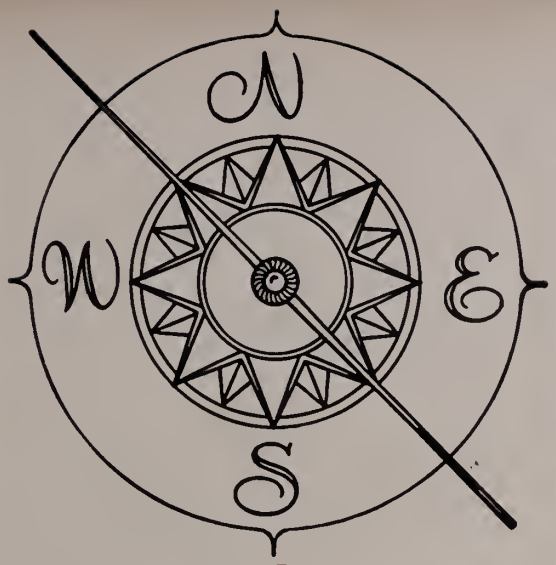
... use the new transistorized Sanborn Model 300 Visette electrocardiograph for 15 days ... without cost or obligation

The more-than-usual interest shown by doctors in the new Sanborn Model 300 Visette electrocardiograph is understandable: the Visette is the *only* instrument in history to provide *clinical accuracy in such a small, lightweight form.* And because it is so new, Sanborn Company expects that you, like many doctors, may want to "know more about it" before making a definite decision to buy a Visette for your own practice. *You have that opportunity*, by taking advantage of the Sanborn Company exclusive — and long-practiced — 15-day Trial Plan.

In this way, doctor, you can use a new Visette in your office, on house and hospital calls, wherever you wish a 'cardiogram to be run — just as your practice actually demands. You have two weeks to thoroughly acquaint yourself with every feature of Visette operation and performance — to let the Visette prove itself in actual use. If you like, you can send Sanborn Company a specimen record made on your Visette, should any technical questions arise concering the instrument's use.

Sanborn Company believes this is the *best* way — by *proof in practice* — to convey the true value of the Visette's compactness, complete portability and fine-instrument accuracy of performance. Take the 15 days, doctor — simply address "Inquiry Director, Medical Division" for full details of the No-Obligation Trial Plan.

18 lbs.
TRANSISTORIZED
$625 del.



The Model 51 Viso-Cardiette electrocardiograph — long o familior instrument in heart practices throughout the world — is avoilable as always, for those who prefer a larger, heavier instrument. Price $785 del.

a Major Breakthrough in EDEMA— in HYPERTENSION

'DIURIL'

(CHLOROTHIAZIDE)

EDEMA—'DIURIL' is an entirely new, orally effective, nonmercurial diuretic—classed as the most potent and most consistently effective oral agent available—with activity equivalent to that of the parenteral mercurials. It has no known contraindications.

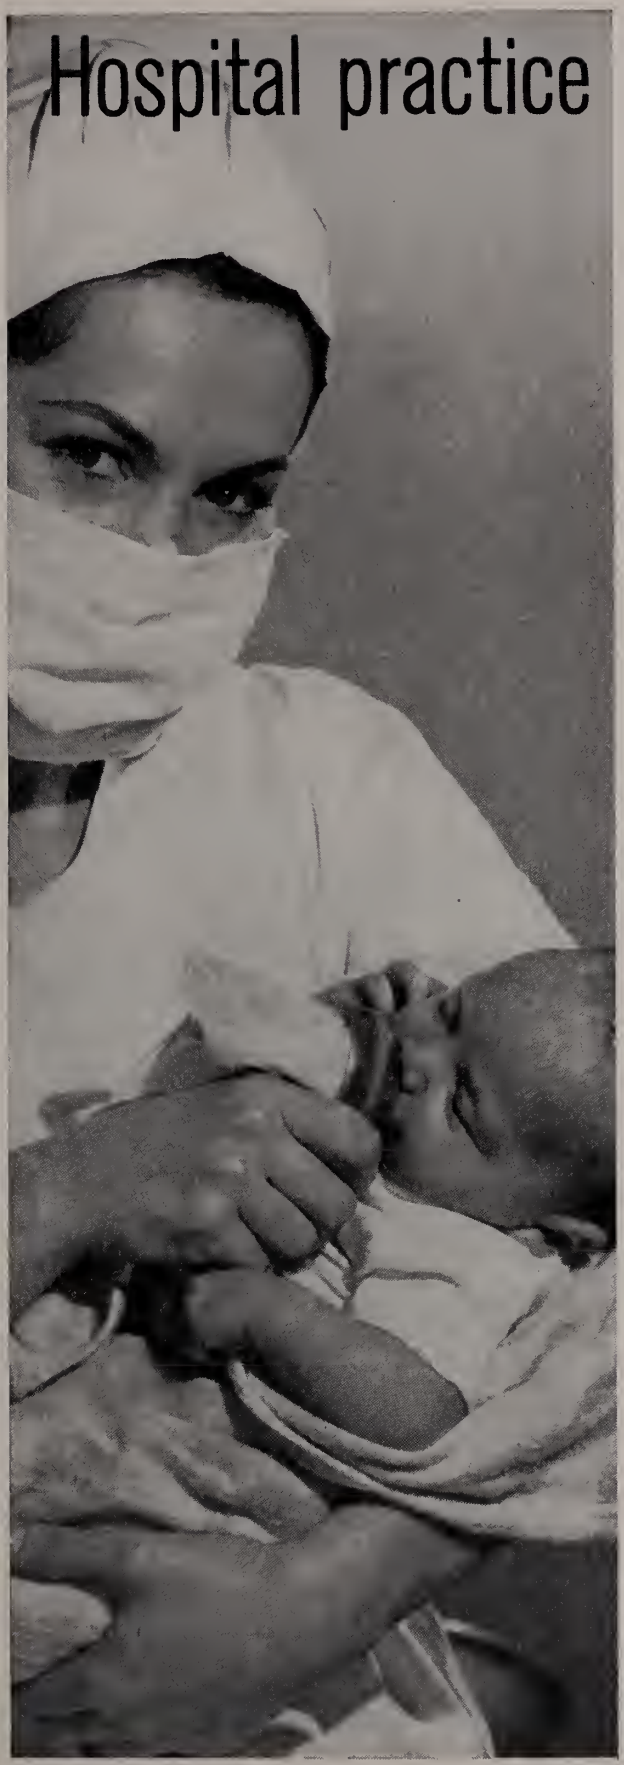
Indications: Any indication for diuresis is an indication for 'DIURIL'.

Dosage: One or two 500 mg. tablets of 'DIURIL' once or twice a day.

HYPERTENSION—'DIURIL' improves and simplifies the management of hypertension: it potentiates the action of antihypertensive agents and often reduces dosage requirements for such agents below the level of distressing side effects.

Indications: Hypertension of any degree of severity.

Dosage: One 250 mg. tablet 'DIURIL' two times daily to one 500 mg. tablet 'DIURIL' three times daily.



Supplied: 250 mg. and 500 mg. scored tablets 'DIURIL' (Chlorothiazide), bottles of 100 and 1,000.

'DIURIL' is a trademark of Merck & Co., Inc.

Hospital practice of infant feeding

Standard formulas for NEWBORNS

Breast feeding is the procedure of choice for the newborn. But it may need to be complemented with standard formulas given here.

The first feeding, 12 hours after birth, consists of a prelacteal solution of 5% Karo Syrup, one or two ounces, repeated at two-hour intervals. Breast feeding is started on the second day for five-minute intervals and the prelacteal feeding continued immediately thereafter and between nursings.

Formula feeding is given on the second day if breast feeding is denied. The small infant prefers the three-hour schedule and the large infant the four-hour schedule.

The initial formula is a low-caloric milk mixture, gradually increased in concentration over several day intervals according to tolerance. Standard formulas for whole cow's milk or evaporated milk modified with diluted Karo Syrup as shown here, constitute the dietary regimen for well newborns.

First formulas for newborns, concentrated according to tolerance

Evaporated Milk Formulas: 3 oz. q 4h x 6 feedings

	FORMULA I	FORMULA II	FORMULA III
	12.5 cals./oz.	16 cals./oz.	20 cals./oz.
Evap. Milk . .	4 oz.	5 oz.	6 oz.
Water	14 oz.	13 oz.	12 oz.
Karo Syrup . .	1/2 oz.	3/4 oz.	1 oz.

Whole Cow's Milk Formulas: 3 1/2 oz. q 4h x 6 feedings

	FORMULA I	FORMULA II	FORMULA III
	11 cals./oz.	11.5 cals./oz.	13.5 cals./oz.
Whole Milk . .	8 oz.	9 oz.	10 oz.
Water	12 oz.	11 oz.	10 oz.
Karo Syrup . .	1/2 oz.	3/4 oz.	1 oz.

ADVANTAGES OF KARO IN INFANT FEEDING

Composition: Karo is a superior maltose-dextrin mixture because the dextrins are non-fermentable and the maltose is rapidly transformed into dextrose which requires no digestion.

Concentration: Volume for volume Karo furnishes twice as many calories as similar milk modifiers in powdered form.

Purity: Karo is processed at sterilizing temperatures, sealed for complete hygienic protection and devoid of pathogenic organisms.

Low Cost: Karo costs 1/5th as much as expensive milk modifiers and is available at all food stores.

†Ayd, F. J., Jr.: The Treatment of Ambulatory and Hospitalized Psychiatric Patients with Trilafon, presented at Ann. Meet., Am. Psychiat. Assoc., Chicago, Ill., May 13-17, 1957.

Trilafon*

(pronounced Trĭll'-ah-fon) perphenazine

the full-range tranquilizer

EXCEPTIONAL THERAPEUTIC RANGE

. . . dosage range adaptable for tension and anxiety states, ambulatory psychoneurotics, agitated hospitalized psychotics

EXCEPTIONAL POTENCY

- At least five times more potent than earlier phenothiazines

EXCEPTIONAL ANTIEMETIC RANGE

- From the mildest to the severest nausea and vomiting due to many causes

ADEQUATE SAFETY IN RECOMMENDED DOSAGE RANGES

- Jaundice attributable to the drug alone not reported
- Unusual freedom from significant hypotension
- No agranulocytosis observed
- Mental acuity apparently not dulled

TRILAFON—grey tablets of 2 mg. (black seal), 4 mg. (green seal), 8 mg. (blue seal), bottles of 50 and 500; 16 mg. (red seal), for hospital use, bottle of 500.

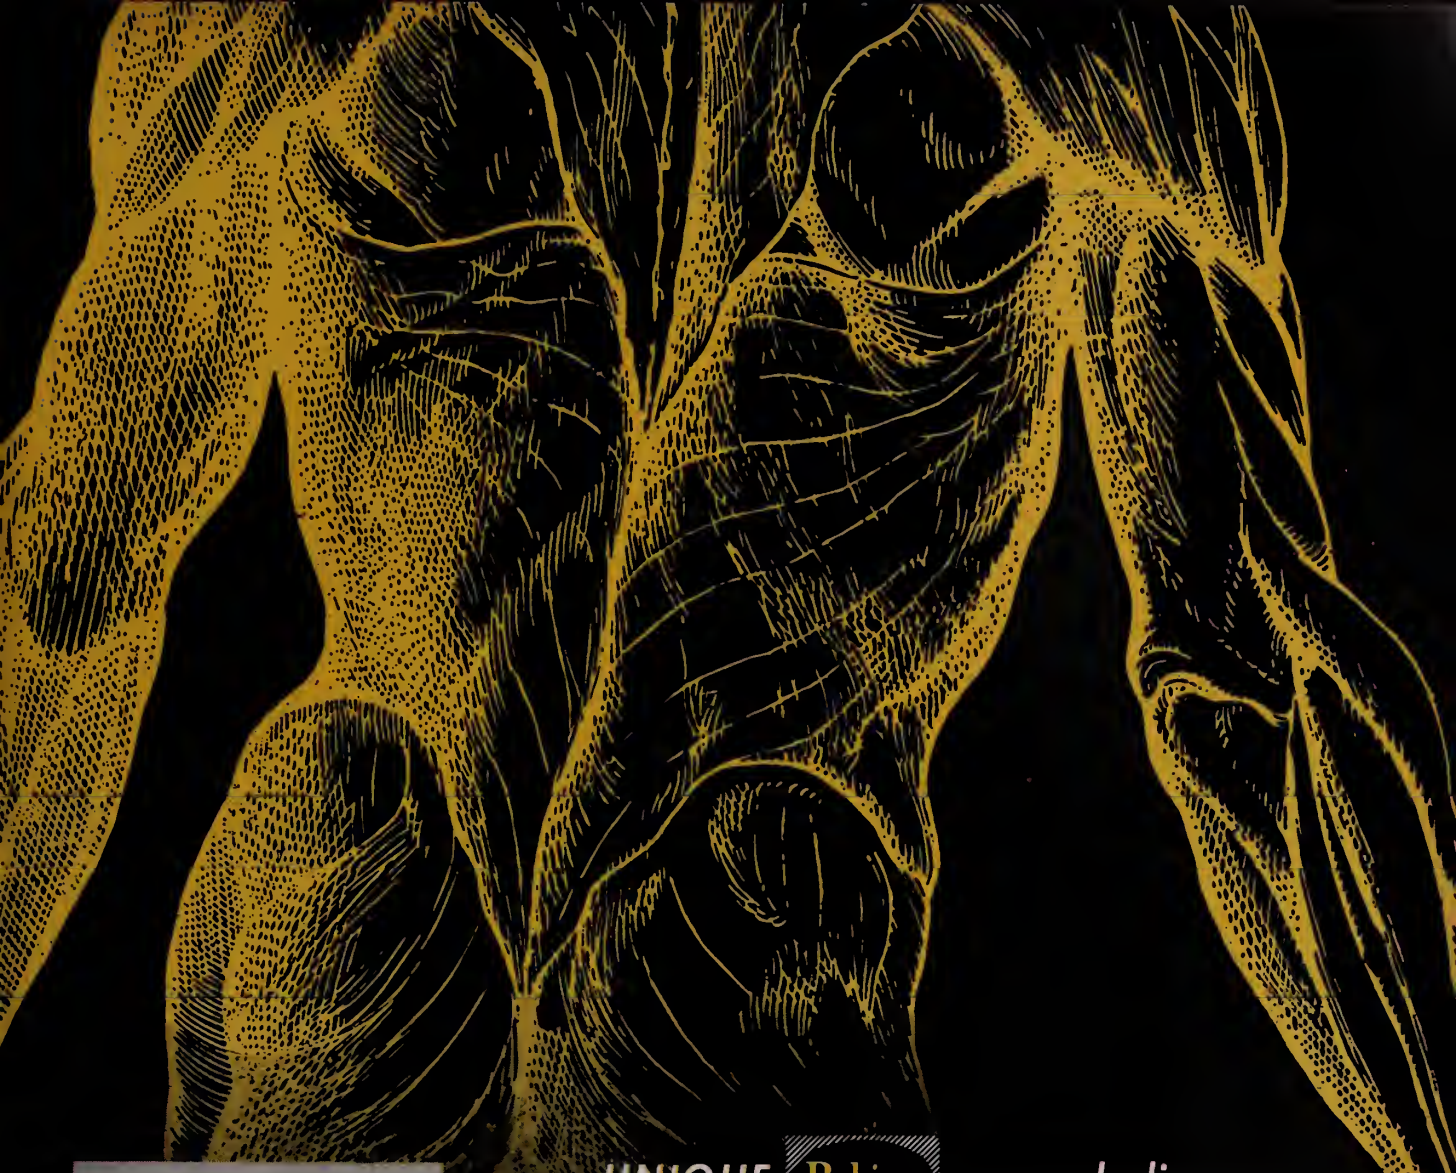
Meat...

and Protein Nutrition in Vascular Disease

Whether the eventual solution of the problem of atherogenesis will come out of the field of dietetics, biophysics, or pharmacology, one fact remains undeniable:

Adequate protein nutrition is considered of importance for the age group most commonly affected by disease of the vascular system, so that the demands of good nutritional health might be met.



Meat is outstanding among protein foods. It supplies all the essential amino acids, and closely approaches the quantitative proportions needed for biosynthesis of human tissue.

In addition, it is an excellent source of B vitamins, including B_6 and B_{12}, as well as iron, phosphorus, potassium, and magnesium.

When curtailment of fat intake is deemed indicated, meat need not always be denied the patient. Visible fat obviously should not be eaten. But the contained percentage of invisible (interstitial) fat is well within the limits of reasonable fat allowance.

The nutritional statements made in this advertisement have been reviewed by the Council on Foods and Nutrition of the American Medical Association and found consistent with current authoritative medical opinion.

CORRESPONDENCE

Defeat Detroit

Seattle, Washington

EDITOR, NORTHWEST MEDICINE:

It is more desirable to own an old automobile than a new one because it is good business, safer, and more satisfactory.

From the business point of view the old car is more satisfactory because you have a small investment, no taxes, and little insurance. You do not need property damage and liability insurance which are expensive. If you run over a person while driving an old car they get up, look at your old heap and dust themselves off. Then they limp down the street and you never hear from them again. If you are driving a new car and have the misfortune to run over someone, they will sue you for the largest amount of money they can think of.

With an old car the only insurance needed is theft insurance. The thieves know they are better and take them in the ratio of 4 to 1.

With an older car you have no garage rent to pay and thus save from five to twenty dollars a month. You have no bills for washing. The rain washes the mud off each night. New cars cost $3.00 per week for washing. If you do it yourself you catch cold and send for your doctor. He juggles you around for three or four days and then sends you to the hospital. You are there about a week and die. The doctor, the hospital, and the undertaker get your life insurance money and the wife and kids go on relief.

When you buy a new car you advertise the fact that you are prosperous and all your creditors are after you. You are automatically placed on all the sucker lists and everyone from the American Legion to parish priest are out to share your wealth.

When you buy a new car you are probably a victim of the style racket. New cars are styled like women's hats, for a season only, and they should last at least ten years. Some of the things that suckers have fallen for are free wheeling, jumbo tires, adjustable shock absorbers and wrap around bumpers. This year cars are supposed to look like airplanes; next year they will probably wiggle their fins.

When you own an old car your gas and oil bills are lower because you have a lower mileage. There is no temptation to become an exhibitionist and pile up unnecessary mileage.

Old cars are safer than new. Human life is important for without life nothing else matters. Old cars are safer than new because there is no temptation to speed. You know how fast the old boat will go. There is no need to experiment. If you want to see 90, don't look for it on the speedometer. In an old car there is no temptation to race. Nobody expects much of you. You don't have to keep up with the Joneses or try to pass them on a curve. In your old car you know where all the gadgets are. You can concentrate your attention on the road. In the new cars, things happen while you are looking for the controls. Tires and batteries used as factory equipment are generally inferior to those used for replacements. These tires and excessive speed accounts for many of the blow outs and serious accidents to new cars.

Old cars are more satisfactory than new ones because when you are in an old car you are less conspicious. You are less envied and less hated.

Old cars have less pick-up than new, especially where girls are concerned. If you have money to waste on a new car the girls think you are rich. If you are single they will marry you. If you are married they will put you into the divorce court. Double trouble.

After you have driven a car one hundred thousand miles, there comes the pride of achievement. This increases as time goes on, while the pleasure of owning a new car must decrease. An old car gives you a chance to express your personality by using it as a vehicle for mottos and slogans. When your car gets old enough you could put this on the back, "Don't laugh lady, you would look like hell too without your paint." In an old car you get the right-of-way. Crumpled fenders mean nothing to the veteran you are driving, while the smallest scratch would be fatal to one of these new creations. With old cars you can take a dog or your next door neighbor for a ride, and in doing this be sure of the fitness of things. When you are driving your old car you know that you are riding. There is no chance that you will think you are home on the davenport and wake up in the hospital or playing a harp.

Pride Goes Before Destruction

A Fable

The other day as I was sorting out some letters that had been stuffed into an old shoe-box, I found an old letter which announced the establishment of a new non-profit foundation, "the only medical research foundation in existence" for the study of Tay-Sachs disease. The shoe-box had been put in the basement of our new building when we were forced to move from our old offices when the Federal Freeway 88 was built. Many of you, I am sure, do not remember when this freeway was built or even recall what a shoe-box looked like. So many changes have occurred. Now that I am very old and not long for this world, some of you may forgive and others understand my reminiscences and garrulities.

At the time when the federal super highways were being built, there were in this country, then known as Euphoria,[1] many non-profit research foundations, perhaps as numerous as the leaves on the great elm tree that stood in the middle of Capitol Park.

How did this come about? Well, you can trace the origin of these foundations far into ancient times, as far as you can trace the origin of money. Indeed, you may not have thought of it but the use of money has revealed, in my opinion, more clearly than anything else, the ingenuity, versatility and adaptability of man. I am one who thinks that money is good and that the discovery of this device should be placed among man's greatest achievements. It makes my old blood boil to hear the Biblical quotation, "the love of money is a root of all kinds of evil" distorted into the statement, "money is the root of all evil." It is sad to reflect that those who inveigh against money are the very recipients of its beneficences and would not be able to speak freely on money or any other matter, had it not been for the invention of money.

Permit me to remind you that in early stages of civilization there were only two ways of inducing your fellowmen to do things for you: the instillation of fear in them at your displeasure and making them like you so they would do your bidding—that is, fear and love. Then came barter, a most cumbersome and limited method. Finally came the device of almost universal acceptance—money. And thus there were three ways of obtaining personal service and freedom of action: the use of fear, of love and of money. Of the three, I am sure you will admit, that during historic times, money has had the widest and most applicable use, even to the point of taking over some of the uses of the other two. Imagine the folly of exchanging it for coupons and chits of limited applicability as was done by large groups in Euphoria when they were nego-

1. Editorial, Life, December 16, 1957.

tiating for what they called "fringe benefits." One of these groups, the IBT . . . but I digress. As I was saying, fear, love and money shaped our early social structures. Skillful manipulators of these powerful forces appeared from time to time and profoundly affected their contemporaries and succeeding generations. Systems of societies sprang up which manifested these forces in varying proportions and combinations.

The subsequent course of development of these societies differed in time and place. This variation was attributed often to the location of mountains, rivers, mines, wheat lands and to rainfall. But most serious students of history ascribed these variations to restless urge to activity in the members of the various social groups.

Euphoria was not always a State of Wellbeing. It started as a colony on a newly discovered continent. The colonists came from many countries with diverse social systems. But they had fairly clear ideas about what they considered the necessary conditions for their wellbeing. They felt they had certain inalienable rights as individuals and that the main function of government was the safeguarding of these rights. They did not dwell much upon their own responsibilities; they had had enough of that, at least those who had lived under kings with divine rights. The colonists set up a somewhat novel form of government in which fear was not to be used to make anyone do another's bidding. They were to be free and the government was to derive its power only from the consent of the governed. How this consent came to be obtained is another story which I will only briefly touch upon later. They prospered. They worked hard and enjoyed the fruits of their labors. They fought for their ideals not only against outsiders but also among themselves. Their form of government prevailed and the nation became a world power and champion, so they thought, of the rights of the individual. They tilled fields, worked mines, herded cattle, built cities with skyscrapers, churches, hospitals, schools and universities, all without aid from their government.

But some of their more energetic and astute citizens tended to gain power which threatened to take away from others their inalienable rights. A vast system of controls and regulations had to be set up. Because of Euphoria's status as a world power, a large military force had to be maintained. You will recall that on several occasions, certain citizens of other countries misbehaved woefully and the Euphorians had to help to straighten things out. Some of these expeditions were skirmishes and police actions but others were veritable holocausts. The Euphorians also had many internal difficulties including what they called "depressions," connected with some malfunction in their monetary institutions, all of which I could never fully understand. Many of the Euphorians, perhaps influenced by ideas derived from philosophies foreign to those of the founders, had long believed that "free enterprise," as the economic system was called, could not do the needed big jobs quickly enough or even at all. Roads and dams had to be built, depressions guarded against and farmers subsidized. So it was that the short step from the concept that the purpose of government was to safeguard the freedom of the individual, to the concept that the purpose of government was to help the individual, was taken. This brought on ever widening spheres of governmental activity, which hitherto had rested in the hands of private citizens.

These many activities of the government posed quite a problem in finance. Many clever methods of taxation were devised. Many were so complex and obscure that most of the taxpayers did not know where the government got its money. Some even thought that the government itself made it—an error easily accounted for by the general lack of mathematic knowledge. (This may not have been an entirely erroneous viewpoint for it seems that the value of the monetary unit could be manipulated to the advantage of the government.) The government was usually short on cash but the humanitarian purpose of the government justified deficits, although the early Euphorians abhorred debts.

Although the Euphorians delighted in stating that they were created equal, it was clear that the cost of government could not be borne equally by the citizens. How to apportion the cost was a very difficult problem. The lawmakers finally hit upon a sovereign idea, a neat trick which some one had heard about in a foreign country, that of taxing the citizens' incomes in accordance with a graduated percentage scale which could be altered by the lawmakers. These "adjustments" followed maneuvers which they facetiously referred to as "logrolling." "Pork barrels" were also much discussed. This did not remove, it seems, the deficit but it did increase the government's income. The taxpayers, the majority of them, now thought that most

of the money derived from this percentage method was not coming from themselves but rather from those who could be deprived of their money harmlessly, legally and morally justifiably.

They elected their congressmen, senators and presidents in ways which seem somewhat ludicrous to us now. They gathered in large numbers at certain designated intervals of time. I vaguely remember some of these gatherings. I believe they were held in great convention halls.

There is one reference to a "cow palace" as a meeting place. I do not know the significance of this but I do know that the farmers wielded great political influence. There was much noise-making and shouting at these conventions. A period of several months followed during which many speeches were made and many exhortations were given. The constitution of Euphoria was recited often in full but more frequently in part when certain sections of the constitution seemed to apply. (Other historic documents were freely cited.) Much of this activity did not seem to interest a large number of he Euphorians. They had heard all of it so often.

One thing, however, was important in this connection. Each of the majority of the Euphorian voters thought of himself as a "common man." Although I have given this term much study I am still unable to formulate in my mind just what this term meant. But the politicians of those days certainly used it effectively. It seems that since the voter thought that public moneys did not come from himself but from the other fellow, all that a politician had to do to become elected was to promise louder and more often than other candidates that he was for spending more and more money for the good of the "common man."

It was recognized by the framers of the income tax laws that each taxpayer had certain responsibilities which should be given cognizance before the percentage scale was applied —his responsibility for support of his spouse, children and indigent parents not on public assistance, and for the cost of operating his business. It was also decided that exemptions should be given for financial contributions to undisputably socially important organizations and institutions, such as churches, universities, foundations and other organizations for social betterment.

These tax laws became so complex that a large class of mathematic experts appeared who could advise the taxpayers of their legal rights and tax advantages in spending money for their business, their employees and for various other items of exemptions. Some taxpayers discovered that they could save money by taking a vacation. This system of exemptions and graduated percentage scale of taxation not only oriented the taxpayer in the approved social direction but also gave him a choice in spending his money. In fact, he could not save it; he had to pay it in taxes, donations, or extravagant business expenses. But if he preferred to give it to non-governmental research institutions instead of to the institutions at Bethesda, he could do so and feel that he was a free and public spirited citizen.

The citizens of Euphoria had always been of a generous disposition. They had given freely of their energies and money for many endeavors from an inner sense of values. Neither their government nor their fellows were fully aware of the good deeds of many of them. Some founded memorial foundations which exist to this day. Then came organizers, public relation experts, quotas, slogans and drives supported by means of mass exhortations by newspapers, radios and screens. The inner sense of values came to be displaced by considerations of tax saving or tax diversion and by compulsion from public opinion.

And so it was that a great profusion of "non-profit" foundations arose. Every chronic human ailment had its foundation, including, by extension, birth and senescence.

But I must not forget an important element in the era of the Euphorians—the Scythians. They were a disturbing lot. They did not believe in the paramount rights of the individual citizen. They worked hard, too, under a rigid system employing the power of fear—successfully I might add. The Euphorians and the Scythians were drawn into race for military control of the world, the like of which had never been known before.

The Scythians put a number of moons in the sky. The Euphorians were frightened. The Scythians had many scientists, particularly mathematicians and physicists—many more than the Euphorians. The Euphorians were informed by their intelligence agents that the Scythians seemed to have appalling command of the forces of nature which could have come about only by the acquisition of new knowledge.

The Euphorians had been long engaged in the pursuit of their happiness. Their mass education

had gradually emphasized more and more the subjects which fitted their youth for earning a living and enjoying life. Even the process of learning had to be enjoyable. If a student did not acquire the little knowledge which was put before him, little concern was felt, for the student was young only once and his happy outlook on life should not be distorted by demands that might frustrate him. Intellectual disciplines which required stepwise acquisition of facts and ideas such as mathematics and physics were generally avoided because these demanded attention on the students' part which was hard for them to give when there were so many pleasant distractions.

Only a few of the Euphorians were engaged in the effort of acquiring knowledge and understanding of the nature of the external world. Yet I must say that large number of Euphorians had some interest in the activities of the few. They were often impatient with the slow progress of science in many fields, especially in the medical field. This, of course, was natural. For many of the diseases of those days seriously interfered with their happiness. The Euphorians had little understanding of the problems but had the naive idea that the availability of large sums of money was the most important factor in their solution. Had not polio fled when the dimes marched?

But what of the Scythian moons? Had too many of the few Euphorian scientists been too busy with the leaves and branches of knowledge instead of the trunk? Had the Scythians a deeper insight into nature because many more of them were interested in basic knowledge? As the Euphorians watched the silvery Scythian moon slip by overhead, many of them asked themselves, must they earn a good living and try to understand the world also?

It was clearly too late for some of them to understand the world but perhaps their children could. And while their children were growing up and learning, they would urge more of their scientists to turn their attention to more fundamental problems than had been previously done in the days of the profusion of foundations.

The race between the Euphorians and Scythians brought to the mind of many of the Euphorians an ancient story[2] about a mule (the Euphorians had a few of these at one time in their armies). A mule, who had not been working hard and who was getting fat and soft idling around the field, fancied himself a runner. "Why, I guess I can run with the best of them," he said. "My father was a famous race horse." When his master needed him to get somewhere in a hurry, he was driven hard and became badly winded. Gasping for breath, the mule said, "I guess my father was not a race horse, but only a jackass."

Pride goes before destruction and a haughty spirit before a fall. It is not good for a man to be without knowledge and he who makes haste with his feet misses his way.

I do not remember now. I do not believe I ever published the announcement of the National Tay-Sachs Foundation, Inc. The Scythian moons and the Federal Freeway 88 came along about the same time.

Hypnosis

Hypnosis, or at least the basic principle of hypnosis, has been used many times by every physician who has ever practiced medicine. Sometimes it has been used deliberately but more often, unwittingly. Sometimes the results have been good, sometimes disastrous. The principle applies, not only to fully induced hypnotic trance, but to every suggestion made

to the patient. Suggestions may be positive or negative. They may be verbal or they may be transmitted quite readily by gesture, vocal tone, or facial expression.

It is possible to use the power of suggestion as a positive, healing force. Those physicians who possess great skill in the art of medicine know how to use it, whether or not they recognize its relationship to hypnosis. It would seem wise to understand hypnosis and to employ its principle usefully rather than to permit inadvertent negative suggestion to cause damage through ignorance. Furtherance of this understanding is the purpose of the article by Cheek in this issue and one by LeCron to be published next month.

Hypnosis does not lend itself to scienitfic verification. At least not yet. This fact undoubtedly accounts for much of the skepticism about its usefulness or even its reality. Effects of hypnosis are not always reproduceable. They vary from person to person and even from day to day in the same person. This is cause for immediate rejection by the physician wholly oriented to scientific medicine.

Cause for variability in action has not been explained adequately but the answer may lie in the nature of hypnosis itself as a function of the human mind. Although it may involve primitive structure and function, there is little doubt that it is influenced materially by accumulated experience. Thus scientific verification would require duplication of enormously complex patterns, a task obviously impossible at present.

Other avenues of acceptance are open to those who understand the art of medicine. As Cheek suggests, they use the principle of hypnosis in disguised forms. Those less adroit in employment of this tool may accuse their more proficient fellows of being good salesmen, thereby admitting envy of the larger practice enjoyed by the more skillful practitioner.

It would be better for both to study the phenomenon long enough to understand its positive value. Technique is not difficult and may be learned readily by any physician but actual induction of hypnosis may have relatively small place in medical practice. Understanding of the principle on which it is based is a great deal more important. Much benefit may accrue to the patient if the principle is used intelligently and much harm can follow if it is used negatively through ignorance. Study of hypnosis should be of benefit to any physician whose practice involves treatment of patients.

The Library

A play in one act

Scene 1. Dressing room, Median County General Hospital, clock pointing to 11:00 A.M., floor littered with discarded O R clothing overflowing from hamper, dirty cups on stand under empty coffee urn, row of lockers, some open and some with locks missing, shelves of garments in considerable disarray. Two surgeons in process of changing to street clothes.

DR. GARRITILL [*untying shoe covers*]. You should have seen the tough gall bladder I had this morning. Took me an hour to dissect a mess of adhesions and then I had trouble telling where the cystic duct entered. Almost got the common duct too. Then the artery got loose and I had to make a blind grab. Got it the first time though. Only break I had all morning.

DR. MOUNDO [*partially dressed in street clothes, combing hair*]. Yea, they sure can be tough. Maybe we'll have it easier if Jobenson's technique works out.

DR. G. What's that?

DR. M. Didn't you see it in the last issue of *Mundo Surgicale?*

DR. G. No, I don't take it. Lord knows I get

so much stuff from the drug houses now, I don't have room on my desk for anything more.

DR. M. I don't take it either. I saw the article when I was in the Library the other day.

DR. G. The Library! I'm fed up with that business. Paid my medical society dues yesterday. Twenty bucks for the cotton pickin' Library. We ought to turn it over to the state and let somebody else pay for it—that is, if anybody wants it.

DR. M. Now wait a minute, Bill. You don't look quite that stupid. Haven't you even been inside the Library lately?

DR. G. No, I just don't have the time.

DR. M. Yea, I know you're pretty busy right *now,* but what are you going to do when you get out of date?

DR. G. What do you mean, out of date? I took a long residency in surgery—I'm well trained.

DR. M. Sure Bill, but new stuff comes along all the time, like that Jobenson technique. You're riding the crest right now but can you keep up with the new men just coming out of training if you don't keep reading? They know what the new ideas are but do you? Competition's getting tougher every year you know. New ideas and new research reports come faster than they used to.

DR. G. You might have a point there, Jack. Makes me think, what was that procedure young Roba had scheduled yesterday?

DR. M. I saw that schedule on the board too. Asked Roba about it. Seems it was something new on arteriovenous aneurisms, developed by Swendholm in Oslo. It was published about a year ago. I've asked the librarian to get it out for me this afternoon.

DR. G. Let me know what it is, will you?

DR. M. Sure will. But there is something else I wanted to ask you. Ever do any research? You've done a lot of colon surgery. Why don't you make a study of some of your cases and report your findings.

DR. G. Always wanted to do something like that but I never seem to have time.

DR. M. Yea, I know how it is, you *are* busy *now.* [*He puts on coat and moves toward the door.*] Well, I'll be seeing you. I have a couple of calls to make before I go to the Library.

Scene 2. The next day, Median County Medical Society Library, carpet on floor, acoustical ceiling, comfortable chair and lamp near shelf marked New Books, table with reading lamps, racks with recent medical journals, reference volumes on shelves. The librarian, seated at a desk, looks up as the door opens.

MISS MASTERS. Good morning, Sir. I'm Miss Masters. May I get something for you?

DR. GARRITILL [*somewhat startled*]. Well —yes—I'm Dr. Garritill—

MISS M. Oh yes. Dr. Moundo said that you'd be in. I have the article you want right here [*picking up a journal from her desk*]. You'll find the article on page 366 in this number. Would you like to use the table over there by the window?

DR. G. Thanks.

[*He sits at the table, puts on a pair of reading glasses, starts to read. Stops, looks around the room briefly, his eyes coming to rest on the shelf of new books.*]

DR. G. [*to himself*]. Said I'd be in did he? Now how do you like that? I guess he's a little sharper than I thought. That remark about my being busy *now* did sort of set me thinking. This looks like a pretty good setup. Guess I could find a few hours each week. Wouldn't admit it to Jack Moundo but I think I would really enjoy doing a little reading here. H-m, wonder what that new book on jaundice has to say.

[*He resumes reading. Just as he has finished the article and is ready to lay the journal on the table, the librarian approaches, a number of books and journals in her arms, each with a protruding slip of paper.*]

MISS M. Dr. Moundo said that you had been wanting to look up some material on diverticu-

litis. I have a few things here that you might like to see and will have a longer list of articles for you to look over the next time you are in. Would you like to work on these here or would you prefer a cubicle where you may keep these on the shelf while doing your preliminary reading?

[*He stares at her for a moment.*]

DR. G. Uh—thanks. Thanks very much. You *are* thoughtful. I think I'll use the cubicle. Looks like I'll be coming in once in a while.

[*She crosses to a side door, books and journals still in her arms. He follows, somewhat slowly.*]

DR. G. [*to himself*]. Guess there's a little more to this than I thought. Wonder why I didn't tumble before? But what beats me is the way that scoundrel Jack Moundo figured a way to jar me out of the rut. I wonder how many more of the fellows in the Society have been ignoring what they can get here? This is going to be real fun to do some reading again. Come to think of it, there must be an awful lot of good stuff here—whole record of medical progress, right on these shelves. Wonder how many times people have made mistakes they didn't have to make or thought they had a new idea which wasn't so new after all? Could've checked right here and been sure about it.

Scene 3. Front entrance, Median County General Hospital, the next day. Dr. Moundo is just entering, Dr. Garritill approaches from the parking lot.

DR. G. Hey, Jack. You scoundrel. I'll have to hand it to you. I got acquainted with the Library and the librarian yesterday. I'll have to admit, you woke me up. How did you figure it?

DR. M. Sure, Bill. I'm glad it worked. You're just like the rest of us—think we're too busy to keep on studying. First thing you know, we've slipped. I was pretty sure you would keep on using the Library if you would just get inside the place once and see how much satisfaction you can get out of it. How was the article on aneurism repair?

DR. G. Nice contribution.

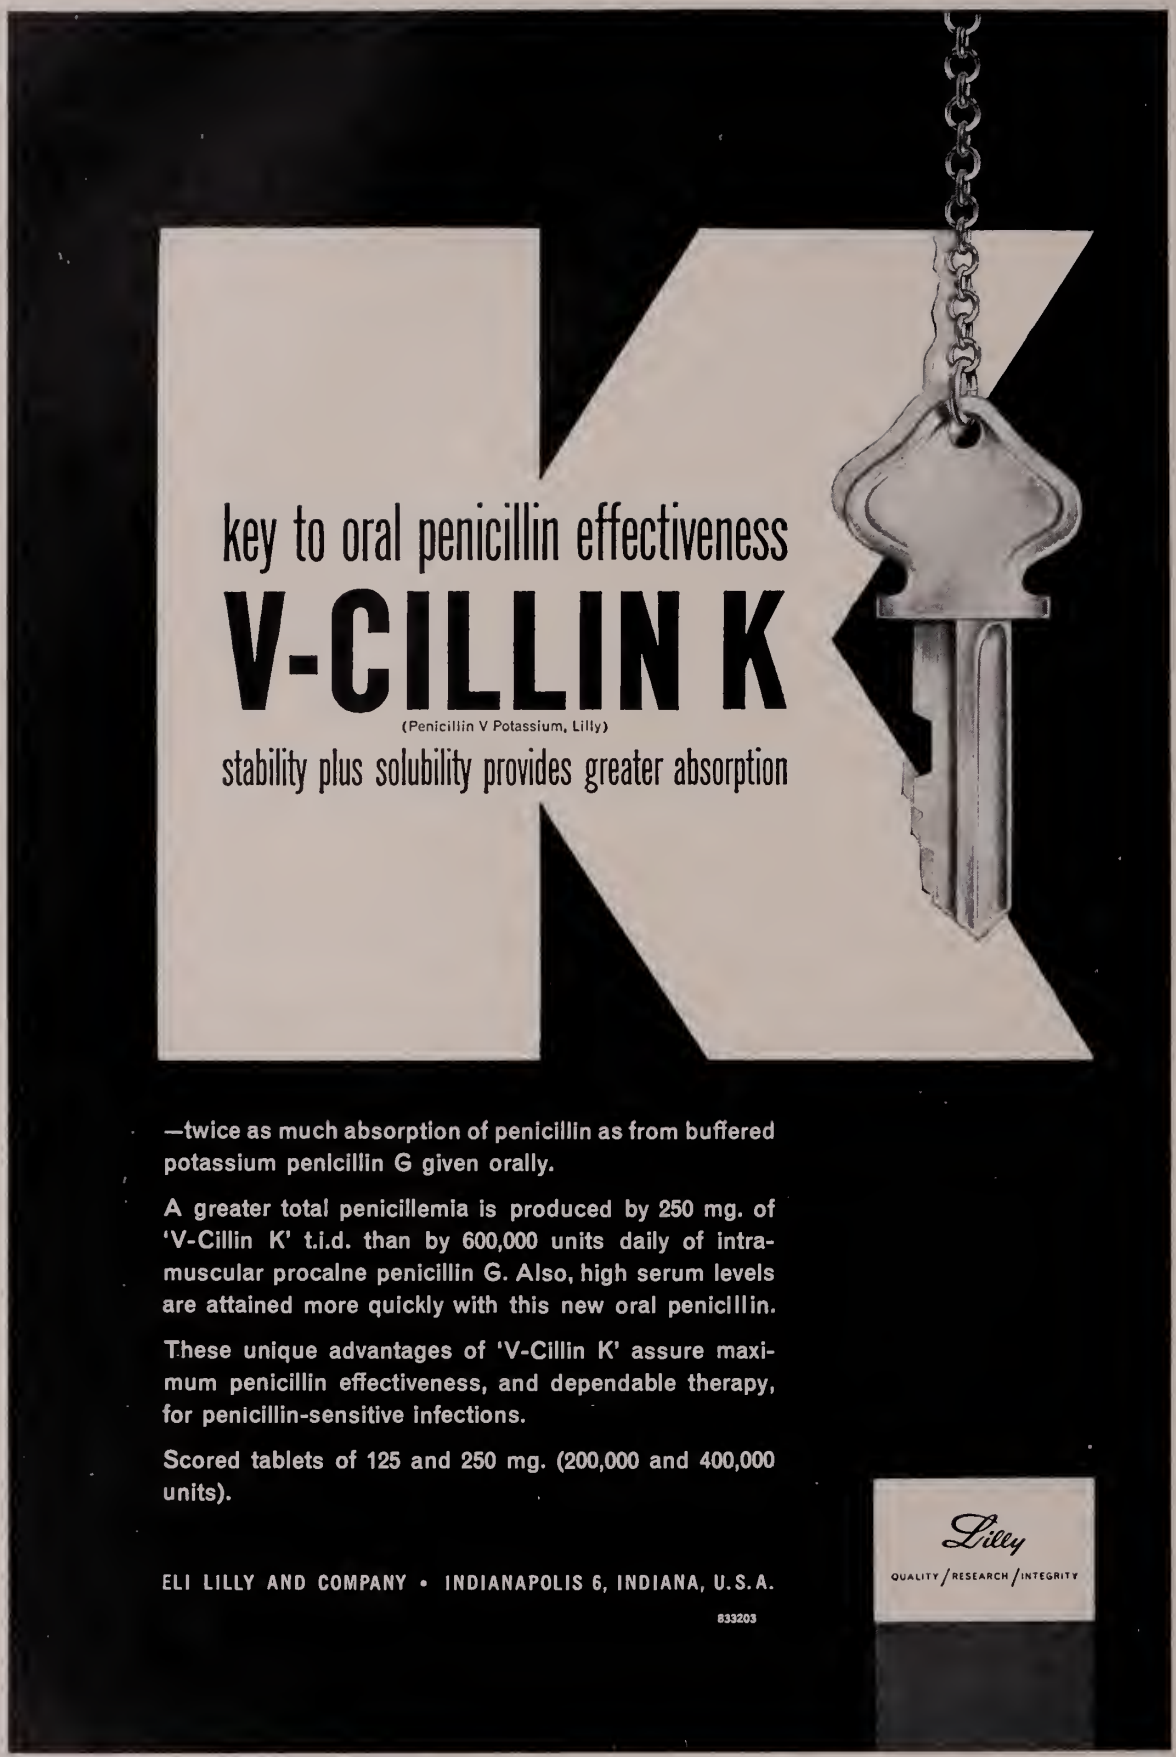
DR. M. Sure, you find things like that pretty often these days. Ever stop to think what the Library does for this town, Bill?

DR. G. No, guess I haven't.

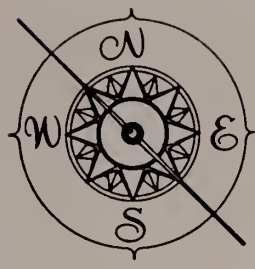
DR. M. In a way, it's kind of a guarantee to the people of this community that fellows like you and me will keep on giving them good service. Somebody once said the practice of medicine is a life-long experience in continuing education. How could we get along without a good Library?

DR. G. Never quite thought of it that way but maybe you're right.

DR. M. I'm sure I am, Bill, and I know you're going to enjoy using it now that you've established the habit.



DR. G. Thanks, Jack. Maybe you've done me more good than you realized.



DR. M. It's OK, Bill—but I guess I'll have to make a bit of a confession. You're not the only one I've been working on lately. I'm just trying to help out a good movement by the National Book Committee. They're sponsoring National Library Week next month, week of March 16-22 to be exact. It's a good time for us to take a close look at what our own Library does for us.

DR. G. Well, I've looked, thanks to you. It's a good Library and I hope we can get more of the fellows to use it.

DR. M. We can and we will.

[*They enter the hospital and walk down the corridor as the curtain falls.*]

key to oral penicillin effectiveness
V-CILLIN K
(Penicillin V Potassium, Lilly)
stability plus solubility provides greater absorption
—twice as much absorption of penicillin as from buffered potassium penicillin G given orally.
A greater total penicillemia is produced by 250 mg. of 'V-Cillin K' t.i.d. than by 600,000 units daily of intramuscular procaine penicillin G. Also, high serum levels are attained more quickly with this new oral penicillin.
These unique advantages of 'V-Cillin K' assure maximum penicillin effectiveness, and dependable therapy, for penicillin-sensitive infections.
Scored tablets of 125 and 250 mg. (200,000 and 400,000 units).

Cancer of the Breast

Choice of Treatment with Special Reference to Surgical Treatment

SIR STANFORD CADE, K.B.E., C.B.
LONDON, ENGLAND

Breast cancer presents itself in a variety of stages and types. No single remedy is applicable to all cases. The earlier the clinical state, the greater benefit from radical surgery. The importance of accurate staging of the disease is emphasized. The more advanced cases are not likely to benefit from surgery and should be submitted to radiotherapy. Palliative treatment by radiation is applicable to the majority of cases. In disseminated cases hormonal control is the method of choice.

Cancer of the breast is the commonest malignant tumour in women. It accounts for 20 per cent of deaths from cancer in women; the incidence in men is 1 per cent of all cases of breast cancer. Throughout the past half century the incidence has steadily increased and this increase is not an apparent one due mainly to better diagnosis or certification, but is a real increase in incidence. Treatment has resulted in a prolongation of life in the majority of patients, but the number of 5 and 10 year survivals has not improved except in selected groups of cases.

A review of the situation shows three important landmarks in the treatment of mammary cancer. The first is the adoption by most surgeons of the teaching of Halsted, the great American surgeon whose name is associated with the so-called radical mastectomy. The second landmark is the advent of radiotherapy and its importance as a palliative treatment which is now generally recognised. The third landmark is the understanding of the hormonal influences on breast cancer. Halsted has opened the portals of surgery; radiotherapy has extended the therapeutic field to the inoperable group, and hormonal control has given a method of treating disseminated breast cancer previously untreatable.

Side by side with these technical developments there has been a clearer conception of the clinical and pathologic varieties of the disease, a better appreciation of the limitations of the various forms of treatment and a more critical assessment of the results obtained.

A better understanding of breast cancer as a clinical entity is based on an accurate assessment of physical signs, on the study of the various histologic types and on the appreciation of the patient's physiologic state.

Clinical Varieties of Breast Cancer

There are six varieties of mammary cancers: 1) The scirrhous, 2) encephaloid, 3) the acute inflammatory, 4) the duct carcinoma, 5) the atrophic scirrhous and 6) Paget's disease of the nipple.

Sommer Memorial Lecture presented at the 83rd Annual Session of Oregon State Medical Society, Portland, Oregon, on October 3, 1957.

Fig. 1. Age 50 years. Stage I carcinoma of left breast. Small hard tumor palpable in upper and outer quadrant of breast. No other abnormal physical sign.

The commonest type is the scirrhous carcinoma, characterised by its hardness, its insiduous onset, its painlessness and its slow rate of growth. The presenting symptom is the discovery of a lump in the breast. There need be no other clinical sign. Adherence to skin, dimpling of the skin over the tumour, nipple retraction and presence of enlarged axillary lymph nodes are the signs of advanced disease. They should not be awaited to make a diagnosis and their absence is not an indication that the breast tumour is benign.

The encephaloid type presents as a soft, rapidly growing tumour with obvious increased vascularity such as venous engorgement. It occurs as a rule in pre-menopausal women.

The acute inflammatory carcinoma is rare, about 1 or 2 per cent of all breast cancer. It is seen more frequently during lactation or pregnancy, but also occurs in the non-lactating breast. The whole breast is enlarged; the tumour is ill-defined; there is always oedema of the skin and some discolouration from pink to purple. Lymph node enlargement is early.

Duct carcinoma presents frequently by bleeding from the nipple. A small tumour may be palpable in the region of the areola.

The atrophic scirrhous occurs in the old patient. It is characterised by intense fibrosis of the breast which shrinks slowly and may be entirely destroyed. Ulceration of the skin is common. The rate of growth is very slow.

In Paget's disease of the nipple, no lump may be detectable in the breast on clinical examination, but the nipple and the areola present a red, eczematous area, which oozes serum and forms crusts.

Histologic Varieties of Breast Cancer

The common variety, the *scirrhous* carcinoma is composed of strands and cords of epithelial tumour cells surrounded by a stroma of fibrous tissue. The other important histologic varieties are: the *medullary cancer*, composed of a conglomeration of round ephithelial cells in a delicate and scanty connective tissue stroma; the *adeno-carcinoma*, where the tumour cells attempt to reproduce ducts and acini of the normal breast; the *comedo-carcinoma*, or intraduct carcinoma, originating in the wall of the ducts; the *papillary carcinoma* or malignant papilloma.

Besides the subdivision of breast cancer into these various histologic types, grading according to the degree of anaplasia or differentiation is now generally accepted as of prognostic significance. The higher the degree of differentiation, the lesser the incidence of lymph node metastases and better the curability rate. The 5 year survival in this type is 80 per cent. The most malignant variety, the so-called Grade III, showing the least differentiation or the most marked anaplasia is the most lethal and shows only about 25 per cent of 5 year survival.

Diagnosis of Breast Cancer

Early diagnosis is of paramount importance. The only certain method is histologic verification. Biopsy in the case of small tumours should consist of the removal of the whole tumour and some surrounding breast tissue. If facilities for the examination of frozen sections are available, a diagnosis can be made in 5 to 10 minutes after removal of the lump. Histologic verification is all the more important in the early lesions, the small tumours. Needle puncture of breast tumours to exclude the presence of a cyst is not a reliable method and does not give a diagnosis of intracystic tumours. Punch or drill biopsy may provide a correct diagnosis, but a negative result cannot be relied upon to exclude the presence of cancer.

Although theoretically it is of interest to review the various pathologic conditions which may be mistaken for carcinoma—fat necrosis, mastitis and fibroadenoma—in practice the safest course is to excise the tumour for histologic study.

Stage of the Disease

Diagnosis of presence of cancer of the breast should always be followed by a careful assessment of the clinical stage of the disease. Of all factors influencing prognosis—histologic type, grading, age of patient, physiologic state of the breast, length of history or duration of symptoms —the stage of the disease is the most important.

Staging of cancer of the breast, with minor variations, is based on extent of the disease—its spread beyond the corpus mammae to the skin, the lymph nodes, the pectoral fascia or by blood borne metastases. The object of staging is to ascertain if the disease is suitable for surgical treatment or if it is unlikely to be cured by surgery. Most classifications rely on the clinical assessment of the presence or absence of enlarged lymph nodes. Such assessment is subject to a margin of error of an average of 15 per cent. Thus Stage I clinically may prove after operation to be Stage II. Seldom is the reverse found. The best known classification is that of Portman; others have been based upon it with minor variations. It can be summarized as follows:

> Stage I. Tumour of the breast only. No detectable axillary lymph nodes. No skin changes.
>
> Stage II. Tumour of breast. Palpable axillary lymph nodes or minor skin adherence over a small area or both.

Fig. 2. Age 35 years. Stage II carcinoma of left breast. There is elevation of the nipple, seen only when the arms are raised. Palpable lymphnodes in left axilla.

Fig. 3. Age 47 years. Stage III carcinoma of right breast. Retraction and ulceration of nipple. Visible and palpable tumor. Adherence to skin and pectoral fascia. Palpable lymphnodes in axilla.

> Stage III. Tumour of breast. Gross involvement of axillary lymph nodes or oedema of skin, or skin nodules; or supraclavicular lymph nodes.
>
> Stage IV. Evidence of skeletal or visceral metastases.

Choice of method of treatment depends upon stage of the disease. Surgery to the breast seems futile in Stage IV. The results in Stage III have been bad, and more and more surgeons have become more and more reluctant to undertake surgery in Stage III cancer. Operability is not synonymous with curability. And cases which are technically operable may yet be quite inoperable. Haagensen's criteria of operability are now well known and widely followed. He considers the disease categorically inoperable (even when technically operable) when there is extensive oedema of skin, oedema of the arm, satellite nodules or the inflammatory type of breast cancer.

Surgery in such cases hardly ever eradicates the disease; the 5 year survival in this group is on the average of 20 per cent. Many patients in Stage III, specially in the presence of oedema or satellite nodules, are made much worse and not better, not even temporarily, by breast ablation. In such cases radiotherapy is the treatment of choice.

Fig. 4. Age 37 years. Acute inflammatory carcinoma. Rapidly growing soft tumor filling the breast. Categorically inoperable. Surgery however wide is unlikely to control the disease. Suitable for radiotherapy and hormone treatment.

Choice of Method of Treatment

Cancer of the breast is not a simple single pathologic state which requires one method of treatment to control it. The clinical and pathologic variations require different methods of treatment. Experience dictates a policy which can be summarised as follows:

The early, and hence the most favourable, case is controlled by adequate surgery. In Stage I radical surgery has given in the hands of many surgeons an 80 per cent of 5 year survivals. In Stage II surgery is less effective, and the figure for 5 year survivals falls to 30 per cent. The results of surgery in Stage III are so poor that the treatment of choice is not by surgery but by radiation. The previously untreatable Stage IV patients with visceral and skeletal metastases are suitable for hormonal treatment. The choice of treatment is summarised in table 1.

Table 1. Choice of Method of Treatment

Stage I	Radical Surgery
Stage II	Radical Surgery & Radiotherapy
Stage III	Radiotherapy only
Stage IV	Hormones (including Adrenalectomy or Hypophysectomy)

Treatment of Patients in Stage I

The most important landmark in the progress of surgery for cancer of the breast was Halsted's contribution—the radical mastectomy which has, with minor modifications, remained the most effective treatment for early cases for the past 75 years. Its popularity, however, led it to be used in advanced cases where it proved ineffective. As the number of Stage II and III cases even today still outnumber the Stage I cases, the results of surgery analysed statistically proved disappointing. The statistically disappointing figures of survivals coupled with the development of radiotherapy have led to a swing of the pendulum from good surgery to ineffective radiotherapy and back to surgery. The most retrograde step in the history of surgery of cancer of the breast was the attempted return to simple mastectomy boosted up by radiotherapy with conventional x-rays at 250 K.V. All cannons of surgical principles of cancer treatment were broken by deliberate severance of the lymphatic channels between the site of the primary growth and the main regional lymph nodes which, even if invaded, were still deliberately left in the axilla with the hope of their problematical destruction by radiation.

The advent of supervoltage radiotherapy and the better understanding of the importance of staging in the choice of treatment have led back to a saner view, and the practice of simple mastectomy combined with radiotherapy is fortunately on the wane.

Radical mastectomy implies the removal of the breast with adequate skin sacrifice, together with most meticulous clearance of the axillary lymph nodes from the first interspace laterally, the re-

Fig. 5. Age 71 years. Atrophic scirrhous carcinoma left breast. Many years history; slow progress leading to shrinkage of breast. Lymphnodes in left axilla.

moval of both pectoral muscles and a wide area of fascia from the chest wall. The mortality of the operation is negligible (1 to 1.5 per cent); the morbidity is slight, with an occasional moderate degree of oedema of the arm. When skillfully done the range of movement at the shoulder is complete and there is no functional disability. In Stage I cancer of the breast, radical mastectomy has achieved the best results—75 to 80 per cent of 5 year survival. Many patients survived 10, 15, 25 and more years.

There are many developments in technique. The operation can be done entirely with the diathermy needle; skin can be widely sacrificed, and the defect replaced by skin grafting. Extension of the operation to include the internal mammary chain, the supraclavicular glands, or the parasternal part of the chest wall are being tried. These extended procedures increase both the morbidity and the mortality of the operation and it remains to be seen if the end results will justify this.

Treatment of Stage II Cancer

The presence of obviously enlarged axillary lymph nodes, or early and moderate skin involvement at once reduces the 5 year survival rate from 80 to 30 per cent. It is obvious that radical mastectomy in such cases leaves the majority of patients with disease beyond the reach of the anatomic area of the surgical excision. Such cases should still be submitted to operation but the addition of radiotherapy is indicated. Radiation should be directed to the supraclavicular fossa and the internal mammary chain. The lymph channels connecting the right and left internal mammary lymph nodes are numerous, and to be effective both chains should always be irradiated. Modern apparatus, such as the powerful cobalt units containing 1000 to 2000 curies of radioactive cobalt, or supervoltage x-rays in the range of two to four million electron volts, has proved most effective. The advantages of supervoltage radiation are increased depth dose and the possibility of reaching a high tumour dose of 6000 to 8000 r without any or only very slight damage to the skin.

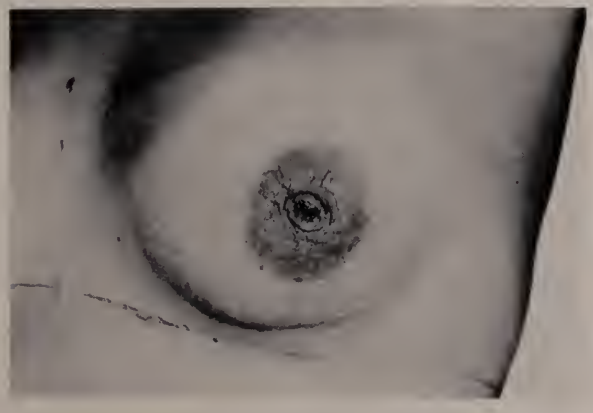

Fig. 6. Age 27 years. Oedema of skin—the so-called "pig-skin" or "peau d'orange." Categorically inoperable.

Fig. 7. Age 40 years. The significance of skin nodules. There is an interval of only six weeks between the two photographs. Even a solitary skin nodule signifies extensive invasion of lymph vessels and is of grave prognostic significance.

Treatment of Patients in Stage III

Stage III cases, specially those with oedema of the skin or satellite nodules, fall in the group of categorically inoperable, according to Haagensen's criteria of operability. For the past 10 years it has been my practice never to operate on such patients. These patients are never "cured" by surgery, the postoperative morbidity is often very great and the incidence of widespread local recurrence is nearly 100 per cent. These patients are suitable for radiotherapy often combined with the administration of hormones. Radiotherapy is of palliative value only. Regression of lesions is obtained in most cases but not total disappearance.

The great advantage of this method of treatment is the relief of symptoms and the clinical inactivity of the tumour often for several years. The achievement of palliative radiotherapy alone or in combination with hormones can be expressed by the word *control*. The patients are alive with disease but with minimum of symptoms and the cancer remains quiescent often for

3 years or more. The palliative effect of skilled radiotherapy in many cases of advanced growths is so satisfactory as to obviate the need of simple mastectomy to relieve the patient from a fungating, bleeding and infected tumour mass. Local healing of such breaking down tumours may be permanent although the disease spreads to the regional lymph nodes, the viscera or the skeleton.

Treatment of Patients in Stage IV

Dissemination of mammary cancer to the skeleton and viscera as well as extensive, often bilateral primary tumours are amenable to treatment by hormones. Both administration and withdrawal of hormones may prove of value. Paradoxically, both androgens and oestrogens—according to the age group—may lead to regression of lesions, afford relief from pain from skeletal metastases and result in regression of lesions. The effect of systemic administration even in hormone-dependent tumours is not lasting. In most patients the disease reactivates after an initial period of inactivity which generally lasts 6 to 12 months.

After such trial or if the patient does not tolerate hormones or is made worse by them, adrenalectomy or hypophysectomy is justified and often indicated.

Two important discoveries have resulted in the clinical adoption of adrenalectomy or hypophysectomy as a practical possibility in the treatment of disseminated breast cancer. Charles Huggins of Chicago was the first to suggest and practice adrenalectomy, having observed the hormone-dependence of some breast and prostatic cancer. The discovery of cortisone permitted the maintenance therapy essential for survival after these procedures. Adrenalectomy has been practiced for the past six or seven years; hypophysectomy for 4 years. Both procedures aim at the abolition of the formation of steroid hormones. In hormone-dependent cases, disseminated lesions regress and for a time—varying from a few months to 4 or 5 years—the disease ceases to progress and the metastases disappear or remain quiescent. There is as yet no accurate method of distinguishing the hormone-dependent from the independent cancers and the result of the operation still remains unpredictable. About 60 per cent of cases are hormone-dependent. Of these about half show complete subjective and considerable objective improvement and the remainder show partial improvement. To date no other form of treatment has achieved so much in the management of the advanced cases.

68, Harley Street (W. 1).

Hypnosis

An Additional Tool in Human Reorientation to Stress

David Bradley Cheek, M.D.
San Francisco, California

Our F.O.B. equipment for meeting the twentieth century stresses of life are in need of improvement, as has been well pointed out by Selye.[1] We have tried to alter the functioning of our obsolete equipment with chemicals and hormones but the results have been disappointing. Our physiologic responses to danger are essentially the same as those evolved by the first vertebrate animals some 450 million years ago. In situations of continued unfavorable environment, lower animals will go into a resting state for individual survival or will reproduce in numbers large enough to ward off species destruction.

Students of paleontology have been interested in factors causing extinction of various animal groups whose adaptations did not keep pace with environmental threats. Paleontologists are seriously concerned over the prospect for Homo sapiens. When he goes into a potentially helpful hibernating-like state in an automobile accident, he is brought out of it as quickly as possible by his alarmed physician. In times of great political confusion and strife his women become less fertile. We have seen a wonderful decline in mortality since 1900 from such diseases as meningitis, pneumonia and tuberculosis but there has been a steady increase in morbidity and mortality from peptic ulcer, malignancy, the collagen diseases and vascular disease. These seem to eventuate more from our feeble adaptations than from the fact that there are more people surviving to an older age than in 1900.

Religion

There is some reason to believe, according to the reports of increasing cigarette sales in 1957, that many members of our species do not appreciably care about the future of Homo sapiens. If, however, we do care, what can we do? Can we turn to religion?

Religious faith can play a very important part in recovery from trauma or acute illness but there is an understandable tendency for the patient with a recurrent or continued illness to believe eventually that his misfortune is the will of God. There is a strong tendency toward assumption that the illness is punishment for some real or imagined misdemeanor.

Insurgency against bad luck is a valuable aid in releasing defense potentials for recovery from serious illness but insurgency may give way to passive submission if the patient with strong religious beliefs has, like Job, experienced nothing but disappointment. The patient with chronic illness needs to know why he may have failed to recover, to know that failure can be reversed, to know that the unfavorable responses so far may have been the result of poor faith in himself rather than expressions of anger from an Almighty. He must be given the tools with which to fight, the means of altering unsatisfactory physiologic mechanisms.

Psychiatry

Our very small army of psychiologists and psychiatrists might help us improve our adaptations to continued stress but limitations of time, money, and the widespread clinical blindness to psychologic factors in illness are serious handicaps in this channel. The men and women equipped to help are not seeing the apparently well-adjusted hypertensive who cannot consciously recognize his conflicts, or the arthritic, the young diabetic, the tuberculosis patient, the respiratory cripple with asthma, emphysema, or bronchiectasis. They are not seeing the woman who disguises her genital fears with menorrhagia or continued vaginitis, the woman who feels in-

Presented at the Hypnosis Symposium, Seattle, Washington, July 19-21, 1957.

adequate as a female because she has hair on her abdomen or thinks her breasts are too small. They are not seeing the great majority of men and women with duodenal ulcer, gall bladder disease, or "colitis." These are just a few of the disturbances for which Homo sapiens needs psychologic help.

He is not getting it from those most qualified to give it. He is not getting it because the greater part of our medical practitioners have not had a chance to learn in what diverse ways the individual reacts to stresses. We have not learned a quick way to evaluate these factors. We have not learned the easy ways of releasing consciously repressed material and we have not learned the art of listening adequately to our patients.

Hypnosis

Hypnosis is not a panacea. There are limitations to its successful use. There are some dangers as there are with any good equipment when poorly used, but hypnosis is a valuable tool not only in assessing psychologic factors in disease but in allowing malfunctioning physiologic processes to be corrected. Its potential in speeding wound healing and releasing life-saving defense mechanisms in the presence of previously overwhelming infection was recognized over 100 years ago by James Esdaile.[2] It has been too much relegated to use for alleviation of pain and too little recognized for its value in building ego strength in the patient, in uncovering fear and in reorganizing physiologic adaptations to environment. The contributions of men like Esdaile, Elliotson, Krafft-Ebing, Wetterstrand, Liebeault, Bernheim, and Coue have largely been ignored until the years following the second World War.

Everyday Hypnosis

Hypnosis has been a nasty word for many people since it was coined by James Braid over 100 years ago. It is time we recognized its value as a symbol of very wonderful and multiphasic force. We as physicians use hypnosis so often in disguised forms that we should advance further to a full knowledge of its mechanisms. Possibly we should teach them to our children who are less rigid and much more responsive to suggestions than are we when we have finished medical school and hospital training. We can see hypnosis in action around us every day. In its superficial form it goes by the name of salesmanship. In its most profound form it may be responsible for the survival of a girl pinned nine days beneath a car in the mountains of Utah.*

Spontaneous Hypnosis

Hypnosis can be induced by trauma or by a great emotional stimulus. In this respect it may be similar to the freezing for camouflage found in lower animals during an emergency. Hypnosis can be induced by lulling through repeated gentle stroking of the skin, as once done by the mesmerists. In this form it may be similar to the effects produced by the nursing mammal in licking its young to quiet them into sleep, or the human mother in caressing her baby.[3]

The focusing of any of the five senses to the exclusion of awareness in the other senses may bring about an hypnotic state. Fascination or focusing of this attention may be exogenous as with the rabbit facing a snake, or the human lulled by soft music. It may be endogenous when a subject daydreams or actively uses recollection of previous peaceful experience. The masculine propensity at breakfast for becoming "lost" in the sporting pages while his wife vainly tries to get a response to a question is an example of spontaneous hypnosis and dissociation.

Incentive

Direct hypnotic suggestions may not be effective in bringing about an hypnotic state. Motivation is very important.[4] Patients may be completely refractory at one time when there is little need but may be able to reach a deep state under different circumstances when the need is great and other means of therapy have failed. Sometimes this need can be expressed by the operator and communicated to the subject, but curiously this often is spontaneously understood and accepted by the subject during a critical illness without any verbal communication of this need by the therapist. Every medical hypnotist has been impressed by this quality of incentive which seems occasionally to work in response either to extrasensory perceptions or increased awareness of minimal cues.

Research Hypnosis

Many research projects using hypnosis to alter physiologic responses in relatively disinterested volunteers have been disappointing because the important factor of incentive has been lacking or the attitude of the investigator has been so

*Jean Margetts, June 24, 1956, in Wasatch Mountains near Salt Lake City.

"scientifically objective" that the subjects have picked up the minimal cues of failure along with the directive suggestions. Research with the physiologic processes of the critically ill under hypnosis has been underexplored. This is the area of greatest potential gain. Physiologic responses of the patient under hypnosis with varying imagined environments can use the patient as his own control. This is a much needed and very fertile area for biochemical exploration.

Law of Reversed Effort

The hypnotic force of pessimistic thoughts is greater than that of optimistic ones. This is a law of human behavior which is responsible for such agonies as postoperative urinary retention, continued enuresis, obesity, compulsive coughing and frigidity. Emile Coue called this force the "law of reversed effort."[1] We fail many times before we succeed with any new experience. The infant falls many times before walking. The flush of achievement soon pales at the realization that everyone is walking even better than he. The psychologic tricks of showing a patient how to circumvent the law of reversed effort belong to the art of hypnosis. Without them we are powerless to help patients with the great majority of psychosomatic illnesses. It is not enough when we tell the woman with the headache that she does not have a brain tumor and that the pain is all nervous. We must give her the tools to combat all her previous unpleasant experiences with the headache. The subconsciously frightened pregnant patient with hyperemesis needs to know that her vomiting has become a habit. She can eat and thoroughly digest a full dinner within an hour of learning that she can alter the physiology of her intestinal tract with recollections of appetizing food. This is not the complete answer, however, for she must also learn that there may be recurrence of nausea at times until she has full confidence in her ability to use her own hypnosis constructively. She needs to know what her fears have been and what conditioning factors were responsible for the continuation of symptoms. She needs to know that previous failures to control the vomiting by will power did not make her an inadequate person or a neurotic.

Rebellion Against Coercion

The child is always being told what to do and not to do. Although there may be outward obedience to these coercions there is invariably an internal rebellion. This force is probably the greatest enemy of the medical hypnotist until he learns humility and respect for the subconscious drives of his patient. We ask for cooperation from the subconscious with our hypnosis and we are much more likely to get it when we ask nicely and offer permission to the subconscious to refuse or alter the responses to a request.

Psychologically constructed as we are in our personal needs for acclaim and gratitude for our therapy we, as physicians, have to struggle hard before we fully recognize that we succeed in direct relation to the amount of confidence the patient has in us. This recognition usually comes slowly through the years. Often we seem to do our utmost to tear down the ego strength of our sick and dependent patients in order that we may improve our own ego strength. Nothing will do more for correcting this mistake than continued experience with a permissive technique in medical hypnosis.

As our experience grows we learn that our "power" as hypnotists is a gift from the responsive patient. This gift should be treated with respect for it can be easily taken away by the patient. We learn that our role is that of a sensitive catalyst activating the subconscious forces within our patients. This is the case with the ordinary practice of medicine also but experience with hypnosis brings the lesson home most convincingly.

The physician who understands the mechanisms of hypnosis has an extra tool at his command. He soon learns to use it sparingly and in appropriate places. He may stand a better chance of doing less harm than good in his work. *He will be protected from that very dangerous form of disguised hypnosis exerted upon him by his grateful patients who may, through the years, convince him that he can do no wrong.* All of us find it much too easy to remember our successful efforts and to forget those unpleasant creatures who have drifted elsewhere for medical help.

Dangers

The dangers of hypnosis have been greatly exaggerated. There are certainly dangers in hypnosis and the writers who state them are scientifically correct while they actively potentiate the dangers by pointing them out. The mechanisms by which hypnosis can do harm are not different from the tools which Lady Macbeth used on her husband, which Cassius used

on the honorable Brutus, which Iago used on Othello or the Governor of a southern state recently used on his people to harm the negroes following directions of our Supreme Court. *We can do more harm with ignorance of hypnosis than we can by intelligently using the forces of suggestion.* Thousands of surgical cripples can attest to that fact.

Self-Knowledge of the Unconscious

Patients will sometimes disturb our peace of mind by telling us why they are ill and what we should do about it. This can be an annoying trait of the neurotic and in the normal awake state can do much to destroy friendly relationships between physicians and patients. When it occurs during or shortly after a patient has been in hypnosis it is wise to make notes of the opinions, to use them profitably and with gratitude, for they are usually correct. This is a strong statement. It can be substantiated.

This curious insight can be evoked at a conscious level by using a Chevreul pendulum with the unhypnotized subject according to the technique of LeCron.[6] It can also be demonstrated with ideomotor reflex finger signals in answer to questions with the subject under hypnosis. Speaking under hypnosis is less reliable than the muscle reflex answers until the patient has been trained to maintain a deep trance while talking.

Teleology

In addition to this psychologic adroitness there is a very wonderful tendency of the subconscious to adapt physiologic processes beneficially. James Esdaile[2] was one of the first medical hypnotists to call attention to this quality. Emile Coue[1] called it the "teleology of the unconscious." Esdaile (1846) found extraordinary fortuitous responses in his East Indian patients when he was using only mesmeric passes without any verbal suggestions. His operative mortality dropped from approximately 50 per cent to 5 per cent due to a decrease in surgical shock and nausea as well as an apparent increase in systemic resistance to infection. His infection mortality rate was not equaled anywhere in the world until after 1866 when Lister demonstrated the importance of sterilizing instruments and dressings and of washing the hands before instead of after surgery.

I have asked for the identical general response of awakening "feeling comfortable, relaxed and rested" from one patient with a sprained swollen ankle and from another patient whose body was covered with blisters and weeping raw areas of poison oak dermatitis. With the first patient the ankle became painless and the edema was gone within 12 hours. The second patient with the poison oak slept a full eight hours that night without scratching. The lesions were healed in 24 hours in spite of her previous experiences with the distress lasting a minimum of 14 days. Esdaile tells of a man who withstood a two hour operation for cancer involving the maxillary bone, the orbit and extending through the palate into the pharynx. The man maintained every position without moving until an accidental trickle of blood ran into his trachea. At this point he leaned forward and coughed to clear his lungs. At no point did he feel pain. We cannot duplicate this type of behavior with surgical anesthesia.

A Method of Probing the Unconscious

A physician attending a symposium on hypnosis volunteered as a subject to experience a method of uncovering the factors responsible for his troublesome gagging when in a dentist chair. The therapist began questioning him with a Chevreul pendulum:

Q. "Does your subconscious know what caused the gagging?"
A. "Yes." (Indicated by the direction of ideomotor swing of the pendulum) see LeCron.[6]
Q. "Did the cause originate before you were 20 years old?" (The physician was 52 at the time of quesioning.)
A. "Yes."
Q. "Was it before you were 10 years old?"
A. "Yes."

At this point the physician put the pendulum down on his lap and with a surprised expression on his face gave in essence the following account:

"Now I remember what it was. When I was a child in Chicago they were worried about me. I was put in an open air school because they thought I might have tuberculosis. Because I was underweight my mother forced me to eat eggnog and extra amounts of milk till I felt constantly stuffed. Then I began having sore throats and they took out my tonsils. I remember that I hemorrhaged after the operation and the house doctor put a hemostat in my throat and left it there all night." The physician closed these re-

marks with an unconscious gesture of his supine hands to indicate that this seemed to be all there was.

A member of the teaching panel asked, "Have you ever thought of this relationship before you came up here to sit down?" The answer was "No." "Then would you please hold up that pendulum again while I ask you another question?"

When the question, "Are you now in hypnosis, doctor?" was asked, the physician looked surprised again and answered verbally, "No, why do you ask?" While he was answering this apparently foolish question the pendulum began wildly swinging in the "Yes" direction indicating his subconscious recognition that he had spontaneously gone into an hypnotic state while concentrating on the movement of the Chevreul pendulum during the early questioning.

This is a beautiful example of the fortuitous behavior of the subconscious when given an opening for analysis of the factors in a complaint. There was no further questioning and no suggestion other than the tacitly implied one of inviting the physician onto the platform for a demonstration of an hypnotic technique aimed at curing an overactive gag reflex. The therapist invited a dentist up to check the results. This had been done when the physician came up to the platform. He had retched when an instrument had been used to depress his tongue. Now after stating the factors spontaneously apparent to him, the tongue blade failed to cause a gag reflex even when the uvula was touched.

In addition to this ability of the unconscious to perform helpfully when given free rein under hypnosis to alter physiologic mechanisms, there is the curious tendency for time distortion and hyperamnesia which can be helpfully used in mental illness. LeCron will ask a patient to go forward a year or two and be calling at his office for a follow-up visit.[7] He will then remark that it has been a long time since the last visit and "would you be good enough to remind me of what happened to help you get well?" The patient will outline in the past tense the self-determined course of therapy which Mr. LeCron can then feed back to him with beneficial results.

It is impossible to do more than outline some of the aspects of hypnosis and its use in medicine here, but there are several broad principles which should be kept in mind. It has been the purpose of this paper to present some of the features of hypnosis which are not commonly discussed in the current lay and scientific publications. The methods of handling specific illnesses will vary with the disease, the patient, and the operator, but the following general outlines of approach and concept may prove helpful to those who elect the addition of hypnosis to other diagnostic and therapeutic tools in the ever increasing complex which constitutes the art of healing.

Definitions and Basic Laws Applying to Medical Hypnosis

1. Superficial suggestion of advertising, good salesmanship, and effective teaching are as related to the deep trance of hypnosis as crawling is to running. The means of induction by vivid use of imagination, repetition, or shocking into undivided attention are the same.

2. The deep hypnotic trance is related to resting states of lower animals in hibernation or "freezing" for camouflage in time of danger. In the deep hypnotic state there is a release of powerful physiologic defense mechanisms which can be of life-saving value in critical illness.

3. Even in light states of hypnosis there is found a curious ability to utilize self-analytic qualities relating to psychosomatic and psychic illness and these may prove curative without the intermediation of the hypnotist in any other way than as a catalyst.

4. A workable hypothesis for medical hypnosis seems to be that it depends for the most part upon use of experience with any of the senses in orienting better to external or internal stresses. This definition does not cover the hypnotic states resulting from lulling stimuli as with mesmeric passes nor does it adequately cover the spontaneous states found with trauma or great emotional shock. These exceptions are rational, however, if we consider them related

to fortuitous reflex behavior of lower animals in time of stress.

5. Motivation is of great importance in modulating success with hypnosis. The greater the need for help, the greater the susceptibility of the patient.

6. The law of reversed effort must be circumvented to help patients use hypnosis successfully and it is wise to develop confidence in altering unimportant reactions before advancing to the treatment of the actual complaint. Often the patient will correct the main complaint after the preliminary demonstrations and before anything has been done directly in the important area. This is better for the ego strength of the patient than being forced to recognize that the therapist had used direct suggestions for cure of the main problem.

Government and Business

More and more people are asking: "Are we overgoverned?" As recently as 1954, total federal, state, and local tax and nontax government receipts came to $89.6 billion. In 1956, the figure reached $107.6 billion. In 1956, our national income stood at $343 billion. Thus, nearly one-third of the national income is channeled through government. We are approximately one-third socialized. If the government sector continues to grow, as it has since 1929, in fifty years 99 per cent of our economy will be socialized and only one person out of 100 will be privately employed. Perhaps no one expects this trend to continue, but there is nothing in sight at the moment that is stopping it!

By Dr. Emerson P. Schmidt in The Freeman, August 1957, Volume 7, p. 4.

Surgery of Major Arterial Aneurysms

THOMAS O. MURPHY, M.D.
TACOMA, WASHINGTON

Risks have been reduced to the point that elective operation for arterial aneurysm offers better prognosis than conservative treatment. Recent improvements offer hope for better results in thoracic aneurysm but mortality remains high in rupture at any site.

Rapid advances of medical science have changed life expectancy of the human race drastically over the past two decades. However, our advances in the most universal disease of all, arteriosclerosis, have been purely palliative in nature, while populace in the age groups concerned has increased many fold. Medical literature as early as the 16th century contained descriptions of advanced peripheral arteriosclerosis, and even prior to this Fallopius[1] described examination of an elderly woman whose arteries had "degenerated into bone." Pathologic description of aneurysmal arterial dilatations was well presented by William Hunter[2] in 1757 and there were some speculations at that early date as to their possible surgical therapy. True surgical intervention was not commonly considered until after attempts of Rudolph Mattis[3] in the late 19th century, and excision of these lesions awaited introduction of arterial replacement techniques, first satisfactorily performed by Gross[4] in 1948.

This report is a discussion of 114 operations for surgical repair of arterial aneurysms performed since 1954.

General Considerations

Prior to discussing specific techniques of surgery, one must discuss the general indications for an attempt to repair a major arterial segment.

In general, arterial aneurysms constitute surgical indication by their presence. The natural history of aneurysms was well discussed by Estes,[5] who showed that 33 per cent had fatal termination within the first year after recognition of the lesion and that only 18 per cent survived a five year period. Expected mortality from other causes in this age group (60 to 70 years) is only 10 per cent over an eight year period.

In this series of 114 aneurysms (table 1) there were 18 ruptured aneurysms operated upon with only 4 survivors.

Table 1. Major Arteriol Aneurysms

Artery	No.	Successful	Foilure	Expired
Carotid	1	1		
Axillary	1	1		
Aortic Arch	2			2
Thoracic Aorta	11	5		6
Abdominal Aorta	46	38	2	6
Aortic Bifurcation	45	34	2	9
Femoral	3	1	1	1
Popliteal	5	4	1	
Total	114	84	6	24

The general cardiovascular-pulmonary status of the patient must be the primary consideration if an arterial aneurysm is to be treated conservatively.

Results

One hundred and fourteen arterial aneurysms (table 1) have been operated upon and repaired in 108 patients between Dec. 31, 1954 and Jan. 1, 1958 (Fig. 1). Six patients had multiple aneurysms. Ages have ranged from 16 years (post-traumatic thoracic aneurysm) to 84 years.

Presenting symptoms (table 2) were varied, but

Table 2. Symptoms Nonruptured Aneurysms

Symptom	Patients	
Total	90	
Palpable Mass	87	(all but thoracic lesions)
Slight Back Pain	25	
Severe Back Pain	4	
Severe Abdominal Pain	9

Claudication	18	

Fig. 1. A typical aneurism of the lumbar aorta between the origin of the renal arteries and the bifurcation.

with the exception of ruptured aneurysms, symptoms were generally mild. Slight back pain was noted by 25 patients, and severe back pain by 4. Vague abdominal discomfort was common (51 patients), and true abdominal pain was noted by 9 individuals. Forty-two individuals had mild pain in the legs and 7 had definite evidence of L-5 nerve root irritation with severe pain and hypesthesia. Eighteen patients had true intermittent claudication of the lower extremities, either from associated peripheral arteriosclerotic occlusions or from distal emboli from the aneurysm. Embolization into the superficial femoral artery from an aortic aneurysm should always be considered in patients in the 50 to 60 year group with sudden onset of leg pain and later claudication. Two patients of this series were in this category. The aortic aneurysm was overlooked initially in each instance.

Eighteen patients had sudden onset of severe abdominal pain, shock, and evidence of hypovolemia with typical ruptured aneurysms. All patients presented pulsating mass, demonstrable radiographically or by physical examination.

Ninety aneurysms were of the abdominal aorta of which 44 required resection of the bifurcation. Thirteen were in the thoracic aorta and 10 were of peripheral vessels. Ninety-five of these aneurysms were operated upon electively. In 18 instances the aneurysm had ruptured, necessitating emergency surgery. There were 14 deaths and only 4 successful repairs in the 18 patients operated upon for ruptured aneurysm. In the 95 cases of elective operation for aneurysm, there were only 10 deaths and 8 of these were in patients with thoracic aneurysms. In 6 cases there was failure of the arterial prosthesis, either due to immediate or late rupture of the graft, or to secondary thrombosis. Five of these patients were again operated upon with four of the secondary attempts being successful in reestablishment of arterial continuity.

Choice of device to be used in arterial replacement depends much upon the materials at hand as well as familiarity of the surgeon with the various agents. Schumacher,[6] Shumway and Lewis,[7] Hufnagel[8] and many others have presented encouraging experimental data using a variety of prosthetic materials.

Fig. 2. Replacement of a lumbar aortic aneurysm (Fig. 1) with an Ivalon arterial porthesis.

Ivalon

Following experimental work initiated by Shumway and Lewis,[7] I have used compressed polyvinyl sponge (Ivalon) as placement after resection of 49 arterial aneurysms (table 3). This

Table 3. Aneurysms Repaired with Compressed Polyvinyl Sponge

Artery	No.	Successful	Failure	Expired
Thoracic Aorta	8	3		5
Abdominal Aorta	22	20		2
Aortic Bifurcation	17	15	1	1
Femoral	2		1	1
Total	49	38	2	9

material is easily fabricated by the surgeon, in the operating room, without special equipment or delay. It is easily sutured and is well tolerated by the body. Bifurcation can be constructed with ease. Its chief advantage is lack of transmural hemorrhage during the early minutes after insertion (Fig. 2).

Compressed polyvinyl prosthesis was used to replace a segment of thoracic aorta in eight instances. Three of these operations were successful. Five patients expired. Thirty-nine abdominal aneurysms were replaced with an Ivalon

Fig. 3. Replacement of a lumbar aortic aneurysm with an arterial homograft. (Note the anterior placement of the lumbar arteries on the homograft, for ease of control.)

Fig. 4. Replacement of an aneurysm of the bifurcation of the aorta with a nylon arterial prosthesis.

prosthesis. Failure occurred in two instances. One bifurcation graft was followed by thrombosis of an iliac branch three weeks postoperatively and the patient ultimately expired. A second bifurcation graft was improperly fabricated and ruptured on the eighth postoperative day. This was successfully removed and replaced with a nylon prosthesis.

Polyvinyl sponge prostheses were used in replacement of two femoral aneurysms but neither operation was succesful. In one instance the graft became infected and required removal. This patient expired from the resultant septicemia. A second such prosthesis thrombosed after two years and was later replaced successfully by a nylon by-pass graft.

Arterial Homografts

Arterial homografts sterilized with beta-proprio lactone and stored in Hank's solution,[9] were used as arterial replacements in 28 instances (table 4). One thoracic aneurysm replacement was unsuccessful when the patient expired from generalized bleeding late in the

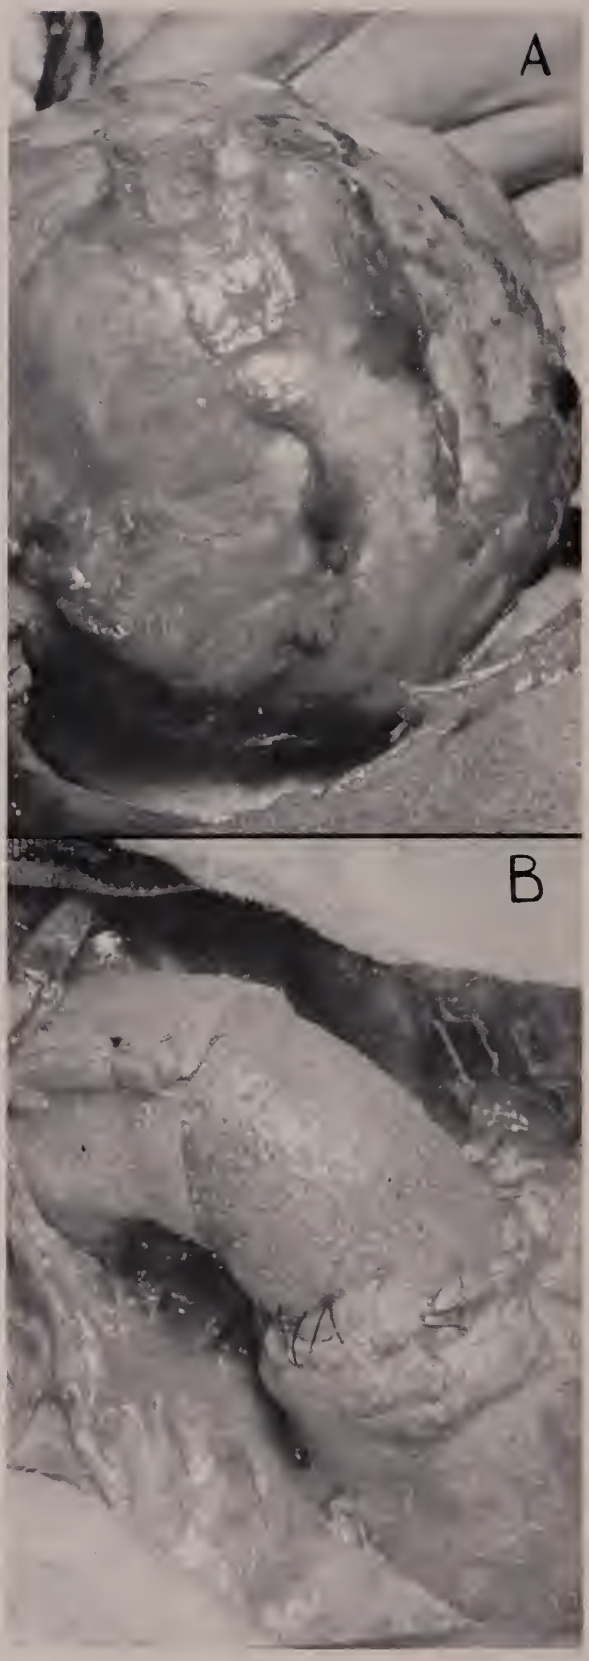

Fig. 5. (A) A large aneurysm of the thoracic aorta just distal to the origin of the left carotid artery. (B) Successful replacement of the distal aortic arch by an Ivalon arterial prosthesis. (Note the use of an Ivalon "belt" to reinforce the proximal anastomosis.)

Table 4. Aneurysms Repoired with Arterial Homografts

Artery	No.	Successful	Failure	Expired
Thoracic Aorta	1			1
Aortic Abdominal	16	13	2	1
Aortic Bifurcation	11	7		4
Total	28	20	2	6

operation. One abdominal aortic homograft ruptured 14 days after its insertion and the patient expired. In two other instances the homografts ruptured at the time of surgery but were successfully replaced with other arterial prostheses. (See figure 3.)

Nylon

Twenty aneurysms were replaced with nylon arterial prostheses of the Edwards-Tapp type (table 5). Nineteen were of the abdominal aorta

Table 5. Aneurysms Repaired with Nylon Prastheses

Artery	No.	Successful	Failure	Expired
Abdominal Aorta	2	2		
Aortic Bifurcation	18	13	1	4
Femoral	1	1		
Total	21	16	1	4

and one was in the femoral artery. One prosthesis thrombosed during the operation but was satisfactorily replaced with an arterial homograft. Nylon has the great disadvantage of permitting blood loss through the graft substance during the initial three to four minutes of its function. (See figure 4.)

Autogenous Grafts

Autogenous saphenous vein was used in replacement of 5 peripheral aneurysms (table 6).

Toble 6. Aneurysms Repaired with Autogenous Saphenous Vein

Artery	No.	Successful	Failure	Expired
Axillary	1	1		
Popliteal	4	3	1	
Total	5	4	1	0

Where the graft must withstand a high degree of flexion and foreshortening (axillary, cervical and popliteal areas), the saphenous vein autograft is felt to be the only one suitable. One such graft thrombosed 18 months after insertion into the popliteal artery but all the others have been successful.

Repair

In 11 instances the aneurysm was repaired either by direct anastamosis of the mobilized

Table 7. Aneurysms Repaired without an Arterial Graft

Artery	No.	Successful	Foilure	Expired
Carotid	1	1

Thoracic Aorta	2	2		
Abdominal Aorta	6	3		3
Total	11	6	0	5

segments of the divided artery or by aneurysmorraphy (table 7). In six instances this technique was successful and in five others, the patients expired. Failure was usually associated with attempts to repair ruptured aneurysms. As a general rule, it is felt that excision of the diseased segment is preferable to plastic repair of the dilated artery which permits some diseased vessel wall to remain.

Risks

The old problem of accepting surgical risk is a large one when considering aneurysm removal in the aged. However, if one decides on a conservative course, he must accept high incidence of rupture and the poor prognosis in such event (69 per cent mortality), (table 8). Surgical risk

Table 8. Arterial Aneurysms

	No.	% Successful	% Failure or Expired
All Aneurysms Resected	114	76	26
Elective Operations	96	87	13
Ruptured Aneurysms	18	29	69
Thoracic Aneurysms	13	38	62
Abdominal Aneusysms	91	82	18
Peripheral Aneurysms	10	90	10

seems less formidable in view of the fact that there was only one death in this series associated with elective excision of an abdominal aortic aneurysm.

Technical problems attendant upon excision of thoracic aneurysms are great and are reflected in the 62 per cent mortality in the present series. A pump oxygenator was utilized in three instances to by-pass the lesion during its removal, thus perfusing the abdominal viscera with oxygenated blood (Figs. 5, 6). An aorta or left auricle to femoral artery shunt, assisted by a pump, was used in two more instances for the same purpose. Arfonad* was used in most instances during excision of thoracic aneurysms to prevent the severe upper extremity hypertension caused by clamping the thoracic aorta at a high level. If it is not prevented, the left ventricle will fail rapidly and cardiac arrest will develop.

Relatively new techniques have caused us to feel that most thoracic aneurysms are now at least theoretically resectable. If only the later cases in which these techniques have been employed are considered, mortality from the operation is acceptable. Much will be done to advance these surgical techniques but even now the extremely high incidence of fatal rupture and the

*Tri-methaphan camphor sulfonate ½ per cent solution, Hoffmann-LaRoche Company.

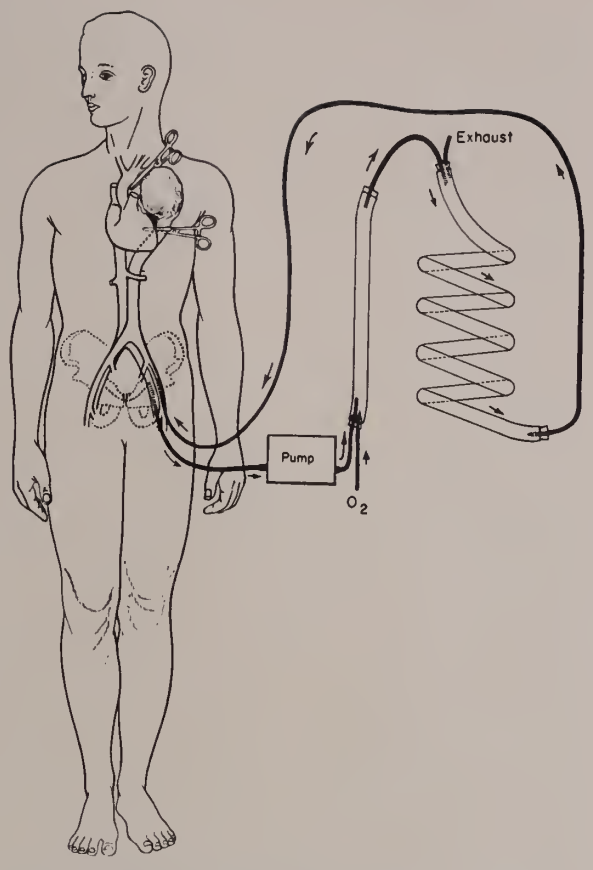

Fig. 6. Schematic diagram of the use of a pump oxygenator (DeWall Lillilei type) in the resection of thoracic aneurysm (Fig. 5).

poor outlook for conservative approach (three years) encourage favorable consideration for surgical excision.

Relief of symptoms following excision of an aneurysm is usually dramatic. Abdominal discomfort is relieved at once as is abdominal pain. In instances of radicular type pain referred to thighs or legs, relief may be delayed. Source of these symptoms is not clear. They may be due to direct physical encroachment of the aneurysmal mass upon the lumbar plexus; they may be due to referral from sympathetics over the aneurysm, or they may result from ischemic changes following occlusion of the lumbar arteries by extension of the intraluminal clot. Of 7 patients who had severe leg pain, 4 had immediate relief, while in 3 the symptoms remained for three, four and six months, respectively.

Conclusion

In repair of 114 arterial aneurysms, 49 compressed polyvinyl sponge prostheses, 28 arterial homografts, 21 nylon prostheses and 5 saphenous

vein autografts were used. In 11 instances arterial continuity was reestablished without use of a graft. The procedure was successful in 78 per cent of all aneurysms operated upon and in 87 per cent of those undergoing an elective procedure. In only 29 per cent of this series was it possible to salvage the patient after the aneurysm had ruptured.

Recovery of the patient following major arterial surgery has been dramatic, even in the highest age groups, with the average hospital stay being only 10 days. It is felt, that if blood loss is kept to a minimum and the anaesthesia well controlled, the procedure may be undertaken electively with a minimum of risk.

Bolivia—A Case Study in Foreign Aid

Bolivia rates as the South American country receiving economic aid from the United States. The program was started in 1953 to tide the country over a "temporary emergency." But for the past three years the United States has been contributing twice as much for public purposes in Bolivia as the Bolivian taxpayer. This has neither restored the economic balance nor assured stability in Bolivia. Plans to taper off U.S. aid are being shelved each year and appear dimmer now than ever.

Bolivian aid is listed in the U.S. Budget as "defense support" although it would require a great deal of imagination to visualize what bearing this country in the center of South America, without an army or a seacoast, has upon the defense of the United States.

Bolivia's trouble stems from a bloody revolution in 1952 which threw the country into a turmoil from which it will be long recovering. The new government nationalized the mines, expropriated the farm owners, sent a large segment of its educated class into exile, and drove private industry and commerce toward bankruptcy. Within a year Bolivia's people were starving and the government was in trouble up to its neck.

It is quite likely that another revolution would have driven the government out no later than 1954 if U.S. aid had not come to its rescue.

Most of the U.S. aid was used not to strengthen local productive capacity but to boost imports and support consumption. This discouraged local production and enabled the country to live beyond its means.

The government so far has shown no inclination to cut its expenditures to a level which Bolivian taxpayers are willing and able to support. Bolivia's tax load is low. At 5 to 7 per cent of gross national product it compares with a tax burden of 25 per cent of the gross national product in the United States.

Income tax collections dropped from an average of $3.5 million between 1948 and 1952 to $0.5 million by 1956. Property taxes shrank from $0.5 million to $124,000. Mine royalties used to be a mainstay of the Bolivian budget. But the government corporation which took over the mines in 1952 paid none. Royalties were re-established in December 1956 by supreme decree as part of the stabilization plan. But so far none have been paid.

The tin and tungsten mines are Bolivia's only source of foreign exchange besides U.S. aid. They used to be profitable. But soon after nationalization, the mine payroll swelled from 26,000 to almost 40,000, and production declined. The mines showed vast deficits which the government covered by printing more banknotes.

The low productivity of labor is the main reason for the high costs of production in the mines, in petroleum, in agriculture, for the excessively large staffs of the ministries and the high cost of government.

At many jobs there are twice or three times as many people as are needed. To watch them "at work" is a frustrating experience to Americans.

By Mr. Roger A. Freeman in The Freeman, December 1957, Volume 7, pp. 32-37.

The Vomiting Child

Recognition of a Surgical Cause

F. H. Bentley, M.D.
PORTLAND, OREGON

Diagnosis of the underlying cause of vomiting in an infant or child sometimes sets the doctor a difficult problem, one that has to be solved largely by clinical judgment. Between the fear of an unnecessary operation—which may be as harmful to an ill child as it is depressing to the doctor's sense of responsibility—and the anxiety over missing a dangerous surgical condition, lie many hours of observation and care. Although it may appear that most acute diseases of childhood are attended by vomiting, the common surgical lesions which are responsible for this symptom are mechanical obstructions of the alimentary canal, and pyogenic inflammation inside the peritoneum. In surveying the subject as a whole, and regarding my own material over the last five years, certain clinical points stand out as means of distinguishing these surgical conditions from diseases not requiring operative treatment.

Mode of Onset

While it is a truism of medicine that a careful clinical history is of the first importance, the way in which the symptoms of illness first present in a vomiting child gives a particularly valuable diagnostic clue. Each surgical lesion has its own pattern of onset. The troublesome "salivation" of a newborn gives an observant nurse the first hint of a tracheo-esophageal fistula, and has been the basis of early investigation and diagnosis in two of my recent cases. Gradual onset of regurgitation of gastric contents after some days of normal feeding in a newborn, is a well recognized feature of congenital pyloric stenosis, helping to distinguish it from an incontinent cardia or from pyloro-spasm. Such an onset is the opposite of what is to be looked for in another grave obstruction in infants—intussusception. In a case of intussusception, inquiry of the parents will usually reveal that the illness started abruptly, the healthy child suddenly crying and then going pale and quiet, possibly sweating, in a brief period of collapse before crying is resumed. I depend considerably on this history in diagnosing intussusception, of which the following case is a good example.

L. L., aged 4 years, was sitting on his grandfather's knee in the evening and suddenly fell backwards onto the floor, striking his head. He was picked up pale and listless, and in a few minutes he vomited. Injury to the brain was suspected and the child was admitted to the hospital neurosurgical service. Other signs of brain injury were absent, and on questioning the grandfather it became evident that the child had not accidentally fallen from the knee but had suddenly stiffened and thrown himself backwards. Such an onset followed by shock raised the suspicion of intussusception, and it was not surprising to find that vomiting continued and abdominal distention began. Operation was performed to find an irreducible ileo-ileal intussusception, requiring resection in two stages.

In another case in which intussusception occurred three times, the mother was so struck by the sudden onset of pain and the brief period of shock at the start of the first attack, that she quickly recognized the recurrences on the next two occasions, bringing the child to the hospital with the laconic statement, "He's done it again!"

It is perhaps enough to give these examples, and to emphasize that other illnesses in which a surgical condition causes vomiting have their own pattern of onset, which if studied in detail will guide the doctor in his thinking, whether the problem is a rare one like mal-rotation of

Presented to the Oregon Academy of General Practice, Portland, Oregon, Sept. 26, 1957.

the gut with volvulus in early infancy, or the common one of acute appendicitis later in childhood.

Progression of Symptoms

The "surgical abdomen" is rarely a self-curing one, but tends to get worse. Observation over a period of hours will reveal the progression of symptoms and the exacerbation of physical signs. Only the surgical-tyro with itching fingers will wish to operate on a vomiting child until the need for operation is made manifest by a period of watching. When there is an underlying surgical condition, not only do the symptoms and signs of illness continue, but they progressively worsen. Over a period of four to eight hours the changes can be noted and, if there is no progression of symptoms, further watching will be justified. In the last three years I have seen three newborn infants whose symptoms were vomiting of bile-stained material associated with abdominal distention. Over a period of two days the condition remained unchanged, the baby still vomiting and still with a distended intestine. But the vomiting remained biliary and the pattern of distended gut did not enlarge. Because of the findings and the failure to improve, operation was performed on the first two babies and no surgical lesion of any kind was found. In the third baby, operation was advised against, on basis of the above experience, and slowly the condition subsided.

When the increase of symptoms and signs indicates a need for operation, we accept the result as the normal diagnostic process of surgery. But when the doctor's clinical judgment advises against operation, it is not only a very anxious decision, but a triumph to remember when the ill child is well again. Such an example was a boy of 3 years with a staphylococcal septicemia. Under the influence of antibiotics the condition was slowly brought under control, and after a week the boy seemed to be recovering when he developed generalized abdominal pain, rigidity and vomiting. Blood culture was at this time negative. The abdomen was equally tender all over, and the rigidity was maximal on the left side. Since a generalized septicemia will sometimes end with formation of a "fixation abscess," I was inclined to think that a primary peritonitis was likely cause of the symptoms. The child was carefully observed; temperature and pulse did not deteriorate further; pain and rigidity remained about the same; vomiting was intermittent but not increasing, and with further use of antibiotics plus intravenous fluids this new alarm subsided over four days of meticulous observation. Lack of progression of symtoms and signs in a carefully observed child was the basis for withholding operation at a difficult time.

It is, of course, possible to wait too long in making a decision for or against operation. Accurate observation is not meant to be a cloak for timidity or procrastination. We have all seen late cases of peritonitis in children ignored or treated with purgatives or tranquilizers. These patients were *not* observed, and the evidence of progression was not noted. It has been my experience that it is usually possible to tell within a period of six to eight hours whether the progression of events is going against the child.

Presence of Certain Physical Signs

(1) *The vomitus.* It is of obvious importance to recognize the quantity and quality of fluid vimited—whether gastric contents, containing bile, or intestinal in nature. Though the vomiting of biliary material indicates only a serious degree of vomiting, not necessarily obstructive, it should certainly alert the mind to the possibility of an obstruction. On the other hand, a vomitus of brownish intestinal fluid is sure evidence of an intestinal block which may be paralytic or mechanical in origin, but it is a late sign of such serious significance that diagnosis should not wait on its development.

(2) *Distention.* If an obstructive lesion is high in the alimentary canal, there will be no abdominal distention except of the stomach. However, if gastric distention is evident (seen through the abdominal wall or on x-ray of the abdomen) and is *persistent*, it presumes an obstructive lesion. The waves of gastric peristalsis in the presence of chronic pyloric obstruction are well-known as a diagnostic pointer in congenital pyloric stenosis.

An obstructive lesion lower down in the small gut will produce characteristic central distention with visible dilated coils. But if obstruction is in the distal colon, the shape of the abdomen is quite different, and there is distention of the flanks as well as centrally, as seen in acute Hirschsprung's disease or in atresia of the colon. I recall a 5 day old infant with such distention plus fecal vomiting. A finger could be introduced per rectum without difficulty. The distention in the flanks indicated a large bowel obstruction and, as the child was almost in extremis,

a simple transverse colostomy was performed through a small incision in the epigastrium with dramatic improvement. Subsequently the obstruction proved to be due to an a-ganglionic segment of rectosigmoid (Hirschprung's disease), which was treated successfully at the age of 1 year by the Swenson pull-through colectomy.

The other important feature of distention when caused by a surgical lesion is that it is progressive. Taken by itself, moderate abdominal distention would not be a reason for operation. An increase in the swelling over a period of hours would be strong evidence of an underlying obstruction—though not in itself indicative of the nature of the obstruction.

(3) *Tenderness.* The experienced doctor learns the feel to the hand of the acute abdomen, and with the hand resting gently on the abdominal wall can appreciate the tenderness and the degree of muscle guarding or true involuntary rigidity which indicate with certainty the presence and extent of an underlying inflammatory lesion. It is no more possible to describe this readily in words than it is to take an intern's opinion about it on the phone. The abdomen simply has to be felt by the doctor in charge. There is a great difference between the tenderness and muscle guarding set up by *gentle* pressure with the flat of the fingers when there is an underlying pyogenic inflammation, and the softer more doughy resistance of such nonsurgical inflammations as mesenteric adenitis or enteritis. Acute mesenteric adenitis—so common in childhood—can usually be differentiated from acute appendicitis on clinical evidence, of which the feel of the abdomen with lack of that acute sensitivity to gentle palpation is the most important sign.

(4) *Presence of a Lump.* It is an old adage that we find only what we are looking for, and it is important to remember to look for a lump in a vomiting child. It takes time and patience to feel the pyloric tumor in a 3 week old crying male, and I do not have a 100 per cent score by any means! There are those who claim always to be able to feel this muscle tumor when it is present, and it is certainly true that the lump is there to be felt by those blessed with patience, gentleness and perseverance. The same is true of the intussuscepted bowel mass in intussusception, though the rib cage may prevent palpation of the lump when it is in the distal transverse colon.

Perhaps the most important lump of all to look for in a vomiting child is one at the hernial sites that is easy to miss in the fat pad of a child's groins. A recent case is illustrative. A plump female baby of 6 months was admitted to the hospital with vomiting and diarrhea, and was treated as a case of enteritis. X-ray showed dilated coils of small gut and the question of malrotation was raised. The diarrhea increased and the vomiting was progessive. Examination at this time showed in the right inguinal region a tense swelling the size of an olive, buried in the fat of the external ring, and only obvious on the most thorough palpation. Operation was performed to reveal a strangulated Richter's hernia, already showing a gangrenous constriction ring.

A lump however is not always indicative of a surgical condition. A mass of glands in the mesentery may be so localized as to form a tender, demarcated swelling in the right lower quadrant or along the root of the mesentery. Mildness of the symptoms and lack of acute tenderness or reaction around the lump gives the clue to its nonsurgical nature.

Ancillary Aids

Laboratory work is not of particular help in distinguishing between surgical and nonsurgical conditions in the vomiting child, and undue reliance on laboratory findings rather than on clinical judgment can do positive harm. I have seen surgical consultation deferred because right sided pain, tenderness, pyrexia and vomiting were accompanied by a few blood cells in the urine. Presumption of a pyelitis excluded consideration of acute appendicitis until the onset of peritonitis awakened the doctor to a true realization. In this case a gangrenous appendix lay retrocecally alongside the ureter.

It is not uncommon in patients with acute appendicitis to find a white cell count of only 9,000 and I had a patient with acute mesenteric adenitis whose while cell count climbed to 26,500, 78 per cent being polymorphonuclear cells. Laboratory findings have to be weighed and considered in the management of the child, but they are not in themselves of particular diagnostic value.

An x-ray of the abdomen can be a comforting confirmation of the presence of a distended stomach or of dilated coils of bowel, and may be of additional help in locating the site of obstruction. It is equally useful in excluding a distended bowel, and therefore an obstruction, when vomiting is the main symptom. The use of barium

contrast is more debatable. A barium enema will help to demonstrate an intussusception in the unusual instance where there is doubt about the clinical diagnosis. There is only a little danger in such investigation, but if the barium cannot be evacuated, and if operation has to be performed subsequently, the barium in the bowel is at best a nuisance and may be worse.

Giving of barium into the stomach in the presence of an obstruction can be done through a catheter, but in my view the information this makes available is of doubtful accuracy, and does not justify the hazards of the method as a routine inquiry. It is difficult to recover the barium and, if vomiting persists, some chemical will enter the lungs where it is particularly irritating. Following release of an obstruction, barium in the large bowel is sometimes hard to expel, and is certainly a hindrance at operation. If the method could be used with the precision we now enjoy in the x-ray diagnosis of, say, peptic ulcer, drawbacks might be forgiven, but such accuracy is not possible. Two examples are illustrative. The first, a boy of 4 weeks who was vomiting. X-ray showed that the stomach emptied quite well and that the barium reached the small gut. Yet operation revealed the characteristic muscle tumor of congenital pyloric stenosis, and the baby was cured by a Ramstedt's myotomy. The second, an infant of 6 weeks who also was vomiting. Barium x-ray suggested mal-rotation because of the direction and dilatation of the duodenal loop. Operation revealed no anatomic abnormality, and no surgical lesion as cause of the vomiting.

There is an awakening of interest in the use of water soluble contrast media in the diagnosis of bowel obstruction in infants, and with experience this method may justify its use. But for the present I believe the diagnosis of a surgical lesion in a vomiting child is largely a matter for clinical judgment and skill, and one in which the art of medicine can provide a high degree of accuracy and clinical reward, based on the details of the history and a watchful appreciation of physical signs.

330 Medical Arts Building (5).

Ulcerative Colitis Foundation Formed

With the encouragement of the National Institute of Arthritis and Metabolic Diseases, a new medical research foundation has been organized to promote research in ulcerative colitis. Joseph B. Kirsner of the University of Chicago, chairman for the conference where the new project was announced, said it was "an essential step toward finding the cause and cures for this dreadful disease." Mr. Miles Fiterman, Minneapolis businessman who heads the foundation, said plans are to provide researchers with "continuing and guaranteed funds" for research. He explained that one of the foundation's purposes is to "provide a climate for research that will attract outstanding men so that more progress may be made in solving the problems of ulcerative colitis just as progress had been made in recent years in the fields of polio and heart disease." The foundation's medical advisory board includes Dr. Kirsner, Walter L. Palmer of the University of Chicago, Jacob A. Bargen of the Mayo Clinic, Julian M. Ruffin of Duke University and president-elect of the American College of Physicians, Stewart G. Wolf, Jr., of the University of Oklahoma, and Owen H. Wangensteen of the University of Minnesota and Howard P. Lewis of the University of Oregon.

Duodenal Ulcer As an Etiologic Factor in Gastric Ulceration

JACK D. BALLARD, M.D.
AND
J. THOMAS PAYNE, M.D.
SEATTLE, WASHINGTON

Study shows that duodenal ulcer usually appears first, when found with gastric ulcer, and may be etiologic. Medical treatment may not suffice. Malignancy should be considered in gastric ulcer without concomitant duodenal ulcer.

Gastric ulceration has been noted by only a few to be associated frequently with the deformity of duodenal ulcer. This is surprising in view of reports of increased gastric secretion and actual ulceration associated with pyloric obstruction.

Friedman[1] noted in 1914 that gastric ulcers produced with silver nitrate healed quickly if the pyloris was not obstructed. In 1927 Ivy[2] noted hypersecretion in a Pavlov Pouch if the pylorus was obstructed. Pyloric obstruction was observed by Matthews and Dragstedt[3] in 1932 to cause ulcers in duodenal and jejunal transplants on the stomach. Shay[4] in 1945 and Harkins[5] in 1947, both utilizing the Shay rat, demonstrated hypersecretion and ulceration of the stomach following pyloric obstruction.

Clinical reports which implicate duodenal ulcer deformity in the pathogenesis of the gastric ulcer are infrequent. Emery[6] in 1931 found that 50 per cent of patients with gastric ulcer had six-hour retention following a barium meal. He further noted that when duodenal ulcer and gastric ulcer coexisted, relief of the duodenal obstruction by treatment was followed quickly by disappearance of the gastric ulcer. Huber[7] in 1948 reported two patients who had exhibited duodenal ulcer scarring for many years before they developed gastric ulcers. In 1955 Johnson[8] reported 119 cases of coexisting duodenal and gastric ulcers. Gastric retention was a common finding. He reported that one out of every six patients hospitalized for pyloric obstruction already had a gastric ulcer. The duodenal deformity was almost invariably noted to have antedated the gastric ulceration.

A cursory review of our patients with gastric ulceration suggested a relationship to duodenal deformity; therefore, a more careful study was undertaken.

Material

Fifty-nine patients with gastric ulcer were treated over the past four and one-half years in the 300-bed Seattle Veterans Administration Hospital. All patients were males. Age range was from 26 to 77 years. Average age was 55.4 years (Fig. 1).

Fig. 1. Gastric ulceration is a disease most frequently seen in patients between 55 and 65 years of age.

All gastric ulcerations were diagnosed by x-ray, excepting three which were found at surgery or at autopsy. All were lesser curvature ulcers.

Read before the Annual Meeting of The Seattle Surgical Society, Seattle, Washington, Jan. 25-26, 1957.

All duodenal ulceration or deformity was diagnosed by x-ray, at surgery or autopsy.

Observations

The patients seemed to fall into three groups:

1. Acute gastric ulcer with short duration of peptic ulcer symptoms. These invariably were associated with some other acute illness. (See figure 2.)

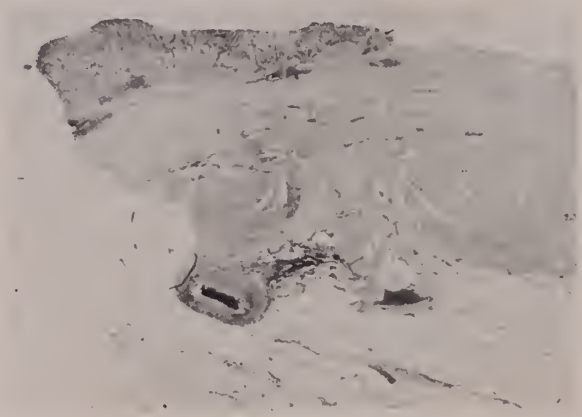

Fig. 2. Acute gastric ulcer is most often associated with some other acute illness. Note the superficial mucosal erosion without involvement of muscularis and with minimum of fibrosis. (x100.)

2. Gastric ulcer without associated acute illness and without duodenal ulcer deformity (Fig. 3).

3. Gastric ulcer without acute illness but with duodenal ulcer deformity (Figs. 4, 5, 6).

Fig. 3. Example of a gastric ulcer without associated acute illness and without duodenal ulcer deformity. This lesion is very difficult to distinguish from carcinomatous ulceration except by histologic examination.

Table 1. Summary of Patients with Gastric Ulceration

	No.	Ulcer Symptoms	Deformity of Duodenal Ulceration	Assoc. Acute Illness
Acute Gastric Ulcer	19	0-1 yr.	5	19
Gastric Ulcer Alone	20	7.5 yrs.	0	0
Gastric Ulcer with Duodenal Ulcer Deformity	20	12.7 yrs.	20*	0
Total	59		25	19

*Includes 2 cases of adult hypertrophic pyloric stenosis.

Of 59 gastric ulcer cases, 25 had duodenal ulcer deformity or pyloric obstruction.

There were 16 patients between the ages of 26 and 50 years. Eight (50 per cent) had associated duodenal ulcer deformity.

In the older age group, between 50 and 77 years, there were 43 patients. Fourteen of the 43 had duodenal ulcer deformity with the gastric ulcer. However, 15 of the 43 had an associated acute illness. Eliminating this stress group, the remaining 28 patients with gastric ulceration had a 40 per cent incidence of associated duodenal ulcer deformity.

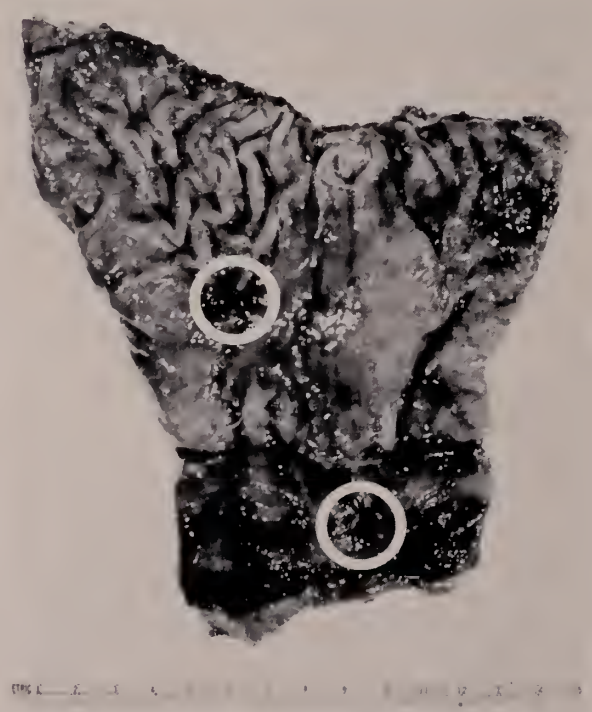

Fig. 4. Gastric ulcer coexisting with chronic scarred duodenal ulcer. Ulcers are encircled; both are deep and penetrating with much scarring of the base.

Discussion

The frequency of duodenal deformity with gastric ulceration was noted as early as 1917 by Carman.[9] Since then, in voluminous literature

Fig. 5. Gastric ulcer in a patient with chronic duodenal ulcer (same patient as in Figs. 4 and 6). Note the sharp "punched out" margins, minimal fibrosis and large vessels in base. (x100.)

on peptic disease and gastric ulcer, the problem has been noted by relatively few persons. Feldman[10] reviewed the literature in 1953 and found a range of 20 to 50 per cent from all authors. The incidence showed some variation, depending on the technique of case finding used.

Johnson[8] recently found that 25 per cent of patients with gastric ulceration had associated duodenal ulceration or deformity from previous ulceration. His observation methods were similar to those used by us.

It seems apparent that in patients with gastric ulcer there is a high incidence of duodenal ulcer deformity and that in the younger age groups this approaches 50 per cent. Aside from the stress gastric ulcer in the aged, there is a very high incidence of the two appearing concomitantly (40 per cent of our group). This frequent association is sufficiently high to demand consideration of duodenal ulcer as an etiologic factor in gastric ulceration. Huber[7] and Johnson[8] noted that duodenal ulcers occur very frequently prior to appearance of gastric ulcer.

Experimental findings of Dragstedt et al,[3,11,12] Friedman[1] and Ivy[2] support this thesis.

It seems possible that distal obstruction may play a part in the production of gastric ulceration. Johnson[8] showed 64 per cent incidence of gastric retention clinically or by x-ray examination in his patients with both gastric and duodenal ulceration. Our group shows 33 per cent with gastric retention. The presence of duodenal disease seems to alter motility in some fashion, even though mechanical pyloric obstruction is not demonstrable. The remarkable frequency of associated duodenal deformity suggests that it may be related to the pathogenesis of some gastric ulcers. Occasionally duodenal deformity was present as an acute ulcerative process but most often it was an old scar. This fibrosis and loss of bowel wall pliability could result in interference with normal propulsion of gastric secretions through the duodenum. Similarly, the bolus of food may have longer contact with the antrum and consequently cause greater volume of peptic secretion. The barium meal does not always reflect this altered physiology. It is possible that this is the mechanism involved. Dragstedt has postulated this, and from our patients this seems to be true except for one small group of patients—those with acute stress ulceration. Even stress ulceration in the stomach may be attributable to gastric retention—e.g., as is commonly seen in burns.

The final group of aged patients with gastric ulceration without duodenal malfunction and without an acute stress situation remains the enigma. Their lesions may be precancerous.

Fig. 6. Chronic duodenal ulcer in a patient with coexisting gastric ulcer (same patient as in Figs. 4 and 5). Note the marked fibrosis extending into Brunner's Glands, bespeaking its chronicity. (x300.)

From a therapeutic viewpoint, it would appear that gastric ulcer associated with duodenal deformity had best be treated by gastric resection or some adequate physiology-altering procedure or both, plus gastric drainage. It would appear further that attempts to treat such ulceration medically may be doomed to failure eventually.[13]

Summary and Conclusions

The occurrence of gastric ulcer in patients with duodenal ulcer or residue of duodenal ulcer

is more than coincidental, as attested to by several laboratory and clinical observations. A group of 59 patients with gastric ulceration has been studied. One-third of these patients sustained their gastric ulcers acutely and in association with another illness and, therefore, were considered as having stress ulceration. One-third of these patients had chronic gastric ulceration without any other disease and without duodenal disease or scarring. One-third of these patients had duodenal ulceration or deformity in association with the gastric ulcer. In the group of patients below 50 years of age with gastric ulcer, one-half had associated duodenal ulceration or deformity. If the stress ulcer group were excluded, 40 per cent of the older age patients had both lesions.

This suggests that duodenal malfunction plays a role in the genesis of gastric ulcer, and that where the two lesions coexist medical therapy may be difficult or impossible.

MDs To See New Medicolegal Film in June

The AMA Law Department announces that "traumatic neurosis" will be the subject of the third film in the series of six medicolegal films to be produced in cooperation with the Wm. S. Merrill Company of Cincinnati. The film will delve into some of the problems that face psychiatrists and neurologists in identifying patients' psychoses resulting from various traumatic experiences. Physicians will have an opportunity to see the premiere showing of this film at AMA's Annual Meeting in June in San Francisco.

Previous motion pictures in the series include "The Medical Witness" and "The Doctor Defendant." Other films in the series will deal with in-hospital medical professional liability problems and forensic pathology.

Inguinal Hernia

Part I. Principles

JOHN SONNELAND, M.D.
SPOKANE, WASHINGTON

The principles of a good, sound reconstruction of the inguinal area are few and readily applied. That these principles are not being universally taught or applied effectively is reflected not only by that continuing index of confusion, the very bulk of the hernia literature (some 700 articles per decade), but by the wide variation among operators in rate of hernia recurrence.

It is little wonder that many physicians express a certain degree of uncertainty over the anatomy, and consequently the surgery, of inguinal hernia. One who attempts to study inguinal anatomy from the maze of the literature soon finds that structures are discussed which he does not see at the operating table, that various authors ascribe different names to what is essentially the same structure, and that some authors parrot the errors of their predecessors. As though faulty appreciation of the basic anatomy could be corrected by magical materials of repair, we find the literature crowded with claims and counterclaims for materials derived from animal (fascia lata, shreds of external oblique, cutis grafts, preserved fascia, heavy catgut and kangaroo tendon), vegetable (silk and cotton) and mineral (metallic shields and wire of silver and steel).

From my experience with 214 patients upon whom I have operated, I am convinced that the essentials of inguinal anatomy are simple, that they can be applied easily to surgical correction of the great majority of hernias, and that the surgery can be competently performed by those surgically inclined with a recurrence rate not over 2 or 3 per cent. These essentials are described in the pages to follow.

Death Rate from Hernia

In the normal distribution area of NORTHWEST MEDICINE (Oregon, Washington, Idaho and Alaska), it is estimated that about 30,000 people have uncorrected hernias, and in 1955 265 people died from the effects of hernia.[1] The death rate from hernia is almost entirely due to strangulating intestinal obstruction and, in fact, over 40 per cent of all cases of strangulating intestinal obstruction are due to incarceration in external hernias.[2] Put another way, the 265 people who died from hernia in the Pacific Northwest and Alaska numbered almost *twice* the total who died from appendicitis, poliomyelitis, scarlet fever and the usual childhood diseases. Furthermore, the death rate from hernia almost equals the death rate from all causes of peptic ulceration (8,654 *versus* 9,730, continental U.S.A., 1955).[1] Despite such statistics, there is a general apathy about the seriousness of hernia. This apathy is reflected even in the health policy of state government. As an example, 144 people in the State of Washington lost their lives in 1955 from hernia, yet Washington's Department of Public Assistance has taken a surgically indefensible position of refusing authority for elective hernia surgery!

Is It a Hernia?

Inguinal masses rarely confused with hernia are aneurysm, varicocele, lymphadenopathy, cord hydrocele and tumors of the constituent soft tissues of the abdominal wall. An undescended testicle is almost always associated with hernia, and correction of both conditions is mandatory, as malignant change in the testicle is about 2 to 3 per cent if it is not corrected or removed.[3,4] The differential diagnosis of direct from indirect and of inguinal from femoral hernia is of interest, but largely of didactic interest—the surgical approach is identical.

The Dilated External Ring

By itself, the dilated external ring is not an indication for surgery or for employment rejec-

tion. Anatomically, it is well established that the external ring varies in size among normal subjects. If the ring has been dilated by a large inguinal hernia, the hernial protusion itself should be so easily felt that the external ring dilatation is of only casual interest.

The Bulge at Hesselbach's Area

We find in many elderly patients a weakened and thinned transversalis fascia overlying Hesselbach's area. A slight bulge is felt. Is this a hernia? Certainly it can be so construed only in the most literal sense. An ill-defined line of good judgment must be drawn to separate these patients from those with a gross direct inguinal hernia.

Hernias in Children

These may be safely corrected in infancy if the anesthetist is mindful of adequate oxygenation, and if the surgeon is mindful of the ease with which he may injure the vascular supply to the testicle. About 15 to 20 per cent of pediatric hernia patients will have bilateral hernias,[5,6] the second side of which may not be apparent upon initial examination. Should a clinically uninvolved contralateral side be explored? Robert Gross, who formerly did both sides, in 1953 indicated that he had abandoned the procedure,[6] and in 1957 in a personal communication stated that he again was doing both sides. I explain the odds to the parents, and let them decide.

The technique of infant hernia surgery should be kept to its essentials: short, transverse incision over the internal ring; isolation of the base of the cord; dissection of a short sac from the cord; if sac is long, infiltration with normal saline between sac and cord to facilitate transection of sac near internal ring (distal sac is left *in situ* open-mouthed); suture ligation of the sac deep to the internal ring; narrowing of the internal ring by suture; and anatomic closure of the external oblique and skin.

In a series of 369 cases of recurrent hernia there were 12 patients who had had inguinal herniorrhaphy in childhood, 11 of the 12 recurrences appearing at the indirect site.[7] This would argue for adequate, secure ligation of the sac and narrowing of the ring, but not for a Bassini or Halsted reconstruction of Hesselbach's area.

Hernias in the Elderly

The risk of surgery in the aged has been grossly exaggerated at times by those not familiar with the physiologic ease of such surgery under ideal conditions of anesthesia and technique. Many elderly patients have contended with the trials of ill-fitting, ill-kept trusses only to be pleasantly surprised by the ease of their surgical recovery. Surgery should be undertaken only after the cure of any condition causing repeated groin strain. Determination of bladder residual should be a routine procedure in the elderly group. A keen suspicion of bowel tumor should lead to a careful colon history and possible barium enema. Chronic coughing should, in turn, be thoroughly investigated and corrected.

Inguinal Pain

Inguinal pain following exertion is not of itself an indication for surgery. Inguinal pain may indicate nothing more than a slight fascial or aponeurotic tear, which may heal without development of a hernia. Prolongation of inguinal pain without evidence of an inguinal mass at any of repeated examinations may be associated with the problems of neuroses or of industrial compensation. An inguinal mass should be found upon at least one examination before recommending surgery.

Anatomy of Inguinal Hernia

The surgeon is interested in tissues which will hold sutures. Erudite, Latinized discussions of nebulous middle inguinal rings, of filmy fascial strata, and of structurally unimportant anomalies are of little help in the practical understanding of inguinal anatomy.

The tissue of key importance in inguinal repair, the tissue which usually holds firm when sutured, is the transversalis fascia. This fascia is primarily the direct, the inferior extension of the transversus abdominus muscle. It receives only minor contributions from fine muscular insertions off the internal oblique.

In the past, references have been made to suturing the "conjoined tendon" either to inguinal or Cooper's ligament. The so-called conjoined tendon, when present at all, is short and almost never extends for more than 1.5 cm. lateral to the rectus sheath.[8,9] The stout structure found lateral to the rectus sheath margin is in actuality the transversalis fascia.

The transversalis fascia, which is the fascial extension of the transversus abdominus muscle, usually has the following properties. It is thinned, overlying Hesselbach's triangle. Its stronger portion *underlies* the free edge of internal

oblique (and the latter must be dissected back to see the tough portion of the fascia). Lateral to the internal ring its fibers begin to condense and thicken as they sweep medially across the femoral vessels to form the femoral sheath. It decussates around the cord to meet again medially, thus forming the internal ring. It is markedly attenuated as it reaches its insertion into Cooper's ligament.

If the stoutest superior structure is the transversalis fascia, what is the best anchor inferiorly to which it may be approximated, thus to bridge Hesselbach's area? Historically, the inguinal ligament has been that anchor. Some 15 years ago the idea of using Cooper's ligament was repopularized,[10-12] the primary arguments being that it was anatomically the natural insertion for abdominal strata deep to the external oblique, that by using it the femoral canal was essentially closed to hernia, and that the inguinal ligament was at best a moveable object below which hernias might conceivably occur as it was sutured upward.

From a practical standpoint, Cooper's ligament repairs have certain drawbacks. More tension is created on the suture line, partially remedied by rectus sheath relaxation incision. Repair of bilateral hernias at one operation by this technique, even with rectus incision, places undue stress on the sutures. Danger of injury to, or thrombosis of, the femoral vein is increased owing to inclusion of the vein as a strut in the repair. That is, as Zimmerman[13] pointed out, Cooper's ligament repair is a stepladder affair in which the ligament is used for the medial, femoral vein itself for the central, and femoral sheath (in reality, transversalis fascia extension) for the lateral portion of the herniorrhaphy.

The preponderance of surgeons appear to be presently using either a Bassini or Halsted repair for routine herniorrhaphy.[14,15] Cooper's ligament herniorrhaphy seems widely accepted for femoral hernias, and by some for recurrent and large direct hernias. It is very likely that entirely satisfactory results will be obtained by careful surgeons using either inguinal or Cooper's ligament repairs.

Essentially, then, the surgical target in inguinal hernia forms a letter "V," the apex of which is at the pubic tubercle. The superior limb of the "V" is formed medially of rectus sheath, laterally of transversalis fascia. The inferior limb is the stout inguinal ligament. When the limbs of the "V" are brought together with sutures, both the transversalis fascia and the inguinal ligament stretch a little. Should a femoral defect exist, the inferior limb of the "V" is properly Cooper's ligament, passing laterally to femoral sheath.

Why Do Recurrences Occur?

Recurrences have been well documented in the literature.[16-22] They are almost evenly distributed between indirect and direct recurrences, and of those recurring as direct hernias, the majority are found near the pubic tubercle.[21] Major reasons for recurrence are failure to elevate the cord and use transversalis fascia, use of absorbable sutures, tension on the suture line, failure to recognize a direct or femoral component in treating an indirect hernia, and improper treatment at the internal ring. Specifically, proper treatment at the internal ring includes: securely ligating the sac deep to the internal ring, minimizing cord bulk, and narrowing the internal ring. Other factors which should be cited include failure to recognize an indirect sac, dependence upon red tissue in the repair, infection, obesity occasionally, undue intraabdominal straining (urethral obstruction, chronic coughing, difficult bowel movements), and poor tissues. The latter is often the crutch upon which some rest to explain poor results, results which could be improved by attention to the details of good herniorrhaphy and, in particular, identification of and maximum use of the transversalis fascia.

An indirect sac, though small, has been said by some to exist in all persons. It would seem that an over-diligent surgeon may draw outward a tuft of peritoneum, mistaking it for an indirect sac. "In a series of several hundred specimens without hernial sac or patent processus vaginalis, it was observed that not the slightest peritoneal protrusion, or even small foveate depression occurred at the abdominal inguinal ring."[23]

Accurate percentage recurrence figures are notoriously difficult to assemble. With nonabsorbable suture technique using transversalis fascia, recurrence figures are reported in the neighborhood of 3 per cent or less, and Ryan reported no recurrences within six months in 7,000 primary and 369 recurrent herniorrhaphies.[7]

Summary

Anatomic principles emphasized are the following: transversalis fascia, not "conjoined tendon," is the primary material of repair; transversalis fascia is almost entirely derived from

transversus abdominus muscle; femoral sheath is a condensation of transversalis fascia, and as such, is a component part of that fascia; and patent processus vaginalis is not a normal, but a pathologic finding.

Each year about 265 people within the expressed publication area of this journal die from the consequences of uncorrected hernia, a death rate which almost equals the entire death rate from all complications of peptic ulceration. These deaths from hernia are essentially those of strangulation obstruction, external hernia accounting for over 40 per cent of all such intestinal obstruction.

Early repair of infant hernia is accomplished by ligation of the sac deep to the internal ring, and then narrowing the ring without further attempt at reconstruction.

Problems of recurrence include absorbable sutures, failure to recognize the second component of an inguino-femoral hernia, improper treatment at the internal ring, and inadequate use of transversalis fascia.

Diphtheria in Twin Falls, Idaho

CECIL R. REINSTEIN, M.D.
CHEYENNE, WYOMING
AND
W. W. BENSON, B.S., M.P.H.
BOISE, IDAHO

Low index of suspicion allowed full blown epidemic of diphtheria to develop at Twin Falls. Complacency, based on rarity due to effective control measures, could permit similar outbreak in any community.

In 1953 there was a total of 87 reported cases of diphtheria in Idaho. This represents a case rate of 14.5 per 100,000 population compared to the U.S. total of 1.5 per 100,000. Forty-seven cases occurred in Twin Falls County where the disease assumed epidemic proportions. Prior to the described outbreak, only 8 cases had occurred in this county since 1945, with a maximum of 3 per year. In addition to 47 clinical cases, 34 carriers were found. Ninety-two per cent of the cases occurred in a five-week period from February 1, 1953 through March 7, 1953 (Chart I). The epidemic peak was noted to be in the last week in February, with the onset of 17 cases. The age distribution of cases (Chart II) showed 46 per cent of cases in children under 14 years of age, and 54 per cent in the age group above 14. In the county, the maximum age specific attack rate was in the 15 to 19 year group, with 225.9 cases per 100,000 population compared to the attack rate in the county population as a whole of 111.3 cases per 100,000. One

CHART II

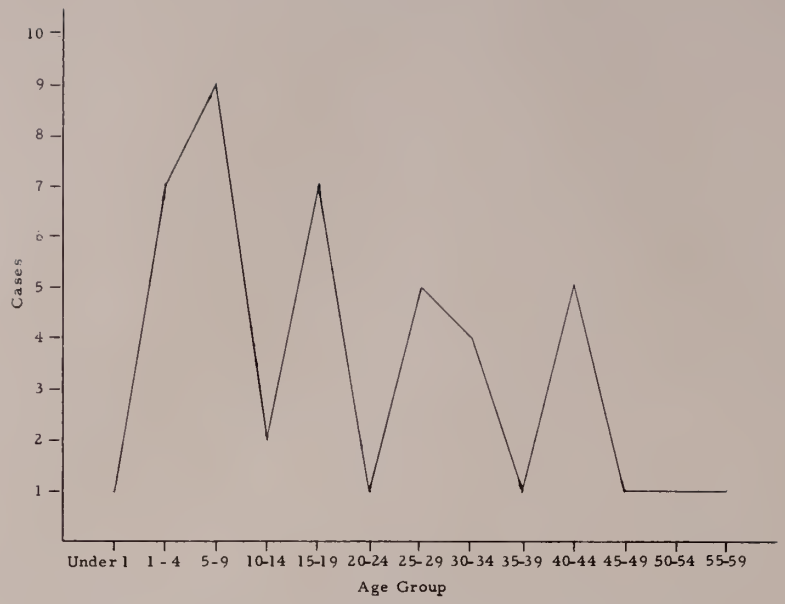

Chart II. Diphtheria cases in Idaho during 1953 by age group breakdown.

fatality occurred, giving a death rate of 2.3 per 100,000, compared to the national rate of 0.1 during the year.

Epidemiology

Diphtheria is an acute specific infectious disease characterized by local infection and general toxemia. The local lesion usually involves an epithelial surface, usually the throat, tonsils, larynx, nose or it may complicate a wound. In the classical form the lesion is pseudomembranous. The false membrane, formed primarily of interlaced necrotic cells, fibrin and bacteria, is remarkably tenacious and adherent. The organisms as a rule do not invade the tissue but multiply in the mucus of the surface epithelium. The powerful exotoxin, which is a coagulable protein, causes necrosis of the epithelial cells which become a part of the pseudomembrane overlying the ulcerated lesion produced. Removal of the membrane leaves a bleeding surface. The size of the membrane is generally proportioned to the quantity and rapidity of absorption of toxin. Extension of the membrane to the nasopharynx is usually associated with a more severe and malignant type of the disease with extreme toxicity resembling sepsis. Primary tracheal diphtheria is rare. Extension of the membrane to the trachea poses a different problem. The membrane is not likely to be as adherent, does not produce equivalent toxic symptoms, but is more likely to cause obstruction. The exotoxin produced by *Corynebacterium diphtheriae* is soluble, heat labile, and is nephrotoxic, cardiotoxic, and neurotoxic. Practically all of the clinical symptoms of diphtheria can be produced by the toxin experimentally.

Diphtheria is a disease of man; there is no satisfactory evidence that other animals are naturally infected. The source of all infections is a case or carrier, the latter constituting the ultimate reservoir responsible for perpetuation of the disease within a community. Contact with a case is, however, more likely to result in infection than is equal contact with a carrier.

Most diphtheria patients harbor the organisms for about two or three weeks, though a small percentage continue as convalescent carriers for several additional weeks or months. In rare instances, the carrier condition may persist for longer periods.

The diphtheria carrier harbors the organisms in the nose or throat, where the bacilli grow in diseased lymphoid tissue, usually the tonsils, adenoids, or nasal polyps. Many chronic nasal carriers show the presence of foreign bodies, but the condition disappears upon removal of the object.

Source of Epidemic

The first diagnosis of a diphtheria case in the Twin Falls epidemic was made as a result of laboratory confirmation after the attending physician had become suspicious of the characteristic

odor of a patient's breath and had taken a culture to prove his diagnosis. Prior to the first confirmed, diagnosed case, a number of membranous septic sore throats, presumed to be streptococcal, had been treated by physicians in the area. This probably accounted for a number of missed cases and is possibly why the epidemic spread so rapidly. Case No. 2 was one of the treated individuals who was the only possible source of infection for several of the later cases, yet a positive culture could not be obtained from her as she had been given treatment with penicillin for a severe "strep" throat which improved rapidly.

Original source of the epidemic was a young child who was the ringbearer at a wedding in Wyoming. A young woman from Twin Falls attended the wedding and slept with this child. The child developed membranous croup and subsequently had a tracheotomy. The young lady returned to Twin Falls and on December 30, 1953, developed diphtheria. This girl and her roommate were both telephone operators who associated with several people in the Buhl area, among whom was Case No. 3.

Cases 1 and 3 infected family members and others, and from there the disease spread rapidly. In addition to the active cases, carriers developed who helped spread the disease even further. Before they became ill or there was a diagnosis made, the carriers and cases attended school, went to church or to their places of employment. Classmates, playmates, friends, and acquaintances—all were exposed. There were sources of infection found linking most of the cases and carriers with their contact. (See tables 1 and 2.)

* had diphtheria in 1940

Since the epidemic went unsuspected for several weeks, widespread exposure took place. As a result the main incidence of the disease took place during February and the epidemic continued through March 10 when the last case was reported.

Control Measures

Epidemiologic investigation indicated widespread infection in the community as indicated by an increasing incidence in cases confirmed by laboratory studies and by the number of carriers discovered by taking cultures on all known contacts of diagnosed cases.

School records indicated a low level of immu-

nizations in the area. In view of these facts, a mass immunization program was considered to be the best method for bringing the outbreak under control.

Needless to say, near panic developed in the area when an epidemic was reported. The local health department facilities were opened during the daylight hours for immunization. Doctors' offices in every instance were crowded with people waiting to be immunized. Volunteer workers were organized to handle the large crowds of people, keep records, and clean equipment. Nurses and physicians' teams held clinics in the schools, and in a matter of a few days a majority of the people had rceceived at least one immunizing injection.

Due to the length of time it took to control this epidemic, and to continuing publicity, most adults returned for the second shots and many for the third. All school children received boosters or the complete series. From the large number of adults and young people appearing for injections, and from the school records available, it was evident that no satisfactory immunization program had been carried on with the exception of one small community school. This school had an excellent pre-school immunization record and, although all of these children and their parents were in close contact with both carriers and cases of diphtheria, no cases developed within this group. Approximately 35,000 people in Twin Falls and surrounding counties were immunized.

Laboratory Studies

Epidemiologic data were obtained from each reported case. Throat and nasopharyngeal swabs were obtained from each patient, his family and intimate contacts. Swabs were planted on Loeffler's medium and incubated overnight. Smears were made for microscopic studies and suspicious (presumptive positive) cultures were transferred to blood tellurite medium. Colonies resembling *C. diphtheriae* were transferred to Loeffler's and incubated overnight. Pure cultures thus obtained, which were morphologically typical of *C. diphtheriae* (confirmed positives) were transferred to broth cultures and tested for virulence in chicks. Isolates were also forwarded to the communicable disease center laboratory in Chablee, Georgia, for typing. All positive cultures were found to be virulent and of the Gravi's type.

Comment

Despite the steady decline in the incidence of diphtheria in the United States during the past few decades, changes in incidence and pattern of the disease require changes in concepts, and pose problems in prevention.

In the United States, from a three-year average of 60.3 cases per 100,000 population for 1929-1931, the rate dropped to an average of 3.9 for the period of 1945-1951. In 1953 the rate was 1.5.

With diminished incidence, there occurs diminished spontaneous immunization. Lack of exposure to the disease requires reconsideration of the duration of immunity under circumstances where contact with natural infection does not occur. Thus, one might expect increasing susceptability with age, a rising age rate in cases and less transplacental immunity conferred to the newborn. With diminished incidence, diagnosis is impeded by a lowered level of suspicion on the part of the clinician. There likewise results a lowering of technical proficiency on the part of bacteriologists and technicians whose skills become rusty through disuse and decreased emphasis on technical training and knowledge.

With the absence of cases in a community, public concern is lessened and demand for immunization tends to drop.

Despite the marked decline, which relegated diphtheria to the position of a rare disease of minor importance, the threat of its recurrence in epidemic form should not be treated lightly.

2300 Central Avenue (Dr. Reinstein).

Dr. Reinstein is State Epidemiologist and Director of Preventive Medicine, Wyoming Department of Public Health. At the time of this investigation, he was Epidemic Intelligence Officer of Communicable Disease Center, U. S. Public Health Service and conducted this study at the request of Mr. L. J. Peterson, Idaho State Health Officer. Mr. W. W. Benson is Director of the Division of Vital Statistics, Idaho State Health Department. Epidemiologic studies and control activities were made possible through the cooperation of the Idaho State Department of Public Health, the Communicable Disease Center, Atlanta, Georgia, and the South Central District Health Department, Twin Falls, Idaho.

Radiologic detection of Meckel's diverticulum, prior to surgical intervention, is a medical experience recorded 22 times in the literature.[1] Our case of presurgical diagnosis of this anomaly is added to those already reported and is, so far as we can determine, a unique event in medical annals of the Northwest.

Historical Background

Fabricus[2] described what is known as Meckel's diverticulum in 1598. Meckel, Professor of Anatomy and Physiology, University of Halle (1781-1833), was not the first to describe the diverticulum which bears his name, nor the first to suggest its origin, but was the first to carefully study the anomaly and write extensively on the topic, according to Sloan.[3]

Zenker, 1861, is credited with establishing relation between gastric mucosa in Meckel's diverticulum and clinical gastrointestinal tract hemorrhage.[4]

Incidence

Meckel's diverticulum is found in 2 per cent of the population (autopsy figures) and 20 per cent of these develop clinical signs and symptoms. The condition is several times more common in males than in females. Baker and Marshall report 93 Meckel's diverticulums in 86,000 intraabdominal operations at the Lahey Clinic or about 1 in 1,000.[4] These writers feel the condition should be sought more often at surgery and removed prophylactically. Age incidence quoted by Sloan is from 7 to 74.

Meckel's diverticulum is clinically most important of the several congenital malformations resulting from varying degrees of failure in normal obliteration of the omphalomesenteric duct. If typical, it should be on the antimesenteric border of the bowel, average approximately 3.5 cm. in length, be 80 to 85 cm. from ileocecal valve, with mucosa which is ileal or gastric in type. It should have its own blood supply and should contain all layers of bowel.

Symptoms and Signs

Symptoms and signs of Meckel's diverticulum are due to the complications relating to the extent of disturbed anatomy and physiology occurring in the diverticulum itself or in surrounding ileum, or both.

Rectal bleeding due to peptic ulceration is the leading clinical manifestation and was a sign in 6 of 19 clinically significant cases at Johns Hopkins Hospital during the period 1931 to 1950. Bleeding can be severe, is often intermittent and, if gross in type, may produce dark red or tarry stool. Five of Sloan's 6 bleeding cases showed peptic ulceration of gastric type mucosa.

Obstruction of the ileum, acute or subacute type with or without volvulus, is a leading symptom. It was manifest 6 times in Sloan's 19 cases. Frequently obstruction was produced when a loop of small bowel herniated through the ring created by adhesion of tip of the diverticulum to adjacent structures.

Intussusception occurred in 4 of Sloan's 19 cases.

Inflammatory change with or without perforation was found in 3 of Sloan's 19 cases. It may simulate appendicitis.

Foreign bodies, particularly fish bones, may cause perforation of a Meckel's diverticulum.

Malignant degeneration has been found.[5,6]

Radiologic Signs

Pfahler is generally credited with the first successful radiologic demonstration of Meckel's diverticulum.[7]

Contrast filling of the diverticulum with barium, usually by small bowel study, has been the most common method of successful radiologic demonstration.

Lerner reports successful detection of a Meckel's diverticulum by the demonstration of a gas-filled pouch.[8]

Stone formation, with folded-ribbon shaped concretion within the diverticulum, was demonstrated in Bischoff and Stampfli's case.[9]

Barium enema as an emergency procedure for demonstration of suspected intussusception was used in 2 of Sloan's 4 cases of intussusception.

Alvary states the anomaly most often gives angulation of the ileum at its point of attachment.[10]

The barium-filled pouch usually is located in lower abdomen to the right of the midline. Peristalsis, due to the presence of all bowel layers, has been observed with careful fluoroscopy and should be sought for as a sign of a true Meckel's diverticulum. Difficulties in radiologic diagnosis are due to wide opening, lumen comparable to adjacent barium-filled small bowel, and young age group of many patients.

CASE REPORT

A 38 year old female was first hospitalized Dec. 14, 1954, because of dark chocolate brown stools, weakness and general malaise for six to seven weeks. The patient recalled that she had had tarry stools for three days in 1948. She also gave history of six weeks period of "colitis" at age of 15 with severe abdominal cramps. She had at times noted epigastric pain four hours following meals. It sometimes awakened her from sleep. She obtained relief from carbonated beverages. Examination was negative except hemoglobin of 35 per cent. She was given 3 pints of blood.

Occult blood test on stools varied between one and two plus.

Fig. 1. Small bowel four hours film showing huge barium-filled Meckel's diverticulum in left abdomen.

Fig. 2. Mobilized small bowel segment and diverticulum.

Fig. 3. Opening of diverticulum as seen in resected specimen.

Barium enema and proctoscopy May 1954 had been negative and were negative on repeat during hospital stay. Upper gastrointestinal series was negative.

She was rehospitalized Aug. 30, 1955, with chief complaint of anemia. After her first hospitalization, hemo-

globin had returned to 80 per cent. There had been no recurrence of bleeding but in the month prior to admission, hemoglobin had gone down to 50 per cent.

Small bowel study Sept. 2, 1955, showed a large barium-filled pouch in the lower abdomen (Fig. 1).

Bowel content obtained at about level of suspected Meckel's diverticulum through Miller-Abbott tube showed strong chemical test for blood.

Operation, with resection of large Meckel's diverticulum, was carried out Sept. 4, 1955 (Fig. 2). The diverticulum measured 10x8 cm., was indurated, and was located 20 cm. from the ileocecal valve. Pathologic diagnosis was a large Meckel's diverticulum with gastric mucosa and chronic active peptic ulceration at one ulcer margin (Fig. 3).

Discussion

Closer teamwork between radiologist and clinician at time of first hospitalization could have established the diagnosis nine months earlier. In 6 of Sloan's 19 cases the diagnosis was suspected on history and physical examination alone.

Since 2 per cent of the population have Meckel's diverticulum and about 25 per cent of these can expect a serious complication, it is important that we develop some way of increasing the diagnostic yield. First, there should be a high clinical index of suspicion. Next, we should know more accurately the diagnostic batting average where there has been clinical suspicion and the radiologist has carried out adequate small bowel examination, including careful fluoroscopy.

The available literature does not accurately reflect how often the above conditions have been fulfilled in rectal bleeding problems otherwise unaccounted for. Neither do we know how frequently Meckel's diverticulum has been considered in differential diagnosis of acute abdomen when there are symptoms indicative of obstruction or perforation. This information would be particularly interesting if elicited from the group having had no prior abdominal surgery.

One of us (AFH) has long been an advocate of a gastrointestinal registry as a cooperative project participated in by general practitioners, surgeons, radiologists and pathologists. Such registry, with its pooled statistical experience, would reveal clinical and radiologic accuracy in diagnosis of the lesion, surgical competence in searching for and removing it, and areas where improvement is needed. Thus the greatest possible efficiency could be employed to establish knowledge of the clinical aspects of Meckel's diverticulum.

Open Fractures

Joe B. Davis, M.D.
Portland, Oregon

The great danger associated with the management of open fractures is the occurrence of infection. Regardless of how accurately or skillfully the surgeon's management of an open fracture is accomplished, it is of no avail if sepsis occurs. The following outline is presented as a guide to reduce the septic complication to a minimum.

Definition

An open (compound) fracture has the fragments in commnication with the skin. These are to be distinguished from simple fracture with superficial laceration.

Etiology

(1) Perforating . . . (Usually less contaminated). The compounding is produced by the fragments rupturing through the skin from within, outward.

(2) Penetrating . . . (Usually more contaminated). The compounding is produced by external direct force (missile, blunt or sharp objects), acting from without, inward.

Peculiarities

Open fractures are of the same types as simple fractures.

Premise of Management

The open fracture is converted to a closed (simple) fracture at as early a time as the bacterial contamination and the wound resistance will allow.

Management of Compounding

(1) Care of Patient . . . (a) splint of fracture for transportation, (b) correction of shock, blood loss and visceral damage.

(2) Preparation of Wound . . . (a) general anaesthesia, (b) shave compound area widely, (c) surgical scrubbing of wound area with soap or detergent, the time varying by the amount of contamination (10 to 30 minutes).

(3) Debridement . . . (a) removal of all avascular and grossly contaminated tissue, (b) irrigation with saline.

Fracture Management

This is determined by the bacterial contamination and the bacteria medium remaining after debridement. It must embody plaster immobilization, antibiotics, and careful general management.

(1) Primary closure with operative fracture management. Rarely does a wound qualify for this management but a few are seen in civilian practice.

(2) Primary closure. This wound is not as healthy as No. 1 and secondary fracture management may be required after the compounding is healed.

(3) Closure with drainage for three to four days. This plan is used in less healthy wounds than No. 2.

(4) Secondary closure after three to ten days. This plan is reserved for wounds that are potentially infected and which require accumulation of local resistance.

(5) Delayed closure with skin substitution. This may be done in markedly contaminated or infected wounds usually with loss of soft tissue.

Summary

An open (compound) fracture should be converted to a simple fracture at as early a time as the bacterial count and the medium of the wound will allow. After this is accomplished, the open fracture can then be managed by the standard principles of fracture management employed in all fractures. The greatest danger in open fractures is the occurrence of sepsis and this must be avoided. The plan as outlined above is intended to avoid this complication. Since open fractures are of the same types as simple fractures, individual management will vary remarkably from simple cast immobilization to complex methods of fixation.

Nilevar®

stimulates protein synthesis,
corrects negative nitrogen balance

Increased nitrogen loss, with resulting negative nitrogen balance, occurs in infection, trauma, major surgery, extensive burns, certain endocrine disorders and starvation and emaciation syndromes. The intrinsic control of protein metabolism is lost and a protein "catabolic state" occurs. A patient requiring more than ten days of bedrest usually has had sufficient metabolic insult[1] to precipitate such a "catabolic" phase.

Nilevar (brand of norethandrolone) has been used in patients with varied conditions including hyperthyroidism, poliomyelitis, aplastic anemia, glomerulonephritis, anorexia nervosa and postoperative protein depletion. The patients gained weight and felt better. It was concluded[2] that "the drug certainly caused a reversal of rather recalcitrant or progressive catabolic patterns of disease."

Nilevar is unique among anabolic steroids in that androgenic side action is minimal or absent.

The suggested adult dosage is three to five tablets (30 to 50 mg.) daily. For children 1.5 mg. per kilogram of weight is recommended.

WIGRAINE®

TABLETS AND SUPPOSITORIES

When taken at the first indication of symptoms, Wigraine tablets and suppositories relieve vascular headaches (e.g., *migraine*) completely. The uncoated Wigraine tablet disintegrates quickly, acts promptly. Wigraine suppositories are useful for those patients who experience nausea and vomiting as an early symptom.

Wigraine combines ergotamine tartrate and caffeine to relieve vascular head pain by vasoconstriction; belladonna alkaloids' antispasmodic action for nausea and vomiting; and the analgesic action of acetophenetidin for residual occipital muscle pain.

Formula: Each Wigraine tablet and suppository contains 1 mg. ergotamine tartrate, 100 mg. caffeine, 0.1 mg. 1-belladonna alkaloids,* and 130 mg. acetophenetidin.

Supplied: Wigraine Tablets, individually foil-stripped and packaged in boxes of 20 and 100. *Wigraine Suppositories,* individually double-wrapped in clear plastic boxes of 12. Send for complete descriptive literature.

A ROCKET TO THE MOON

might be a way stop in man's eventual conquest of space, but continual research will take him even farther. So, too, with the problem of alcoholism. To stop at the end of a successful treatment, considering the task completed, would defeat the fundamental purpose for which an organization such as Shadel exists. The conquering of alcoholism begins, not ends with the successful treatment.

Only constant refinement and development will bring about the ultimate goal of prevention through research. Twenty-three years of research and expansion, seeking to provide the best for the patient and the physician, has been—and is—the goal of Shadel, an organization founded and operated with the aim to aid society in combating a vicious disease.

OREGON STATE MEDICAL SOCIETY
1115 S. W. Taylor Street
Portland 5, Oregon

ANNUAL MEETING
September 3-5, 1958
Portland

President, Vern W. Miller, M.D., Salem
Secretary-Treasurer, Max H. Parrott, M.D., Portland
Executive Secretary, Mr. Roscoe Miller, Portland

Formation of "Key Man" Program Receives State Council Approval

The year 1958 may be termed an "off year" as far as the State Legislature is concerned but there is every indication that it will be a busy 12 months for the State Society's Committee on Public Policy.

Arch W. Diack, chairman, reported to the Council in January on a lengthy committee session that ranged in subject matter from the controversial Forand Bill now before Congress which would further expand Social Security benefits, to the organization of a group of key legislative physicians throughout Oregon.

The Forand Bill providing surgical and hospital benefits for Social Security recipients was unanimously rejected as the Society reaffirmed its position in opposition to Federal medical care programs.

In a positive move, the Committee was authorized to explore the possibility of seeking State legislation which would require medical insurance underwriters to establish a "preferred risk pool" to provide health insurance protection for persons over 65. The Committee also indicated it will study other proposals for medical care for the older age group.

Chairman Diack said the Committee unanimously agreed that, "opposition to the Forand Bill is not enough. We must offer positive proof that medicine can and will find the means to care for our aging population," he said.

The "key man" program is patterned after several other State Medical Society organizations. Under the plan, President Vern W. Miller will appoint a "key man" in each county to serve for two years. Physicians selected will be asked to keep themselves informed on state and federal legislation affecting the practice of medicine or the public health. "Key men" will receive regular mailings of literature concerning such legislation and other public policy matters that might be considered by the Society.

Each year the Society plans to sponsor a state conference for "key men" during which detailed information will be presented on current activities of the Committee on Public Policy.

"Key men" will be expected to become acquainted with their local legislators and to keep their colleagues and other persons in the community informed on the position of the State Medical Society.

On recommendition of the Public Policy Committee the Council also approved the rules and regulations established by the Oregon State Board of Medical Examiners for the licensure of graduates of foreign medical schools, agreed to assign a committee to cooperate with the Board of Health and the Board of Medical Examiners in developing a program to elevate standards of medical care in hospitals, and invited the Legislative Committee of the Woman's Auxiliary to attend the conference for "key men."

Scientific Programs Being Planned For '58 and '59 Annual Sessions

Plans are already well under way for the 1958 and 1959 Annual Sessions of the Oregon State Medical Society.

Max H. Parrott, Secretary-Treasurer of the State Society who also serves as chairman of the Committee on Annual Session, reported to the Council in January that the scientific program is now being considered for the '58 Session which will be held in Portland, September 3-4-5, starting on the Wednesday immediately following Labor Day. The early date was selected to avoid conflict with the hunting season.

In 1959 the Session moves out of Portland for the first time in eight years and will be held in Medford with members of Jackson County Medical Society serving as official hosts.

Dr. Parrott is making arrangements to establish a liaison group from the Jackson County Medical Society to his Committee for the purpose of coordinating the Session's scientific, business and recreational programs. Tentative plans for the Medford meeting include use of the city's expansive new armory for scientific lectures and technical exhibits. The House of Delegates is scheduled to convene at the modern Rouge Valley Country Club just a few minutes drive from the armory.

Four Physicians Given Life Memberships

Four long time and well-known physicians have been added to the roster of Life Members of the Oregon State Medical Society.

Approved as Life Members at the January meeting of the Council were H. R. Lucas, George Earle Henton and Harry B. Moore, Portland, and E. J. Nitschke of Prairie City.

All physicians who have been active members in good standing of the Society for 30 years and who have reached the age of 65 are eligible to apply for Life Membership.

Eligible members desiring Life status should apply in writing to the Secretary-Treasurer, Max H. Parrott, at the headquarters office.

Members Receive "Statement of Minimum Employment Practices for Office Nurses"

Oregon physicians will soon receive from their State Medical Society a copy of a new "Statement of Minimum Employment Practices for Office Nurses" as adopted and published in October, 1957, by the Oregon Nurses Association.

Although the "Statement" carries neither the endorsement nor disapproval of the Society, the State Council approved a recommendation of its Liaison Committee to the Oregon Nurses Association that the pamphlet be forwarded to all physicians for informational purposes only.

The "Statement" suggests general employment conditions including wages, hours, holidays and paid vacations.

Melvin W. Breese, Chairman of the Liaison Committee, reported that the "Statement" represents the office nurses' opinion of what constitutes proper minimum employment conditions. He emphasized the Committee is interested in helping the nurses improve their personal and professional status.

A second recommendation adopted by the Council authorized the Committee to launch a program aimed at stimulating more physician participation in formal postgraduate training of nurses in all classifications.

Presidents of medical staffs, superintendents of nurses and presidents of component medical societies will be urged to establish formal training programs in local hospitals. Lectures and demonstrations by physicians would be open to nurses employed in hospitals, industry and medical offices as well as qualified nurses not currently employed.

The following report of the Liaison Committee of its actions at a meeting on December 13, 1957, was adopted by the Council at the January session:

1. *The "Statement of Minimum Employment Practices for Office Nurses in Oregon" adopted by the Oregon Nurses Association in October 1957.*

The Committee recalled that the establishment of such standards had been considered at three joint meetings with representatives of the Association's Office Nurse Section.

It was also recalled that the Committee had presented to the Council on October 6, 1956, a recommendation that it consider approving the "Standards" as revised by the Committee but that the Council, however, referred the matter back to the Committee for further study.

The Committee then reviewed the "Standards" as adopted and published by Oregon Nurses Association and voted to recommend to the Council that the "Standards" be mailed to each member of the Society with a letter of transmittal which would simply state that the Committee feels office nurses should be adequately compensated and that the "Standards" represent the nurses' opinion regarding what constitutes proper minimum employment conditions for office nurses. The Committee wishes to emphasize its desire to help the nurses to improve their personal and professional status.

The Committee, also, voted to suggest that the Oregon Nurses Association mail the "Standards" to the office nurses at the same time the Society mails them to its members.

2. *Postgraduate Education for Nurses.*

The Committee was strongly of the opinion that physicians should assist nurses in advancing their professional qualifications by offering postgraduate education opportunities wherever nurses would like postgraduate training.

It, therefore, voted to recommend that postgraduate education courses be offered by the medical staffs of local hospitals in conjunction with nursing departments in the hospitals.

The Committee suggests that letters recommending the inauguration of the program be sent to the presidents of the medical staffs and the superintendents of nurses at each hospital in the State and to the presidents of each component society. This is an effort to show the nurses of Oregon that we willingly offer our services for postgraduate training for nurses. Inactive nurses should be invited also wherever possible.

3. *Nursing Schools in Oregon.*

The Committee had brought to its attention that all schools of nursing outside of Portland, except the school at the Sacred Heart Hospital in Eugene, had been discontinued and that many nurses training applicants had been denied admission to Oregon schools of nursing in recent years. In view of the shortage of nurses, the Committee considered this situation to be unfortunate.

The Oregon Nurses Association has informed the Committee that schools in smaller hospitals had been discontinued because they cannot offer a sufficiently broad nursing experience, cannot obtain or maintain adequate faculty, and find it financially difficult to support these smaller schools. The Committee is continuing its study of this problem.

4. *Survey of Nursing Needs in Oregon.*

A survey of "The Needs for Nursing Services in Oregon" was conducted in 1948 by a combined committee of professional and lay people interested in patient care, and plans are being considered to repeat this survey to determine what progress has been made and what the future needs may be.

The Committee recommends recognition of this proposed re-survey and that active financial support be considered.

Respectfully submitted,
Melvin W. Breese, M.D., Chairman
Hugh D. Colver, M.D.
Bruce L. Titus, M.D.

UOMS Receives Two Research Grants

Two $15,000 grants were awarded to the University of Oregon Medical School during December. One was given for research in diseases of the eye and the other to support cancer research.

The $15,000 given to the University by the Knights Templar Eye Foundation, Inc., is being used to support research programs underway in the John E. Weeks Memorial Laboratory of Ophthalmology. Two University investigators were the recipients of the gift from the Damon Runyon Memorial Fund which was presented to the medical school by U.S. Senator and Mrs. Richard L. Neuberger of Oregon, representing the fund. The Senator was asked to make the award because of his sponsorship of cancer research legislation in Congress.

Lederle LEDERLE LABORATORIES DIVISION, AMERICAN CYANAMID COMPANY, PEARL RIVER, NEW YORK

Three Physicians Nominated For Appointment to Medical Board

Governor Robert D. Holmes has received the nomination of three physicians from the Oregon State Medical Society for consideration in making a five-year appointment to the State Board of Examiners.

The State Council at its January meeting waived policy on request of the House of Delegates and nominated Wilmot C. Foster, the incumbent who will complete his second term on the Board on February 28.

Also nominated were A. O. Pitman, Hillsboro, and Melvin W. Breese, Portland. Dr. Pitman, a past president of the Society, is serving as the Society's senior delegate to the American Medical Association. Dr. Breese is chairman of the Society's Liaison Committee to the Oregon State Nurses Association.

Society policy prohibits the nomination of any physician who has served two full consecutive terms on the Board. However, last fall the House of Delegates voted to relax policy in Dr. Foster's instance so that in event he is re-appointed to the Board, Dr. Foster will be able to retain his position as a member of the Executive Committee of the National Federation of State Medical Boards. Dr. Foster is the only physician residing in a west coast State now serving on the Board's Executive Committee. All members of the National Executive Committee must be members of their own State Board.

The new term on the State Board of Medical Examiners will expire on February 28, 1963.

Dates Set for Mid-Year Meeting

Adoption of the budget for 1958 and approval of dates for the mid-year meeting of the House of Delegates were among actions taken by the Council of the Oregon State Medical Society at its January meeting.

Dates for the mid-year meeting to be held in Portland were approved for Saturday and Sunday, April 19-20, immediately following annual meeting of the University of Oregon Medical School Alumni Association. Sessions will be held at the Columbia Athletic Club.

The budget as adopted will be mailed to all members of the Council.

The Council also heard a special report from Raymond M. McKeown of Coos Bay, who is now serving as a Trustee of the American Medical Association. Dr. McKeown reported on highlights of the Trustee meetings during the recent clinical session in Philadelphia.

Klamath County Medical Association

William Holford, Jr., was elected and installed as president of the Klamath County Medical Association at the group's December meeting. Other officers chosen to serve during 1958 were: John D. Merryman, vice-president; Robert Payne, secretary; Everett E. Howard, treasurer; and Fletcher Conn and Don Rice, delegates. All practice in Klamath Falls.

Douglas County Medical Society

Robert R. Mooers has been elected to the top post of the Douglas County Medical Society for 1958. Others named to serve with Dr. Mooers during the current year are: George Lenci, vice-president; William D. Holst, secretary-treasurer; and Harvey W. Kring, councilor. All are Roseburg physicians.

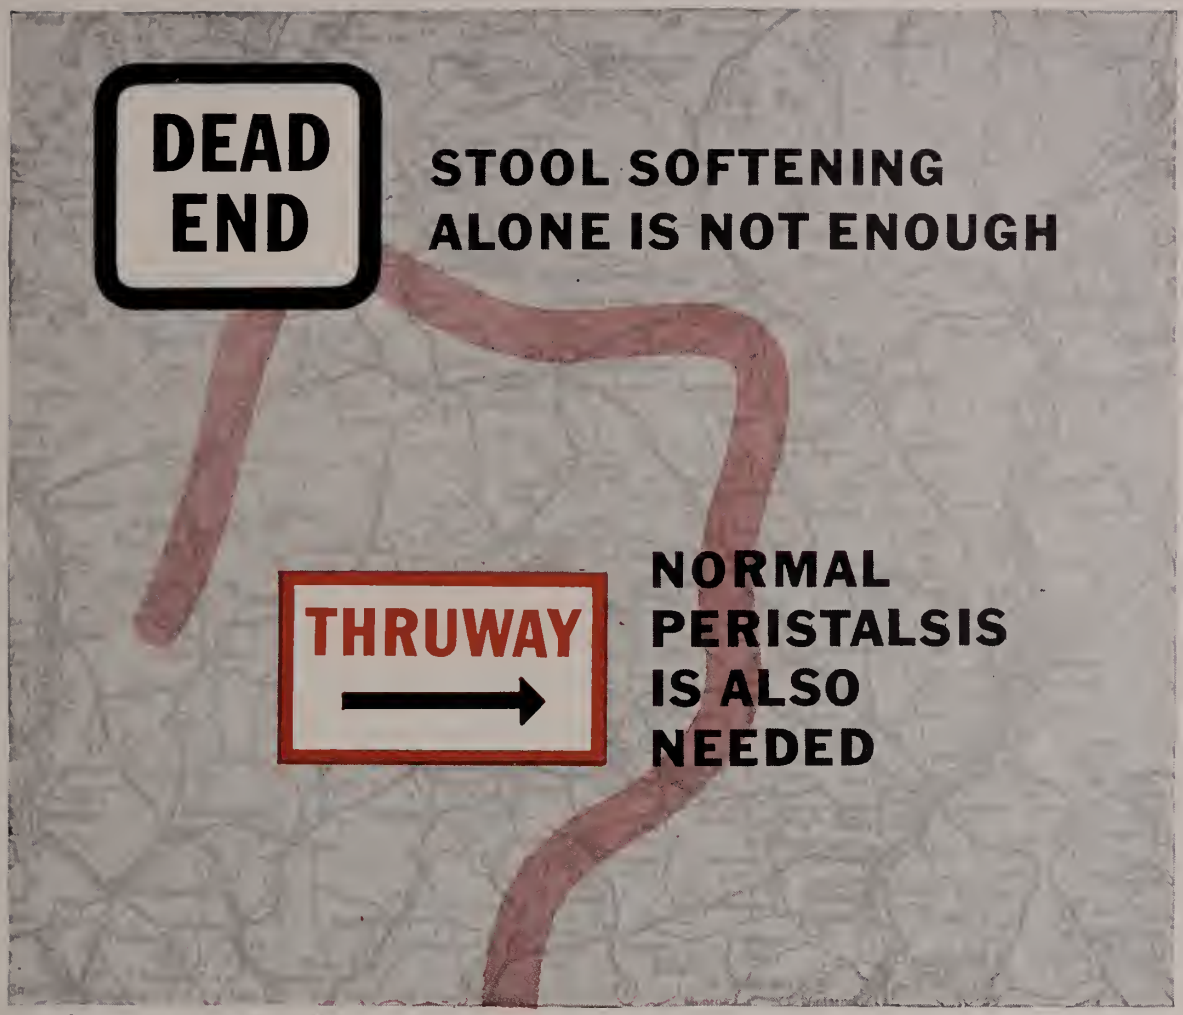
UOMS Sponsors Monthly Research Forums

A monthly series of research forums sponsored by the University of Oregon Medical School were initiated during the past year. The programs enable professional people in the Portland area to learn about advances in various fields of the medical sciences. Three papers are presented at each meeting which is preceded by an optional dinner. Inquiries as to date and time of meetings should be addressed to: Division of Endocrinology, University of Oregon Medical School, Portland 1.

Sommer Advisory Committee Post Filled

Arthur L. Rogers of Portland has been appointed to the advisory committee for the Sommer memorial lectures. Dr. Rogers succeeds the late John Fitzgibbon of Portland.



The Sommer lectures are held each spring and fall, in conjunction with the University of Oregon Medical School Alumni meeting and the annual convention of the Oregon State Medical Society. Internationally known specialists from all parts of the world have appeared on Sommer lecture programs, which are made possible through a trust fund established by the late Ernst Sommer.

Southwestern Oregon Medical Society

Paul Parker of North Bend has been elected to succeed Donald Courtney, Reedsport, as president of the Southwestern Oregon Medical Society. Other officers elected during the December meeting were: William P. Kean, Coos Bay, vice-president; Douglass Johnson, Coos Bay, secretary-treasurer; Dr. Courtney, delegate; Ellsworth Lucas, Bandon, and Elmo Peterson, North Bend, members of the Society's executive council; and L. B. Gould, Coquille, local advisor to the board of the Oregon Physicians Society.

Obituary

Dr. Walter C. Miller, 61, died November 29 at his home in Portland. Dr. Miller received his medical degree in 1920 from the University of Nebraska College of Medicine. He served his internship at St. Joseph Hospital in Denver, Colo., and practiced in Alamosa, Colo., and Arapahoe, Neb., before locating in Portland. He had practiced in Portland for 19 years and was a staff member of Emanuel Hospital.

Aquatyl®

a natural peristaltic stimulator with effective stool softening action

restores normal bowel physiology to provide normal, lasting correction of constipation. Each Aquatyl tabule contains 50 mg. dioctyl sodium sulfosuccinate and 100 mg. cholic acid. Dioctyl sodium sulfosuccinate safely softens the stool . . . cholic acid, an elemental body constituent, sparks natural peristalsis and a return to normal evacuation.

Dosage: Initially, two or three tabules with a full glass of water 3 times daily for three days. Maintenance therapy, usually 1 or 2 tabules daily.

President, Milo T. Harris, M.D., Spokane Secretary, F. A. Tucker, M.D., Seattle Executive Secretary, Mr. R. W. Neill, Seattle

High Court Decision Validates Disciplinary Act

Test of the Medical Disciplinary Act of 1955 resulted in firm support of powers of the Medical Disciplinary Board by the Supreme Court of the State of Washington. Following is full copy of the decision handed down January 2, 1958:

IN THE SUPREME COURT OF THE STATE OF WASHINGTON

In the Matter of the Revocation of the License to Practice Medicine and Surgery of JEAN D. KINDSCHI.	Filed January 2, 1958 No. 34137 Department One

Dr. Kindschi's license to practice medicine and surgery in the state of Washington was suspended for eight months by the medical disciplinary board for alleged unprofessional conduct as defined in RCW 18.72.030(1). He appealed to the superior court for Thurston County, which affirmed the suspension. The matter is now before us for review.

The medical disciplinary board was established by the state legislature in 1955. It was given broad powers to discipline members of the medical profession for unprofessional conduct. It may reprimand a doctor, or may suspend or revoke his license. Unprofessional conduct is defined in RCW 18.72.030. The portions thereof pertinent to this appeal read as follows:

> . . . The term 'unprofessional conduct' . . . shall mean . . .
> (1) Conviction in any court of any offense involving moral turpitude, in which case the record of such conviction shall be conclusive evidence.

On May 4, 1956, Dr. Kindschi entered a plea of guilty in the United States District Court for Eastern Washington to a charge of willfully attempting to evade a portion of his proper income taxes for the calendar year, 1949, *by filing a false and fraudulent return.*

The charge involved violation of 145(b) of the internal revenue code of 1939, as amended, which reads as follows (p. 221):

> (b) . . . Any person . . . who willfully attempts in any manner to evade or defeat any tax imposed by this chapter or the payment thereof, shall, in addition to other penalties provided by law, be guilty of a felony . . .

On August 17, 1956, the medical disciplinary board issued notice to Dr. Kindschi that a hearing would be held on September 22, 1956, in Seattle to determine whether his license to practice medicine should be revoked. In its specification of charges the board set out the above-mentioned conviction of tax evasion and charged that the offense involved moral turpitude, and constituted unprofessional conduct within the meaning of the medical disciplinary act.

Dr. Kindschi made timely written reply to the specification. He admitted pleading guilty to the Federal offense, but denied that it involved moral turpitude or constituted unprofessional conduct.

When the hearing committee of the medical disciplinary board convened, the chairman announced (a) that it was the opinion of the attorney general of the state of Washington that the crime for which Dr. Kindschi had been convicted involved moral turpitude; and (b) that the opinion of the attorney general fully settled the question insofar as the board was concerned. The chairman specifically foreclosed any hearing on the question, and counsel have stipulated that no evidence was taken at the hearing concerning the facts and circumstances involved in the violation by Dr. Kindschi of the internal revenue act.

It is somewhat difficult to classify a medical disciplinary proceeding. It is characterized as civil, not criminal, in nature; yet it is quasi criminal in that it is for the protection of the public, and is brought because of alleged misconduct of the doctor involved. Its consequence is unavoidably punitive, despite the fact that it is not designed entirely for that purpose. It is not strictly adversary in nature. It is essentially a *special*, somewhat unique, statutory proceeding, in which the medical profession (under state authorization through the medical disciplinary board) inquires into the conduct of a member of the profession and determines whether disciplinary action is to be taken against him in order to maintain sound professional standards of conduct for the purpose of protecting (a) the public, and (b) the standing of the medical profession in the eyes of the public. *Cf. In Re Little*, 40 Wn. (2nd) 421, 244 P. (2nd) 255.

It may be argued that, since it is not strictly a criminal proceeding, the principles of due process and equal protection (guaranteed by the fourteenth amendment) do not apply. On that question, however, the United States Supreme Court is the final arbiter, and in a recent opinion (*Schware v. Board of Bar Examiners of New Mexico* (1957), 353 U. S. 232, 1 L. Ed. (2nd) 796, 77 S. Ct. 752), that court stated:

> A State cannot exclude a person from the practice of law or from any other occupation in a manner or for reasons that contravene the Due Process or Equal Protection Clause of the Fourteenth Amendment . . .

(Continued on page 222)

An article on the Medical Disciplinary Board and the way it functions will be published next month.

(Continued from page 221)

(citing cases). A State can require high standards of qualification, such as good moral character or proficiency in its law, before it admits an applicant to the bar, but any qualification must have a *rational connection with the applicant's fitness or capacity to practice law* . . . (Emphasis supplied.)

In the *Schware* case, *supra,* the court was dealing with *admission* to practice *law;* but it follows, logically, that the due process clause and the equal protection clause of the fourteenth amendment apply with much force to proceedings in which a practitioner's license may be *revoked or suspended.* The following footnote in the *Schware* opinion, *supra,* emphasizes this view:

> We need not enter into a discussion whether the practice of law is a 'right' or 'privilege.' Regardless of how the State's grant of permission to engage in this occupation is characterized, it is sufficient to say that a person cannot be prevented from practicing except for valid reasons. Certainly the practice of law is not a matter of the State's grace. *Ex Parte Garland,* 4 Wall. 333,379.

The United States Supreme Court has not required that due process and equal protection standards relative to criminal trials are *necessarily entirely* applicable to disciplinary proceedings relative to state granted licenses to practice professionally.

RCW 18.72.030 (1) prescribes as unprofessional conduct "conviction in any court of any offense involving moral turpitude." Tax fraud involves moral turpitude. *Jordan v. DeGeorge, infra; In Re Seijas, 151* Wash. Dec. 350, ____ P. (2d)____. In our judgment, a willful and intentional attempt to avoid payment of all or a part of one's income tax with intent to defraud the government involves moral turpitude. Such fraud is unprofessional conduct as that term is defined in the medical disciplinary act.

The daily practice of medicine concerns life and death consequences to members of the public. They have an understandable interest in the maintenance of sound standards of conduct by medical practitioners. The public has a right to expect the highest degree of trustworthiness of the members of the medical profession. We believe there is a rational connection between income tax fraud and one's fitness of character or trustworthiness to practice medicine, so that the legislature can properly make fraudulent conduct in such instances a ground for revoking or suspending the license of a doctor.

Dr. Kindschi was charged with violating a Federal criminal statute. We look, therefore, to the decisions of the Federal courts to discern the elements necessarily involved in the crime to which he pleaded guilty.

There is some conflict and some doubt under the decisions of the Federal courts as to whether fraud (moral turpitude) inheres in every violation of 145(b). See concurring opinion in *In Re Seijas, supra.* But there is no doubt under the Federal cases that fraud must be proved when the method of defeating or evading tax alleged in an indictment is by the filing of a false and fraudulent income tax return. *Berra v. United States* (1955), 351 U. S. 131, 100 L. Ed. 1013, 76 S. Ct. 685; *Achilli v. United States* (1957), 353 U. S. 373, 1 L. Ed. (2d) 918, 77 S. Ct. 995; *United States v. Rosenblum* (1949, CA 7th), 176 F. (2d) 321; *United States v. Raub* (1949, CA 7th), 177 F. (2d) 312; *Norwitt v. United States* (1952, CA 9th), 195 F. (2d) 127.

The method of tax evasion charged in the indictment of Dr. Kindschi was that of filing false and fraudulent returns. He pleaded guilty to that charge. We hold that the issue of fraud (moral turpitude) was determined conclusively by his plea of guilty to the crime as charged. He has no right to a new hearing before the medical disciplinary board as to the presence or absence of moral turpitude in his violation of 145(b). The summary proceedings by the medical disciplinary board were appropriate in the instant case.

One further point merits discussion. Appellant has challenged the moral turpitude standard as too vague in cases such as this, where different opinions may exist as to the presence or absence of moral tupitude in the crime committed. In *Jordan v. DeGeorge* (1951), 341 U.S. 223, 95 L. Ed. 886, 71 S. Ct. 703, the United States Supreme Court stated:

> We have several times held that difficulty in determining whether certain marginal offenses are within the meaning of the language under attack as vague does not automatically render a statute unconstitutional for indefiniteness . . . Impossible standards or specificity are not required . . . (Citing cases). The test is whether the language conveys sufficiently definite warning as to the prescribed conduct when measured by common understanding and practices . . . (Citing cases).
>
> We conclude that this test has been satisfied here. Whatever else the phrase 'crime involving moral turpitude' may mean in peripheral cases, the decided cases make it plain that crimes in which fraud was an ingredient have always been regarded as involving moral turpitude. We have recently stated that doubt as to the adequacy of a standard in less obvious cases does not render that standard unconstitutional for vagueness . . .

We think the foregoing quotation disposes of appellant's void-for-vagueness contention.

This court has the responsibility for disciplining its members of the legal profession. In the case of *In Re Seijas, supra,* we disbarred a lawyer for Federal income tax fraud. In contrast, in the instant case, the medical disciplinary board suspended a doctor from the practice of medicine for eight months. In terms of the protection of the public through disciplinary proceedings in matters of professional conduct, we can see no difference in income tax fraud—whether it is perpetrated by a lawyer or a doctor. We have no authority over the disciplining of members of the medical profession for unprofessional conduct. If the disciplining of the doctor by the medical disciplinary board in the instant case seems mild, the responsibility for this must be assumed by the medical disciplinary board. The legislature has vested authority and complete responsibility in the medical disciplinary board in such matters.

The judgment of the trial court is affirmed.

NOTHING IS QUICKER • NOTHING IS MORE EFFECTIVE

Medihaler-EPI®

For quick relief of bronchospasm of any origin. More rapid than injected epinephrine in acute allergic attacks.

Epinephrine bitartrate, 7.0 mg. per cc., suspended in inert, nontoxic aerosol vehicle. Contains no alcohol. Each measured dose 0.15 mg. actual epinephrine.

Medihaler-ISO®

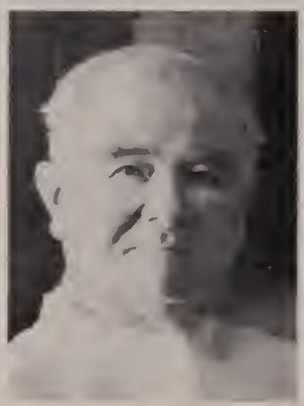
Unsurpassed for rapid relief of symptoms of asthma and emphysema.

Isoproterenol sulfate, 2.0 mg. per cc., suspended in inert, nontoxic aerosol vehicle. Contains no alcohol. Each measured dose 0.06 mg. actual isoproterenol.

Prescribe Medihaler medication with Oral Adapter on first prescription. Refills available without Oral Adapter.

Medihaler-Phen®

Automatic NASAL aerosol nebulization provides prompt, effective, prolonged, and nonirritating decongestion in head colds, allergic rhinitis, sinusitis, and nasopharyngitis. Vasoconstrictive, decongestive, anti-inflammatory, antibacterial. Combines actions of phenylephrine, phenylpropanolamine, neomycin, and hydrocortisone.



FOR KIDDIES TOO
Notably safe and effective for children.
Nonbreakable, spillproof.

Riker LOS ANGELES

S. Maimon Samuels Donates Gift to UW For Heart and Cancer Research Lab

Dr. and Mrs. S. Maimon Samuels have donated a gift of $100,000 to the University of Washington for construction of a heart and cancer research laboratory. In accepting the gift, the University's Board of Regents presented a certificate of appreciation to the couple.

S. Maimon Samuels, M.D.

Dr. Samuels, a Seattle physician since 1909, has stated that he plans to increase his contribution to about $250,000 in the near future.

The new research laboratory will be named the Dr. S. Maimon Samuels Institute for Heart and Cancer Research and will be a part of the University's Division of Health Sciences.

This present gift is just one of several made by Dr. and Mrs. Samuels to medical projects in Seattle. The property on which the King County Central Blood Bank is constructed was donated by the couple in 1944. In 1950 and 1952, they gave $12,000 to the University for production of a film on congenital malformations of the heart. Produced by Robert Rushmer of the University's medical school faculty, the motion picture has attained international prominence.

Grant Given in Medical Teaching Field

A $200,000 grant from the National Institutes of Health for experiment with new methods of attracting young people to become medical teachers and researchers has been awarded to the University of Washington School of Medicine. The University of Washington was one of six medical schools in the nation selected to receive such a grant.

Premedical students received research fellowships last summer under the new grant, which is to be used over a five-year period. Other projects under consideration are a conference for premedical advisors in Pacific Northwest colleges and universities, and a plan which would enable medical students who are interested in teaching to drop out of the regular curriculum for a quarter or more to gain experience as laboratory instructors.

Clark County Medical Society

Regular monthly meeting of Clark County Medical Society was held at the Royal Oaks Country Club on Tuesday evening, January 7. This meeting was a joint dinner meeting with the Woman's Auxiliary.

Following dinner and social hour, the group heard Charles T. Duncan, Dean of the School of Journalism at the University of Oregon, talk on Public Relations in Medicine.

Mr. Ray Bachman, Editor of the *Vancouver Columbian*, and Mrs. Bachman, and Mr. Kenneth Rystrom, a reporter on the *Columbian*, were other invited guests.

PRESIDENTIAL VISITATION—President Milo T. Harris of Washington State Medical Association (center) was guest speaker at a dinner meeting of doctors and lawyers in Okanogan County December 14. Shown with him are J. E. Fischnaller of Omak (left), president of Okanogan County Medical Society, and Mr. Charles A. Johnson of Okanogan, president of the Okanogan County Bar Association. Dr. Harris spoke following a showing of the film, "The Doctor Defendant," and led a discussion of medico-legal problems.

Ophthalmologists and Otolaryngologists Meet

Annual President's Meeting of Puget Sound Academy of Ophthalmology and Otolaryngology was held January 11 at the Rainier Club in Seattle. Lester T. Jones, Clinical Professor of Otolaryngology at the University of Oregon Medical School, was guest speaker. He presented two lectures: Congenital Anomalies of the Lacrimal Apparatus and Their Treatment, and Surgery for Complicated Conditions of the Lacrimal Apparatus.

At the close of the meeting, retiring president DeMar Anderson of Seattle presented the president's gavel to Edison G. Dorland, Seattle, president for 1958. New officers elected at the meeting were: Willard Goff, Seattle, president-elect; James L. Hargiss, Seattle, secretary-treasurer, and George Drumheller, Everett, trustee.

Five new members received certificates of fellowship in the Academy.

UW Receives Grants from DuPont Co.

University of Washington has been selected as one of 135 universities and colleges to participate in grants given by the E. I. DuPont DeNemours and Co. to aid education. The DuPont program of grants for the next academic year totals nearly $1,150,000.

The two awards made to the University are a grant of $10,000 for fundamental research in chemistry during 1958-59 and a postgraduate teaching assistantship in chemistry. The assistantship grant provides $2,400 for the year for the appointee with an additional allowance of $600 if he has children, plus an award of $500 to the University, and payment of tuition and fees.

Snohomish County Medical Society

Kenneth Barnes of Marysville was elected president of Snohomish County Medical Society during the group's January meeting. Named to serve with Dr. Barnes for the current year were J. William Ebert, Jr., vice-president, and James Otto, secretary-treasurer, both of Everett.

During the joint meeting with Everett Safety Council, members heard a discussion of the medical-legal aspects of heart diseases in industry. Sam Aronson and Donal Sparkman of Seattle were guest speakers.

Herbert Moseley To Be Speaker At Seattle Surgeons Annual Meeting

Those attending the Annual Dinner and Clinics of the Seattle Surgical Society March 21 and 22 at the Olympic Hotel will hear a wide variety of papers on surgery of acute trauma and two formal lectures by guest speaker Herbert F. Moseley, Assistant Professor of Surgery at McGill University Faculty of Medicine. The Society extends an open invitation to all members of the medical profession to attend the sessions.

HERBERT F. MOSELEY, M.D.

Well-known as an author as well as a teacher, Dr. Moseley has written textbooks on surgery and orthopedics, and also numerous articles. His most recent volume is entitled The Forequarter Amputation and was published in 1957 by the Livingstone Co., Edinburgh, England. Titles of the five films which Dr. Moseley has made are: Calcified Deposits in the Rotator Cuff (1948), Ruptures of the Rotator Cuff (1949), Anterior Dislocations of the Shoulder (1949), Surgical Anatomy of the Shoulder (1949) and Inferior Relations of the Shoulder Joint (1950). These films were made available through Davis & Geck.

Dr. Moseley will lecture on the shoulder—his work on which has been recognized with several special honors, including a medal presented last year on the occasion of his visit to the University of Ghent as guest speaker. His first paper, Rupture of Rotator Cuff of the Shoulder, will be presented at 2:00 p.m. Friday, March 21, immediately following lunch. Dr. Moseley's second talk, Special Operative Treatment of Recurrent Dislocation of the Shoulder, will be given at 11:40 a.m. Saturday, March 22, and will close the meeting.

Subjects to be discussed during the two-day session are: renal trauma, shock, vascular trauma, crushing injuries of the chest, cardiac tamponade, peripheral nerve injuries, litigation, facial skeletal injuries, burns, intermedullary nailing of shaft fractures, "rear end collision" neck sprains, pitfalls in repair of eyelid injuries, hand injuries, nonpenetrating lesions of the abdomen, trauma to the larynx, and acute and subacute subdural hematomas. Dr. Moseley will discuss the papers presented.

A panel discussion on Care of the Patient with Multiple Injuries, moderated by Dr. Moseley, will open the Saturday session, immediately following the breakfast meeting at 8:00 a.m. The banquet will be held Friday evening. A formal invitation is not necessary to attend the Clinics, the Dinner or the Breakfast.

Clyde L. Wagner and Robert E. Florer of Seattle are in charge of program arrangements.

Correction:

News story appearing on page 93 of the January 1958 issue was incorrectly entitled, American College of Surgeons to Meet January 17 in Seattle. Title should have read as follows: American College of Physicians to Meet January 17 in Seattle.

LEFT: Milo T. Harris, President of WSMA, and C. D. Hogenson, President of the Walla Walla Valley Medical Society. RIGHT: Robert A. Campbell, newly-elected President of the county society.

Proposed Dues Increase Discussed By President Harris at Walla Walla

Milo T. Harris of Spokane, President of Washington State Medical Association, spoke before the Walla Walla Valley Medical Society on December 12, when the society held its annual election.

Robert A. Campbell of Walla Walla was elected president; Robert W. Jamison, Walla Walla, vice-president, and John B. Adams, Walla Walla, secretary.

Dr. Harris told society members of increasing demands on the State Association for greater services and said it was evident there would have to be an increase in dues if these demands were to be met.

Only a week later the Association's Executive Committee recommended for approval of the Board of Trustees that the annual dues be raised from $35 to $45. If the Board approves the recommendation, the matter will be presented to the House of Delegates at the September convention.

The President pointed out that the annual convention was being held this year in Spokane for the first time since 1954, and that this afforded a fine opportunity for Eastside members to participate in the scientific programs.

New Department Approved for UWSM

Board of Regents of the University of Washington School of Medicine have approved the establishment of a Department of Physical Medicine and Rehabilitation in the School of Medicine. The new department is headed by Justus Lehmann, who joined the faculty earlier last year.

A $34,700 gift from the Sister Elizabeth Kenny Foundation of Minneapolis will be used for equipment in the Rehabilitation Center which will be an important part of the department. The Center will be unique in the Pacific Northwest in offering a teaching program along with restorative services to the handicapped and disabled. Opening of the Center in the University Hospital is scheduled for this year.

The curriculum of the new department will provide training for medical students and a graduate program for physicians who wish to specialize in rehabilitation work. In addition, training courses will be offered for physical and occupational therapists, speech and hearing therapists, and medical and psychiatric social workers.

compounds tested

1

compound unexcelled

Progress has been made in antibiotic therapy through the use of absorption-enhancing agents, resulting in higher, more effective antibiotic blood levels.

For the past two years, in a continuing search for more effective agents for enhancing oral antibiotic blood levels, our Research Laboratories screened eighty-four adjuvants, including sorbitol, citric acid, sodium hexametaphosphate, and other organic acids and chelating agents as well as phosphate complex and other analogs. After months of intensive comparative testing, glucosamine proved to be the absorption-enhancing agent of choice. Here's why:

1 Crossover tests show that average blood levels achieved with glucosamine were markedly higher than those of other enhancing agents screened. In some cases this effect was more than double.

2 Of great importance to the practicing physician is the consistency of the blood level enhancement achieved with glucosamine. Extensive tests show that the enhancing effect with glucosamine occurs in a greater percentage of cases than with any other agent screened.

3 Glucosamine is a nontoxic physiologic metabolite occurring naturally and widely in human secretions, tissues and organs. It is nonirritating to the stomach, does not increase gastric secretion, is sodium free and releases only four calories of energy per gram. Also, there is evidence that glucosamine may favorably influence the bacterial flora of the intestinal tract.

For these reasons glucosamine provides you with an important new adjuvant for better enhancement of antibiotic blood levels. Tetracycline, potentiated physiologically with glucosamine, is now available to you as COSA-TETRACYN.

Capsules 250 mg. and 125 mg.

COSA-TETRACYN*

GLUCOSAMINE-POTENTIATED TETRACYCLINE

The most widely used broad-spectrum antibiotic now potentiated with glucosamine, the enhancing agent of choice

"Doctors can't help shingles?"

Physicians who have used PROTAMIDE extensively deplore such statements as unfortunate when they appear in the lay press. They have repeatedly observed in their practice quick relief of pain, even in severe cases, shortened duration of lesions, and greatly lowered incidence of postherpetic neuralgia when PROTAMIDE was started promptly. A folio of reprints is available. These papers report on zoster in the elderly—the severely painful cases—patients with extensive lesions. PROTAMIDE users know "shingles" *can* be helped.

Obituaries

Dr. George I. Birchfield, 75, former Seattle physician, died November 15 in Burbank, Calif. Dr. Birchfield had moved to Burbank about four years ago at the time he retired from active practice. He was graduated from the National University of Arts and Sciences Medical Department, St. Louis, in 1916.

Dr. Frank A. Plum, 71, Tacoma EENT specialist, died November 16 of a coronary occlusion. Dr. Plum received his medical degree in 1915 from the University of Pennsylvania School of Medicine. Following graduation, he served as house surgeon at Queens Hospital in Honolulu, and then went on to take his specialty training at the Mayo Clinic. Dr. Plum had practiced in Tacoma for the past 20 years.

Dr. Rush Banks, 85, pioneer Centralia physician, died November 27 of hemorrhage, shock and infection from ulcerating, infected carcinoma of the right hand and upper extremities due to x-ray burns suffered 30 to 40 yeas ago. Dr. Banks received his medical training at the University of Michigan Medical School from which he was graduated in 1901. He practiced at Uniontown for two years before locating in Centralia where he served the community for more than half a century before retiring three years ago because of ill health. He had been awarded a 50-year pin from Washington State Medical Association of which he was an honorary member.

Dr. John H. McArthur, 89, died November 29 in a Centralia hospital of bronchopneumonia due to cerebrovascular disease. Dr. McArthur located in Oakville 51 years ago and practiced there until his retirement 10 years ago. He received his medical degree in 1897 from Queen's University Faculty of Medicine, Kingston, Ontario.

Dr. David A. Ewing, 80, who had practiced in Seattle for more than 50 years, died November 30 of an acute coronary thrombosis. Dr. Ewing received a 50-year pin from Washington State Medical Association in 1954. He was an honorary member of the Asociation. Dr. Ewing was graduated from the University of California School of Medicine in 1904.

Dr. Victor E. Bellinger, 65, retired Seattle and Orcas Island physician, died November 1 of anoxia and cyanosis due to right heart failure. Dr. Bellinger received his medical training at Drake University College of Medicine, Des Moines, Iowa, from which he was graduated in 1913. Following service with the army in France during World War I, he practiced in New York. He located in Bellingham in 1929 and then practiced in Seattle from about 1935 until he moved to Orcas Island in 1952. Dr. Bellinger had been on the staff of Northern State Hospital at Sedro Woolley and Eastern State Hospital at Medical Lake in recent years.

Dr. Paul L. West, 84, retired Chelan and Douglas County health officer, died December 2 in a Wenatchee hospital of a cerebrovascular accident. Dr. West was graduated in 1902 from the University of Colorado School of Medicine. Before being appointed health officer for Chelan and Douglas Counties in 1924, Dr. West held that post in Okanogan County. He retired in 1955.

Dr. Herbert E. Tomlinson, 59, of Port Angeles, died at his office December 4 of a heart attack. Dr. Tomlinson attended the University of Vermont College of Medicine from which he was graduated in 1925. He took his internship at the Lying-In Hospital in New York and the Norwegian Deaconess Hospital in Brooklyn. He served with the U.S. Army from 1926 until the end of World War II. Following separation from the service, Dr. Tomlinson joined the faculty of the University of Washington School of Medicine where he taught until 1949 when he moved to Port Angeles to begin private practice.

COMMITTEES

(*The President is ex-officio member of all committees.*)

EXECUTIVE—Standing Committee:
(Three members selected by the *Board of Trustees* from among its members, to serve during the pleasure of the Board. ((President-Elect, Past-President and Secretary-Treasurer constitute Executive Committee, with President as an ex-officio member. BT action 11-4-45.)) *PURPOSE*: Shall review and pass on all bills incurred by the Association and must approve same before Secretary-Treasurer may pay them. Shall prepare and present a general fund budget, with approval of the Finance Committee. Shall supervise and direct the Executive Secretary and other employees. Shall exercise, (except when the Board of Trustees is in session), any and all powers of the Board of Trustees and the management of the affairs and business of this Association. 1940 HD.).

James H. Berge, 714 Stimson Building, Seattle, *Chairman* (Past-President)
Milo T. Harris, 252 Paulsen Med-Dent. Bldg., Spokane, (President)
Emmett L. Calhoun, Becker Bldg., Aberdeen (Pres-Elect)
Frederick A. Tucker, 7302 Woodlawn Ave., Seattle (Secy-Treas.)
(The Past-President is Chairman by precedent.)

AGING POPULATION, COMMITTEE ON—Special Committee:
(Appointed to one-year terms by *President. PURPOSE*: To study health problems of this age group; and to determine how these people can continue to work in business and industry and not become dependent on society for their livelihood. 1949 HD.)

Byron F. Francis, 900 Boylston Avenue, Seattle, *Chairman*

(Continued on page 231)

Published reports confirm—

BETTER PAIN RELIEF

than with a standard APC formula...*

Phenaphen®

In a recent controlled study,* Phenaphen was found more effective than a standard aspirin-phenacetin-caffeine formula for relief of moderate to severe pain... with total freedom from side effects and from any tendency to induce drowsiness.

*Murray, R. J.: N. Y. State Jl. Med. 53:1867, 1953.

Each PHENAPHEN capsule contains —

Acetylsalicylic Acid (2½ gr.)	162 mg.
Phenacetin (3 gr.)	194 mg.
Phenobarbital (¼ gr.)	16.2 mg.
Hyoscyamine Sulfate	0.031 mg.

Also available —

PHENAPHEN with CODEINE PHOSPHATE ¼ GR.

Boise, Idaho

SIXTY-SIXTH ANNUAL MEETING
July 6-9, 1958
Sun Valley

President, H. B. Woolley, M.D., Idaho Falls Secretary, W. B. Ross, M.D., Nampa Exec. Secy., Mr. A. L. Bird, 364 Sonna Bldg., Boise

Work of Two Idaho Physicians Praised At AMA Philadelphia Meeting

AMA Philadelphia meeting early in December provided an opportunity for two Idaho physicians to receive plaudits for their activities. Receiving recognition at the session were Quentin W. Mack of Boise, and Donald K. Worden of Lewiston.

Dr. Mack, who serves as Chairman of our Association's Industrial Medical Committee, and who has served as a member of AMA's Committee on Medical Rating of Physical Impairment for more than two years, was delegated to meet with AMA Board of Trustees to explain the work of the committee in preparing a 115 page "Guide For the Evaluation of Permanent Impairment of the Extremities and Back," and received the plaudits of the Board for the committee's outstanding work. The Guide is expected to be of particular help to physicians in determining benefits under the Social Security Act and workmen's compensation cases.

AMA House of Delegates praised the committee for its work in "turning in a superb job on this difficult subject."

To make the committee work even more impressive, AMA is planning to print and distribute 250,000 copies of the Guide.

One of the most controversial issues at the Philadelphia session was fluoridation, and Dr. Worden took an active part in resolving this subject. A House of Delegates Reference Committee had under consideration a 27 page report on the subject and arguments, pro and con, were rather heated.

After listening for a while, Dr. Worden was recognized by the Committee chairman. Speaking as a physician and as a Mayor of one of Idaho's larger cities, Dr. Worden presented a most convincing discussion in favor of the report. When he had concluded his statement, the Chairman of the Committee personally thanked Dr. Worden for his presentation and the Reference Committee recommended adoption of the report by the House of Delegates. Needless to say, the report was adopted.

Others who participated in the Philadelphia AMA session were President Hoyt B. Woolley, member of AMA Council on Medical Service; Delegate Raymond L. White; Alternate Delegate Alexander Barclay, and S. M. Poindexter, Chairman of the State Board of Medicine and a member of the Executive Committee of the National Board of Medical Examiners.

Many Changes Made in New Industrial Accident Fee Schedule

New Industrial Accident Fee Schedule will be ready soon. Quentin W. Mack, Boise, Chairman of the Association's Industrial Medical Committee, reports that final negotiations for the new Fee Schedule of the Idaho Industrial Physicians' Manual and Fee Schedule are complete and that the new schedule has been submitted to the State Industrial Accident Board for printing.

A large number of changes will be found in the Fee Schedule. Many items which previously carried a price tag have been eliminated and carry the word *agreement.*

The term *agreement* in the fee schedule means that the fee must be agreed upon between the physician and the surety prior to providing the service to the injured person. This is a sufficient reason for establishing your own list of fees.

This means that you should charge your Community Rate for services you render an injured person covered by Workmen's Compensation, either through private insurance carriers or by the State Insurance Fund.

Dr. Mack and members of his committee call your attention to the following paragraph in the Industrial Accident Board Manual concerning fees:

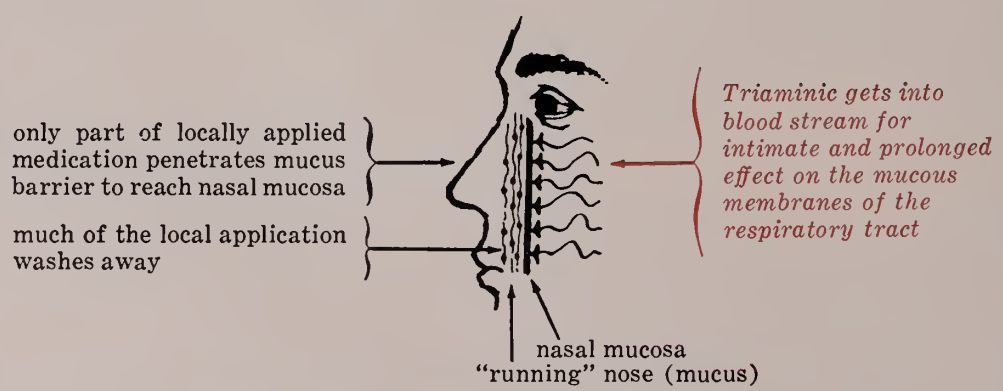
> The statutory criteria for fixing reasonable medical fees is as follows:
> The pecuniary liability of the employer (insurance carrier) for treatment and other services herein required shall be limited to such charges as prevail in the same community for similar treatment of injured persons of a like standard of living when such treatment is paid for by the injured person. In determining what fees and charges are reasonable, the Board (Industrial Accident) shall consider the increased security of payment afforded by this act.

Bear River Society Elects Officers

Bear River Society has elected the following new officers for 1958:

PRESIDENT—Emmett E. Herron, Grace.
PRESIDENT-ELECT—Leo R. Hawkes, Preston.
SECRETARY-TREASURER—Allen H. Tigert, Soda Springs.
DELEGATE—Dr. Herron.
ALTERNATE DELEGATE—Dr. Hawkes.

Bear River Medical Society is once again the first society in the state to attain 100 per cent paid up membership.



respiratory congestion orally

"This affords opportunity for shrinkage in areas that could not be approached by sprays, drops or actual topical applications."

—Morrison, L. F.: Arch. Otolaryng. 59:48-53 (Jan.) 1954.

Comparison of action of topical decongestants and an orally administered decongestant

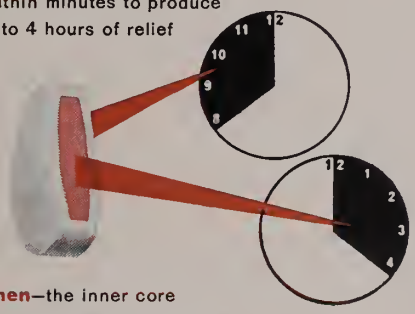
TOPICAL DECONGESTANT	TRIAMINIC ORAL DECONGESTANT
Duration of relief is brief	*Keeps nasal passages clear 6 to 8 hours*
Decongestion often followed by secondary congestion which may be equal to or even worse than the original condition	*Secondary congestion does not occur*
Local overtreatment may cause pathological changes in nasal mucosa	*No pathological changes in nasal mucosa*
Patients frequently experience "nose drop addiction"	*The "nose drop addiction" phenomenon does not occur*
Much of the medication is washed away by nasal mucus. Mucus often forms a barrier between the medication and the nasal mucosa	*Not affected by nasal mucus. Gets into the blood stream so that it has intimate and prolonged effect on nasal mucosa*

The Triaminic form and formulation, described in detail on the next page, have proved remarkably effective as an oral decongestant.

STOP respiratory congestion orally

relief in minutes... lasts for hours

In the common cold, nasal allergies, sinusitis, and postnasal drip, one timed-release Triaminic tablet brings welcome relief of symptoms *in minutes*. Running noses stop, clogged noses open—and *stay* open for 6 to 8 hours. The patient can breathe again.



With *topical* decongestants, "unfortunately, the period of decongestion is often followed by a phase of secondary reaction during which the congestion may be equal to, if not greater than, the original condition. . . ."* The patient then must reapply the medication and the vicious cycle is repeated, resulting in local overtreatment, pathological changes in nasal mucosa, and frequently "nose drop addiction."

Triaminic does not cause secondary congestion, eliminates local overtreatment and consequent nasal pathology.

*Morrison, L. F.: Arch. Otolaryng. 59:48-53 (Jan.) 1954.

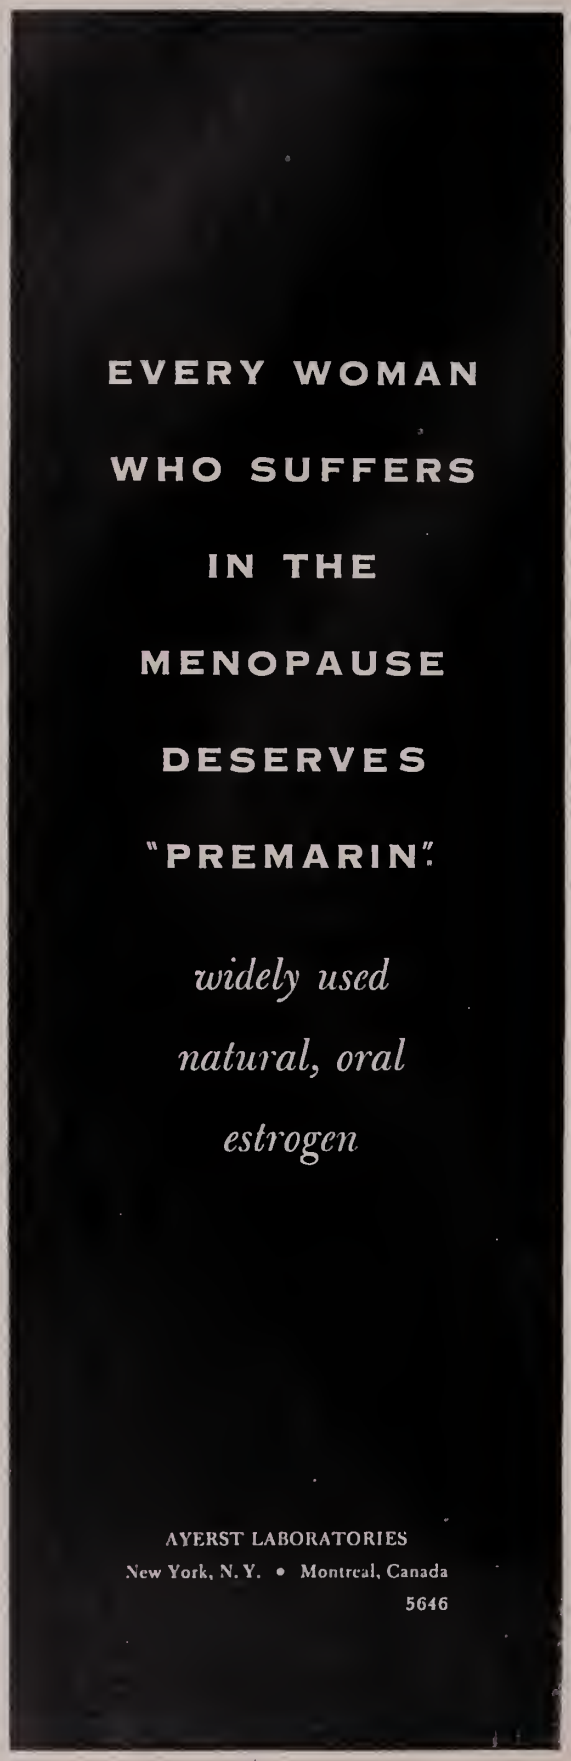
Each double-dose "timed-release" tablet keeps nasal passages clear for 6 to 8 hours—provides "around-the-clock" freedom from congestion on just three tablets a day

first—the outer layer dissolves within minutes to produce 3 to 4 hours of relief

then—the inner core disintegrates to give 3 to 4 more hours of relief

Each double-dose "timed-release" TRIAMINIC *Tablet contains:*

Phenylpropanolamine hydrochloride	50 mg.
Pyrilamine maleate	25 mg.
Pheniramine maleate	25 mg.



Dosage: **1** tablet in the morning, afternoon, and in the evening if needed.

Also available: Triaminic Syrup, for children and and those adults who prefer a liquid medication.

Triaminic® *"timed-release" tablets*

stop running noses...  *and open stuffed noses orally*

Boise Valley Chapter of American College of Surgeons Meets in Boise

Boise Valley Chapter of the American College of Surgeons met in Boise on December 14 with more than 85 physicians attending. Speakers at the session included: Frank Gerbode, San Francisco, Professor of Surgery, Stanford College of Medicine, and Vice-President of the American College of Surgeons; William R. Tregoning, William D. Forney, Leon W. Nowierski, and Robert S. McKean, all of Boise, and Samuel C. Taylor of Nampa.

Everett N. Jones, E. D. Parkinson, Alfred M. Popma, Kenneth Helferty, Boise, and Dr. Gerbode participated in a panel discussion.

New officers elected are: President, A. Curtis Jones, Boise, succeeding Robert S. Smith of Boise; Secretary-Treasurer, Leon W. Nowierski, Boise, succeeding Richard A. Forney, Boise; President-Elect, H. M. Chalupka, Boise; and Councilor, Kenneth Helferty, Boise.

State Board of Medicine

Regular semi-annual meeting of the State Board of Medicine was held in Boise beginning January 13, 1958. A total of 14 candidates applied for licensure at this meeting.

Members of the Board are: S. M. Poindexter, Boise, Chairman; W. B. Ross, Nampa, Vice-Chairman; Paul M. Ellis, Wallace; Clyde E. Culp, Moscow; Leland K. Krantz, Idaho Falls, and Fred T. Kolouch, Twin Falls.

No Temporary Licenses were issued during December.

Medical-Legal Joint Meeting

The Doctor Defendant, a new movie produced by the American Medical Association and the American Bar Association, was shown to Boise attorneys and physicians from the Southwestern Idaho Society on December 18. More than 150 attorneys and physicians viewed the film. The joint session was sponsored by the Third District Bar Association of which Mr. Robert Green, Boise, is President.

Location

Clark T. Parker, Pocatello, has been released from active military duty and has accepted the position of University Physician at Idaho State College in Pocatello. Dr. Parker spent most of his service in Germany.

Obituary

Dr. Charles R. Lowe, 78, died December 16 in a Boise hospital. Born in Willard, Utah, September 30, 1879, Dr. Lowe was graduated from the University of Michigan School of Medicine in 1911 and practiced in Springfield, Illinois, from 1914 to 1916 when he moved to Boise to establish his practice. Dr. Lowe served as Superintendent of the Idaho State Hospital South, Blackfoot and also as superintendent of the Nampa State School. He was a veteran of World War I.

NOW— EFFECTIVE STEROID HORMONE THERAPY OF RHEUMATIC AFFECTIONS WITH GREATER SAFETY AND ECONOMY

PABALATE-HC

Robins

Pabalate with Hydrocortisone

Clinical evidence indicates that, in Pabalate-HC, the synergistic antirheumatoid effects of hydrocortisone, salicylate, para-aminobenzoate, and ascorbic acid achieve satisfactory remission of symptoms in *up to 85% of cases studied*

—with a much higher degree of safety

—even when therapy is maintained for long periods

—at significant economy for the patient

Each tablet of Pabalate-HC contains 2.5 mg. of hydrocortisone — 50% more potent than cortisone, yet not more toxic.

FORMULA

In each tablet:

Hydrocortisone (alcohol)	2.5 mg.
Potassium salicylate	0.3 Gm.
Potassium para-aminobenzoate	0.3 Gm.
Ascorbic acid	50.0 mg.

DOSAGE: Two tablets four times daily. Additional information on request.

Smith, Kline & French Foundation Makes First Public Report of Grants

Smith, Kline & French Foundation, independent philanthropic arm of Smith, Kline & French Laboratories, recently gave a detailed public accounting of its disbursement of $1,457,876 in the first four years (1953 through 1956) of its history. The Foundation was established by the pharmaceutical firm in December 1952 after years of informal company participation in philanthropy.

Of the five areas supported with Foundation funds, basic research in medicine and related sciences received the largest portion—$673,910 for projects unrelated to the firm's commercial research interests. Following in order were educational grants, $320,711; public charities and community improvement, $178,650; mental health, $157,500, and building and equipment funds, $127,105.

In the Northwest, the University of Oregon Medical School received two grants totaling $8000, and the University of Washington School of Medicine was awarded six grants totaling $17,300.

The two grants received by the University of Oregon were a $3000 grant awarded in 1953 for research in dermatology under the direction of Aaron B. Lerner, associate professor of dermatology, and an unrestricted grant of $5000 made in 1956 to the department of obstetrics and gynecology under the department head, Ralph C. Benson.

Departments and recipients of grants at the University of Washington were as follows: department of surgery in 1956 received an unrestricted grant of $5000 for research and teaching activities in anesthesiology under the direction of Lucien E. Morris, professor of anesthesiology; an unrestricted grant of $5000 was made to the department of medicine in 1956 to assist Paul Van Arsdel, Jr., to develop the then newly-created division of allergy; the College of Pharmacy in 1956 was given an $800 student fellowship in pharmacy for summer research under the direction of Louis Fischer, Ph.D., professor of pharmaceutical chemistry; and the School of Medicine received grants of $3000 in 1954 and $3500 in 1955 for research fellowships.

American College of Surgeons To Hold Sectional Meeting in March

According to Roland D. Pinkham of Seattle, Governor of the American College of Surgeons, the sectional meeting of the College will be held in Salt Lake City, Utah, March 17 through March 19. Dr. Pinkham reports that the sessions will be of particular value to those interested in traumatic surgery.

Topics covered will include: pediatric surgery, posttraumatic paraplegia, trauma, cancer, ACTH and cortisone in surgery, common duct stones, cardiac resuscitation, bleeding peptic ulcer, and hand surgery. A full day will be devoted to opthalmic surgery. Medical motion pictures will be shown also.

We believe that alcoholism is predominantly a physiologic demand for alcohol

HEADACHE: DIAGNOSIS AND TREATMENT. Ed. 2. By Robert E. Ryan, M.D., Department of Otolaryngology, St. Louis University School of Medicine. 421 pp. Price $6.75. The C. V. Mosby Co., St. Louis. 1957.

Headache is probably the most common affliction of man. It is a symptom of numerous diseases and pathologic conditions. Most physicians see many of these daily, whether they practice ENT, eye, neurology, internal medicine or general practice. Others are so rare as to never be seen by most doctors. This book gives a concise, adequate review of all the common forms of headache and a brief coverage of most of the rare forms. It is not a comprehensive monograph on the subject, but is intended as a guide to diagnosis and modern treatment. Naturally, more space is devoted to common causes than to rare forms of headache.

While the material in some chapters seems repetitious, the general outline of the book is good and

gives a concise review of the headache problem on an etiologic basis.

To anyone familiar with the problems of diagnosis and treatment of headaches, this book is of less value than it would be to medical students and those who have never read a comprehensive review of headache as a presenting symptom.

Noel B. Rawls, M.D.

PLASTER OF PARIS TECHNIQUE. By Marian English, S.R.N., R.F.N., Late Sister-in-Charge, Plaster Department, Ancoats Hospital, Manchester, England. Foreword by D. L. L. Griffiths, M.B.E., F.R.C.S., Surgeon-in-Charge, Manchester University Department of Orthopedic Surgery, Manchester Royal Infirmary; Senior Visiting Orthopaedic Surgeon, Robert Jones and Agnes Hunt Orthopaedic Hospital, Oswestry. 126 pp. Illustrated. Price $4.00. E. & S. Livingstone Ltd., Edinburgh and London. 1957. Distributed by Williams and Wilkins Co., Baltimore.

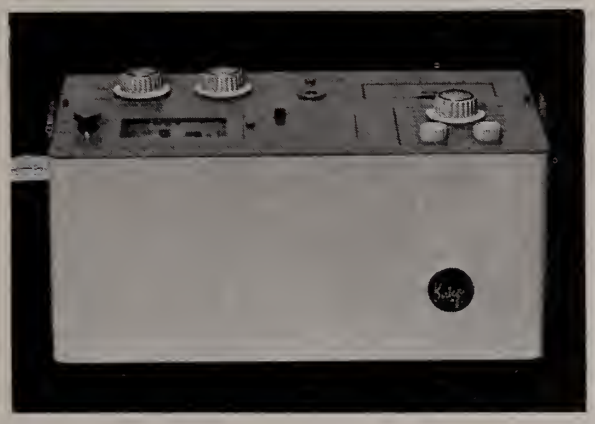
This book was written primarily for local use by an English nurse in a large teaching hospital. The first few chapters deal with the process of making plaster bandages, the equipment used in applying and removing casts, and cast room facilities. The next few chapters deal with general principles of applying plaster casts, the difficulties encountered in improper applications and methods of coping with these complications. The remainder of the book is dedicated to specific types of casts for specific conditions. The body is taken section by section and technique is outlined for application of casts for various injuries occurring in different sections of the body. Treatment of fractures or orthopaedic conditions is not dealt with, but as the name implies, this is a text book of plaster technique.

It would be of interest and value to medical students, interns and particularly nurses, but physicians should be well acquainted with technique outlined in this text.

E. E. Sprecher, M.D.

ALLERGY IN PEDIATRIC PRACTICE. By William B. Sherman, M.D., Associate Clinical Professor of Medicine, Columbia University College of Physicians and Surgeons, New York; and Walter R. Kessler, M.D., Ph.D., Instructor in Pediatrics, Columbia University College of Physicians and Surgeons, New York. 296 pp. Illustrated. Price $9.25. C. V. Mosby Company, St. Louis. 1957.

This very readable volume is short enough to be of great value to the group for which it is intended—that is, the general practitioner and practicing pediatrician. The authors have focused their attention on diseases in which the allergic methods of diagnosis and treatment have proved of value. It is quite comprehensive. Much source material has been eliminated or condensed, adding inestimably to its readability. Illnesses in which allergic methods of diagnosis and treatment are not applicable are not considered as being proven of allergic origin. The authors attach a good deal of importance to the passive transfer method of testing.



It is a distinct pleasure to find a textbook which is lucid, clear and to the point. This can enthusiastically be recommended to those who come in contact with allergy in a general or pediatric practice.

R. M. Overstreet, M.D.

RECOVERY FROM SCHIZOPHRENIA: THE ROLAND METHOD. By John Eisele Davis, Sc.D., President, Association for Physical and Mental Rehabilitation; Formerly, Chief, Corrective Therapy, Veterans Administration. 161 pp. Price $4.75. Charles C Thomas, Springfield, Ill. 1957.

After reading this book, one wonders why it was published. It is a hodgepodge cookbook said to have been written for physicians, psychologists, social service workers, "activity therapists," vocational counsellors, nurses and "other paramedical personnel engaged in the field of mental treatment and rehabilitation." Described in a circumstantial manner, however, are the experiences and opinions of a re-

SQUIBB ANNOUNCES a new, improved agent for better management of psychotic patients

schizophrenia • manic states • psychoses associated with organic brain disease

VESPRIN

Squibb Triflupromazine 10-(3-dimethylaminopropyl)-2-(trifluoromethyl) phenothiazine hydrochloride

In extensive clinical experience—singularly free from toxicity

- Jaundice or liver damage—not observed
- Skin eruptions—rare
- Photosensitivity—rare
- Hyperthermia—rare
- Convulsions—not observed

Dosage: Usual initial dose, 25 mg. t. i. d., to be adjusted according to patient response. See literature.

Tablets of 10, 25 and 50 mg.

"VESPRIN" IS A SQUIBB TRADEMARK

Chemically improved

Modification of the phenothiazine structure potentiates beneficial properties . . . reduces unwanted effects

Pharmacologically improved

Enhanced potency with far less sedative effect

Clinically improved

Does not oversedate the patient into sleepiness, apathy, lethargy

Drug induced agitation minimal

Active and rapid in controlling manic states, excitement and panic . . .in modifying the disturbing effects of delusions and hallucinations . . . in moderating hostile behavior . . . in facilitating insight

Intractable behavior patterns brought under control . . . patients made accessible to psychotherapy . . . nursing care reduced . . . social rehabilitation hastened

Effective dosage levels may be reached without development of side effects

SQUIBB *Squibb Quality—the Priceless Ingredient*

(Continued from page 249)

creational worker functioning as a psychiatric attendant on wards housing neglected or chronic schizophrenics. Organization is poor and definition of terms is conspiculously lacking. Cliches, platitudes and pseudo-scientific jargon are liberally used. About the only good purpose to be served by the book is to point out what can happen in psychiatric hospitals when medical staffs are insufficient in number to assume responsibilities for patient treatment and care. Such medical responsibilities are often allowed to be preempted by other employees as administrators try to substitute programs for physicians. The book well illustrates the folly of this course. I cannot recommend Recovery from Schizophrenia for mental hospital libraries.

Charles H. Jones, M.D.

SURGERY IN WORLD WAR II: ORTHOPEDIC SURGERY IN THE MEDITERRANEAN THEATER OF OPERATIONS. By Oscar P. Hampton, Jr., M.D., Assistant Professor of Clinical Orthopedic Surgery, Washington University School of Medicine, St. Louis. Edited by Colonel John Boyd Coates, Jr., MC, Editor in Chief; Mather Cleveland, M.D., Editor for Orthopedic Surgery; and Elizabeth M. McFetridge, M.A., Associate Editor. 368 pp. Illustrated. Price $4.00. U.S. Government Printing Office, Washington 25, D.C. 1957.

I have enjoyed perusing this text, edited by Col. John Boyd Coates, Jr., Medical Corps, editor and chief, with Mather Cleveland, orthopedic surgeon of New York as the editor of Orthopedic Surgery.

It was my privilege to serve under Colonel Cleveland in the European Theatre of operations, World War II, where Col. Cleveland was the Chief Orthopedic Consultant. Experience gained in previous wars, and in North Africa prior to the invasion of the continent, helped formulate the policies and medical techniques used in the European theatre in treatment of orthopedic patients with war wounds.

This text is extremely useful and instructive to any surgeon who may be called upon to treat compound fractures or wounds from high velocity missiles or bomb fragments. It also applies to the treatment of industrial or private practice compound fractures in general. This text will also serve as a very instructive and practical text for medical students, for surgical and orthopedic residents, and for those men likely to be called into military service.

In the first section there is a reasonable but comparatively short section on administrative considerations which prevailed in the Mediterranean campaigns. This is followed by a discussion and historical account of the splinting procedures used and developed, with the relative merits of these procedures. An excellent treatise on management of compound battle fractures, in their various stages from first aid on, is presented. This includes the various methods used, that had been tried by different units, with comparative results.

It was in this theatre that "stage management" of compound fractures and injuries was developed to such a degree that in both the European theatres and later in the Korean War, the value of this method of handling war wounds was established. The evolution of the use of various emergency splints is reviewed. The treatment of compound battle fractures and injuries of the extremities includes extensive wound trimming, with irrigation first and the use of local sulfanilamide or local penicillin plus wide open drainage and plaster immobilization. This made possible early transfer and transportation to rear echelons. At rear echelons, preferrably at a time prior to 10 days after wounding, the revision and closure, often with grafting or plastic procedures on the wound, preceded definite treatment of the fractures.

The detail of the treatment of the wounds and the discussion of the various features of the techniques of wound trimming or excision is very clearly formulated from adequate experience. The technique of maintaining reduction and alignment of compound

fractures is given excellent consideration. The question of internal fixation has been entered into. Compound fractures are then considered for each region anatomically. Adequate illustrations appear throughout the text. Statistical tables from various units of the Mediterranean theatre add to the educational value of this text.

There is a very authoritative dissertation on compound wounds of joints, with a history of the development of final technique. Amputations, especially initially, are given some consideration. An interesting discussion of non-combatant orthopedic lesions further amplifies the writing on orthopedic problems in the Army. The text is closed with a number of circular letters considered pertinent in the development of the treatment of the wounded, at certan dates in the campaigns.

I consider this treatise a valuable, modern text on war surgery and with a similar text compiled on orthopedic surgery of the European theatre, it represents a tremendous amount of surgical and orthopedic experience in warfare.

D. G. Leavitt, M.D.

CIBA FOUNDATION COLLOQUIA ON ENDOCRINOLOGY. Volume X: Regulation and Mode of Action of Thyroid Hormones. Edited by G. E. W. Wolstenholme, O.B.E., M.A., M.B., B.Ch.; and Elaine C. P. Millar, A.H.-W.C., A.R.I.C. 311 pp. Illustrated. Price $8.50. Little, Brown and Company, Boston. 1957.

Some twenty years ago, it was the feeling of many clinicians and physiologists that most of the problems of thyroid gland function and action were solved. That such is not the case, in fact, that the more we know the less we know, is amply illustrated by this volume. The availability of I^{131} for tracer studies, newer chromatographic techniques and procedures whereby sub-cellular tissue fractions may be studied intensively have all contributed to a reawakening of investigational interest and hence to many new discoveries in the thyroid field.

This book is a record of a colloquium held in London in June of 1956 in which 32 of the foremost authorities on thyroid hormone action and regulation from Europe, New Zealand and the United States participated. Detailed technical papers dealing with such subjects as hypothalamus-pituitary-thyroid relationships, the thyroid iodine "pump," enzymic aspects of thyronine metabolism, metabolic products of triiodothyromine and cellular actions of thyroxine are present. The detailed records of discussion following each paper are included and invariably provide the reader with much valuable information and opinion. This is an excellent reference and source book for the investigator. It is not clinically oriented and hence of little interest to the pure clinician.

John R. Hogness, M.D.

A TEXT-BOOK OF X-RAY DIAGNOSIS in 4 Volumes, Vol. I, ed. 3. By British Authors. Edited by S. Cochrane Shanks, M.D., F.R.C.P., F.F.R., London; and Peter Kerley, C.V.O., C.B.E., M.D., F.R.C.P., F.F.R., D.M.R.E., London. 521 pp. 533 illustrations. Price $18.00. W. B. Saunders Company, Philadelphia and London. 1957.

Volume I of the third edition of A Text-Book on X-Ray Diagnosis contains 521 pages on diseases of the head and neck as seen at radiologic examination. This splendid English book was first published in 1938 and revised again in 1950. An increase of 100 pages in the third over the second edition is due, in part, to additions in the subject matter and, in part, to minor changes in format, making the book easier to read.

The book is divided into five parts: the central nervous system, the teeth and jaws, the eye, the accessory nasal sinuses, and the ear and temporal bone. The chapter on the central nervous system is excellent and has more additions and revisions than the other four chapters. There are good descriptions on the techniques of encephalography, ventriculog-

NEOSORB®

TABLET OR LIQUID

EACH TABLET CONTAINS—

Aluminum Hydroxide
Gel (Dried) .....4 grs. (0.26 Gram)
Magnesium Trisilicate .....7 grs. (0.45 Gram)
Methylcellulose (mucin-like
colloid) .....1 gr. (0.065 Gram)

DOSAGE: 2 tablets every 2 to 4 hours. Tablets to be chewed and swallowed without the aid of fluids. 1 tablespoonful of liquid NEOSORB equivalent to 2 NEOSORB tablets. Supplied in sizes 100, 500 and 1000 tablets. Liquid in quarts and pints.

LABORATORIES, INC. portland 1, oregon

LIVERMORE SANITARIUM

This facility provides an informal atmosphere seldom found in hospitals elsewhere. A sound and scientific approach to emotional problems is provided with careful deliberation, with the patients' best interests given every consideration. Our approach is eclectic with emphasis along the lines of dynamic and psychobiologic psychiatry. Every recent therapy is available.

Individual services are amply provided for; in individual cottages if desired, so that the patient's every need is considered.

All diagnostic and ancillary consultative services are available.

Information upon request.

EPILEPSY

Samples of the electroencephalogram of patient taken before and during treatment with DIAMOX[1]

DIAMOX*

ACETAZOLAMIDE LEDERLE

Administered by mouth to 126 patients with various forms of epilepsy, many of whom were refractory to standard therapy, DIAMOX gave practically complete control of seizures in 34 cases, 90-99% reduction of seizures in an additional 12 cases, 50-90% in 22 cases, less than 50% in 58 cases. Diet was not restricted. *In at least half of the patients benefited,* DIAMOX *was used alone.*

In no cases was the condition made worse. No serious abnormalities of blood, urine, or bone were observed during treatment, *which was maintained over periods from three months to three years.*

Measures having a beneficial influence on epileptic seizures often involve certain drawbacks. In contrast, DIAMOX is simple to administer, has a wide margin of safety, produces a smaller systemic acidosis, has *an effect that is surprisingly well sustained.*

A highly versatile drug, DIAMOX has also proved singularly useful in other conditions, including cardiac edema, acute glaucoma, obesity, premenstrual tension, toxemias and edema of pregnancy.

Supplied: Scored tablets of 250 mg., syrup containing 250 mg. per 5 cc. teaspoonful.

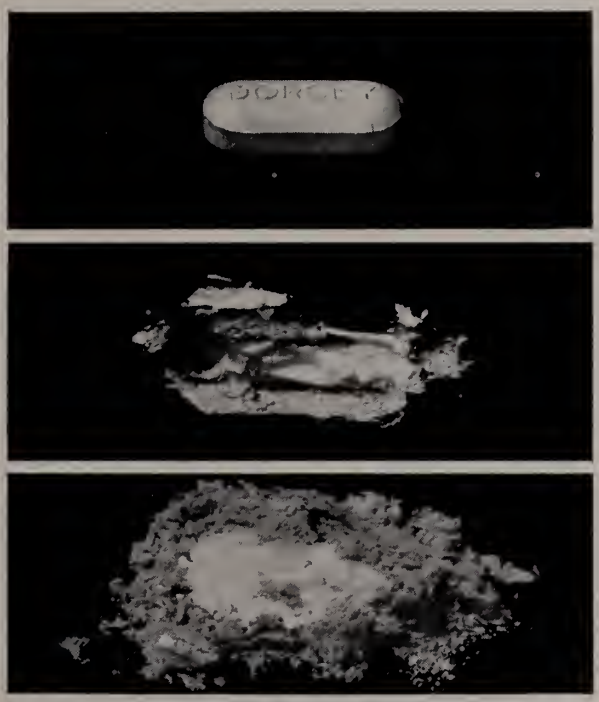
Consistent Gains in Functional Capacity Can Be Achieved with Conservative Therapy

The unemployable arthritic once again may undertake full employment and normal recreation. Patients once confined to the home or wheel chair often find it possible to engage in light work. And even bedridden patients can walk with comfort again. These are the benefits of conservative therapy as demonstrated in long-term studies.[1,2,3] In fact, in these four-year comparative studies of salicylate and cortisone, the corticoid showed no superiority over conservative therapy.

Superior Conservative Therapy Provided by Buffered Pabirin

Buffered Pabirin epitomizes modern, conservative therapy without the serious complications of corticoid therapy. Adrenal atrophy, peptic ulcers, moon-face, hypertension or psychotic reactions, a constant risk whenever corticoids are used,[4-7] will not occur with Buffered Pabirin. Month after month, Buffered Pabirin can be administered with a minimum of problems to patient and physician, and without the side effects common to the use of salicylates alone.



Buffered Pabirin combines new form and formulation for faster pain relief, improved gastric tolerance

Each tablet of Buffered Pabirin consists of an outer layer containing a buffer (aluminum hydroxide), para-aminobenzoic acid and ascorbic acid; an inner core of aspirin. The outer layer quickly releases aluminum hydroxide which affords superior buffering action and protects against gastric irritation. The core of Buffered Pabirin then disintegrates rapidly, permitting fast absorption of acetylsalicylic acid. PABA potentiates the acetylsalicylic acid and creates high salicylate blood levels. Ascorbic acid counteracts vitamin C depletion.

The new form and formulation of Buffered Pabirin provides high and sustained salicylate blood levels. It may be administered over long periods of time without the nausea, dyspepsia or other gastrointestinal symptoms so frequently experienced with salicylates alone.

in osteoarthritis, gouty arthritis, rheumatoid arthritis, bursitis, fibrositis, or tendinitis

Photographs show 2-stage Tandem Release disintegration

Buffered Pabirin® *Tablets*

Each tablet contains:

Acetylsalicylic acid (5 gr.).....300 mg.
Para-aminobenzoic acid (5 gr.).....300 mg.
Ascorbic acid..... 50 mg.
Dried aluminum hydroxide gel.....100 mg.

All Buffered Pabirin is sodium and potassium free

Dosage: Two or three tablets 3—4 times daily.

(Continued from page 253)

raphy, angiography and myelography. Only minor changes are detected in the last four chapters. One of these concerns the discussion on internal resorption of the teeth.

The paper is better in quality and as a result the illustrations, which are in the positive, except those dealing with the teeth, show up better. As in the previous edition the bibliography and the index are adequate. The book is recommended reference to those interested in central nervous system radiology and other conditions of the head and neck.

F. E. Templeton, M.D.

GYNECOLOGIC SURGERY AND UROLOGY. By Thomas L. Ball, M.D., Assistant Professor of Clinical Obstetrics and Gynecology, Cornell University Medical College, New York. Foreword by R. Gordon Douglas, M.D., Professor of Obstetrics and Gynecology, Cornell University Medical College, New York. Illustrated by Daisy Stilwell. 547 pp. 161 plates. Price $20.00. The C. V. Mosby Company, St. Louis. 1957.

This is an attractive, well bound volume of 547 pages. Paper and printing are excellent. Illustrations are voluminous and well done. One cannot omit comment on the table of contents which is more detailed than customary and a desirable adjunct to a text of this type.

The material is divided into 12 sections, beginning with Minor Surgery and Office Procedures. The text gradually evolves into urologic consideration common to women and in Section 7, the largest, full consideration is given to various forms of therapy applicable to malignant vulval and pelvic disease. Here the various procedures involved in the different forms of ultraradical pelvic exenteration operations are well described.

This book clearly re-emphasizes the early and realistic point of view of Dr. Howard A. Kelly that gynecology and female urology are intimately and inseparably related, both in the field of diagnosis and therapy. Other texts such as those by TeLinde, by Wharton and by Everett have repeatedly stressed this generally overlooked concept.

The author stresses in Chapter 1 the importance of uterine dilatation and curettage, and enumerates 32 "surgical principles" governing this procedure. Unfortunately he fails to caution against the undesirability or danger of cervical manipulation and stretching in the presence of cancer or suspected cancer. Also, were he more familiar with the correct use of the Goodell dilator, he would probably refrain from making such sweeping comments concerning the dangers of its use. I would also take serious exception to the method he describes (pp. 25-26) of wiping out the uterine cavity with gauze after diagnostic curettage in order to obtain tissue for biopsy. It is, in my opinion, an indifferent and careless manner of treating tissue that is being obtained for purpose of histologic study. In fact, more space could be devoted advantageously to describing in more detail the method of obtaining and handling tissue obtained for biopsy.

The recommended use of exploratory colpotomy when used as a treatment for ectopic pregnancy, ovarian hemorrhage and section of the uterosacral ligaments for dysmenorrhea appear to me as unrealistically and dangerously over-reaching the permissible limits of this otherwise valuable procedure. In my experience, well defined and identifiable uterosacral ligaments are by no means always recognizible even on careful inspection at pelvic laparotomy. The surgical management of occluded fallopian tubes is well presented.

Backache as related to gynecology is well treated in Chapter 2, and congenital anomalies and their management are adequately described in Chapter 3. Infectious, trophic and dermatologic conditions are described in Chapters 5 to 7. Chapters 8 and 9 discuss the operation for relaxation and prolapse.

MRS. LOUISE L. HARRIS, R.N., *Superintendent*

I have little enthusiasm for the excessive plication of urethra and bladder, recommended by the author, for early cystocele and urethrocele. His failure to displace the bladder superiorly and to use other available paravaginal, paravesical and retropubic tissue to effectively replace bladder and urethra represent, I believe, real shortcomings.

Chapters 10, 11 and 12 concern urinary incontinence, fistulae, bladder surgery and uretero-intestinal anastomoses. An excellent discussion is given on urinary incontinence to which the author has directed much special personal study. A good description is given of bladder and urethral restitution for incontinence utilizing the vaginal and the anterior abdominal (Space of Retzius) approaches—i.e., Marshall-Marchetti operation. The surgical repair of urinary tract fistulae and the underlying surgical-physiologic principles involved are excellently described and illustrated. I would suggest, however, that in his next edition, the author devote more text and illustration to a description of the Schuchardt incision. It would be helpful also, I believe, to emphasize that the Latzko operation is designed primarily for fistulae at the apex of the vaginal vault where the uterus is absent, and that vaginal vault obliteration is the result and not the purpose of the operation. Uretero-intestinal anastomotic procedures as bladder substitutes are well described as are the physiologic-anatomical problems posed by them. No credit is given to the important contributions of Bricker to the use of ileal loop as a substitute bladder.

Chapters 13 to 15 concern proctology, minor ano-rectal procedures and the operation for posterior exenteration where cancer involves both bowel and generative tract. In the latter the author assumes that the reader is familiar with the radical abdomino-perineal procedure for cancer of the rectum. Likewise, the description of the perineal phase of the radical operation leaves much to be desired for the tyro who will have to consult some other surgical text, particularly when it comes to performing an accurate dissection of the ischio-rectal fossae and resection of the levator ani muscles under direct vision. Of course, it may be argued that this type of surgery is for the thoroughly initiated.

Various operations for benign disease of vagina, uterus and adnexa are well described. A discussion of malignant neoplasms is begun in Chapter 20, and the subsequent seven chapters cover this field—i.e.: theories, and chemical, radiation and surgical therapy of gynecologic cancer including the exenteration procedures and the varying methods used for management of permanently sectioned ureters.

I confess my lack of conviction for the need of the wide removal of skin over the inguino-femoral regions as advocated by the author in the operation for cancer of the vulva. In my limited experience the skin on the anterior aspect of the thigh is not where cancer recurs.

It is also interesting to note that, while the author gives considerable space to a discussion of the manner and sites of predilection for the spread of cervical cancer, he fails to mention the vagina as one of the common sites of recurrence in inadequately treated patients.

The remainder of the text, about 100 pages, is given over to injuries of gynecologic and obstetrical significance, and postoperative and operative complications including cardiac arrest. A description of abdominal incisions, hernias and intestinal surgery in relation to gynecology are interestingly described and followed by a number of other minutiae, not the least of which are retroperitoneal pelvic tumors and ectopic pregnancy.

Surgeons interested in gynecologic surgery and urology will find this a desirable addition to their libraries.

THE RETICULAR FORMATION OF BRAIN STEM: ANATOMICAL ASPECTS AND FUNCTIONAL CORRELATIONS. By Alf Brodal, Anatomical Institute, University of Oslo, Norway. 87 pp. Illustrated. Price $3.00. Published by the William Ramsay Henderson Trust by Oliver and Boyd, Edinburgh and London; and Charles C Thomas, Springfield, Ill. 1957.

The reticular formation is barely known by its name to most of us. Even neurologists and neurosurgeons are relatively vague about its anatomy and physiology. The present volume, written by an anatomist, outlines its anatomic delineations in the brain stem and tries to correlate them with neurophysiologic findings of this area which have proven most resistive to the exploring neurophysiologist. Only the last 10 years have seen the major advances, thanks mainly to refined recording and stimulation techniques. The essence of this publication was presented in the spring of 1956 in Edinburgh as two lectures by Professor Brodal, head of the department of anatomy at the University of Oslo. The data presented demonstrate that the reticular formation of the brain stem is an extremely complex part of the central nervous system. Being an anatomist, the author was able to prove that the reticular formation is not a diffusely organized structure but is subdivided into several regions with different cell structure, fiber connections and intrinsic organization. To correlate these structures with certain definite functions has not always been possible. The function of the reticular formation, far from being fully understood, covers antagonists like facilitation and inhibition (of vital importance in the study of tremor, extrapyramidal movements, diseases like Parkinsonism), inspiration and expiration, blood pressure regulation, control of cortical activity, consciousness and sleep.

This volume, a survey of present day knowledge, is truly intended for use by specialists in this particular field of neuroanatomy and neurophysiology. For the average medical reader, including clinical

neurologists and neurosurgeons, this volume is—like its topic—far too complex for easy reading or perusal; it represents a compilation of the important papers in this field and an admirable effort to tie them together. To those of us who are rightly proud of the University of Washington School of Medicine, it should be pointed out that one of its faculty, Arthur Ward with his 1948 paper on the cingular gyurs, was one of the important contributors in the study of function of the reticular formation.

FUN COMES FIRST FOR BLIND SLOW LEARNERS. By Mildred Blake Huffman, B.E., M.A., Primary Teacher, California School for the Blind, Berkeley, Calif.; with a Foreword by Samuel A. Kirk, Ph.D., Director, Institute for Research on Exceptional Children, University of Illinois, Urbana, Ill. 157 pp. Illustrated. Price $5.00. Charles C Thomas, Springfield, Ill. 1957.

This small volume is neither a textbook nor one to be read as light amusement. It relates the author's experience and approach in teaching children who are not only blind but mentally retarded and, due to this, maladjusted to their handicap and surroundings.

Major portion of the book is taken up by one chapter entitled "Growth through Interest and Experience" in which the author tells in some detail how interest is stimulated in the various educational processes, mostly through games and carefully planned incidents. The most important point brought out in the book is that these children, in spite of their many handicaps, are more like normal children than unlike them.

This book is well written, easily read and should be of interest to anyone who has contact with blind or retarded children—thus parents, teachers and doctors.

Robert C. Laughlin, M.D.

PRACTICE OPPORTUNITIES

GENERAL PRACTICE FOR SALE

Old, well established (one of city's largest) general practice for sale. Centrally located in near eastside Portland, Oregon. Practice offered for sale due to recent death of Dr. Suckow. Contact Mrs. George Suckow, 4232 N. E. Royal Court, Portland, BElmont 2-1886 or Mr. Arthur Baines, Weatherly Bldg., BElmont 5-3183, Portland, Ore.

EXCELLENT GP OPPORTUNITY

Home-office combination for sale at Priest River, Idaho. Very reasonably priced. Full office equipment, including 50 ma Westinghouse X-ray. New hospital 7 miles away at Newport, Wash. Physician in service; town very anxious for replacement. Contact Mr. Dick Sonntag, Priest River or Capt. H. G. Lawson, USAH, Dugway, Utah.

OPPORTUNITY FOR GENERAL PRACTITIONER

Only physician in large rural area, Northwestern Washington. Drawing area of 15,000. Very commodious office space, adequate equipment, comfortable furniture. Reasonable terms. Write Faith Funk, R.N., Everson, Washington.

GP OFFICE AND EQUIPMENT FOR LEASE

Completely furnished and equipped medical office for lease. Ground floor. Adequate parking. Busy suburban area in Seattle. Available immediately. Write Box 37-A, Northwest Medicine, 1309-7th Ave., Seattle, Wash.

OPPORTUNITY FOR GENERAL PRACTITIONER

GP group practice with four other GPs; 30 miles from Seattle. Snoqualmie Valley Clinic, Snoqualmie, Wash. Phone 88-3352.

SPECIALISTS NEEDED

An ophthalmologist and an otolaryngologist are needed in this town and district immediately. Area is growing. Due to retirement, furniture and equipment for sale. Contact Bernard Barkwill, M.D., Box 147, Coos Bay, Oregon.

GP OR PEDIATRICIAN ASSOCIATION

Well equipped 12-man clinic in Northwest Washington city offers association to general practitioner or pediatrician—eventual partnership depending upon adaptability. Washington license required. Pleasant working and living conditions. Excellent opportunity for growth. Replies held strictly confidential. Write Box 43-A, Northwest Medicine, 1309-7th Ave., Seattle, Wash.

MEDICAL OFFICE SERVICES

SPECIALIZING IN MEDICAL ACCOUNTS

Excellent experience in medical office methods and accounting. Service includes full bookkeeping, billing, taxes and collection—tailored to fit your needs. Medical references available. Limited to King County. Call Mr. Ellis, WAbash 3751, Seattle, Wash.

OFFICE SPACE

NEW CLINIC SPACE FOR LEASE

Clinic being built in new area with expanding population. Will tailor to suit specifications. Physicians and specialists needed. Hospital to be built nearby soon. For details call MYrtle 2342, or write Mrs. B. J. Sibon, 9619-196th S. W., Edmonds, Wash.

MEDICAL OFFICE FOR LEASE

New medical office with 800 sq. ft. located at Kenmore near Seattle. Adjoins dental office. Available now. Call GLadstone 3240 or FIlmore 1867, Seattle, Wash.

MEDICAL OFFICE FOR LEASE

Over 750 sq. ft. office space in completely new building, just across from new Supermarket in West Seattle. Very attractive rent. Contact Mr. Maier, 5048 California Ave., HOlly 1480, Seattle, Wash.

NEW MEDICAL OFFICE FOR LEASE

Office space of approximately 550 sq. ft. on ground floor. Will tailor to suit specifications. Reception room to be shared with dentist. Excellent parking lot. Thriving community. Contact Mr. J. E. Jones, MYrtle 2-2112, Route 1, Box 25, Silverdale, Wash.

BUY OR LEASE MEDICAL SPACE

Opportunity to buy or lease in Medical Dental Center, to be built on your specifications. Fast growing suburban area in S.E. Southgate district, Portland. Contact Mr. Roy Van Pelt, York Realty, 401 S.E. 81st Avenue, ALpine 4-1774, Portland 15, Oregon.

TETANUS-DIPHTHERIA TOXOID PROTECTS PATIENTS 8 TO 80 WITHOUT SERIOUS REACTION

Adult **DIP-TET*** Alhydrox®
/CUTTER

Even though the value and efficacy of immunization against tetanus and diphtheria has been proved[1,2] beyond infancy and early childhood, planned programs have been difficult because of increased reactions to pediatric toxoids. New Adult Dip-Tet now makes it safe for doctors to provide booster injections through the teen age years and into adulthood.

The safety of Adult Dip-Tet in the continuation or reestablishment of immunity, even in mature adults, is borne out by the fact that the Armed Forces have used a similar tetanus-diphtheria toxoid combination successfully in a program of routine and booster injections since 1955.[3,4]

Cutter Adult Dip-Tet Alhydrox provides safe immunization for patients 8 to 80 because . . .

- **The diphtheria component is highly purified and is present in a small concentrated dosage to reduce reactivity.**
- **The tetanus toxoid component has also been purified to reduce reaction.**
- **The toxoids are adsorbed on Alhydrox (aluminum hydroxide) to provide the effect of small, repeated doses.**

CELONTIN® KAPSEALS®

(methsuximide, Parke-Davis)

MEDICAMENTA VERA

PARKE, DAVIS & COMPANY

Clinical experience[1,2,3] indicates that CELONTIN:

- provides effective control with minimal side effects in the treatment of petit mal and psychomotor epilepsy;
- frequently checks seizures in patients refractory to other medications;
- has not been observed to increase incidence or severity of grand mal attacks in patients with combined petit and grand mal seizures.

Optimal dosage of CELONTIN should be determined by individual needs of each patient. A suggested dosage schedule is one 0.3 Gm. Kapseal daily for the first week. If required, dosage may be increased thereafter at weekly intervals, by one Kapseal per day for three weeks, to maximum total daily dosage of four Kapseals (1.2 Gm.).

multi-benefits of
LIPO-HEPIN* 200
sodium heparin U.S.P. aqueous

protect these vital areas in acute thrombo-embolic episodes

prolonged anticoagulant effect

Lipo-Hepin 200 — 20,000 U.S.P. Units (200 mgs.) per cc. — offers immediate effect (intravenously) and prolonged effect (fat tissue), without the disadvantages associated with gel heparin preparations.

ease of administration

The high concentration of Lipo-Hepin 200, and the recommended dosage schedule, significantly lessens the patient-to-patient response variations.

ease of control

The action of Lipo-Hepin 200 is definite and predictable. The suggested 12 or 24 hour regimen allows convenient intervals for clotting times if desired.

optimum lipolysis

Lipoprotein lipase, as accentuated by Lipo-Hepin, allows prevention and correction of certain lipid accumulations associated with atherosclerotic disease.

economical therapeutic management

Immediate, positive and prolonged action . predictability and safety . . . anticoagulant and lipolytic effect . . significantly reduced patient cost. Lipo-Hepin is indicated for acute, convalescent and prophylactic therapy

availability

200, 100, 50, 10 mgs. per cc in various size vials.

ACHROCIDIN*

TETRACYCLINE-ANTIHISTAMINE-ANALGESIC COMPOUND LEDERLE

A versatile, well-balanced formula offering in one tablet the drugs often prescribed separately for treating upper respiratory infections.

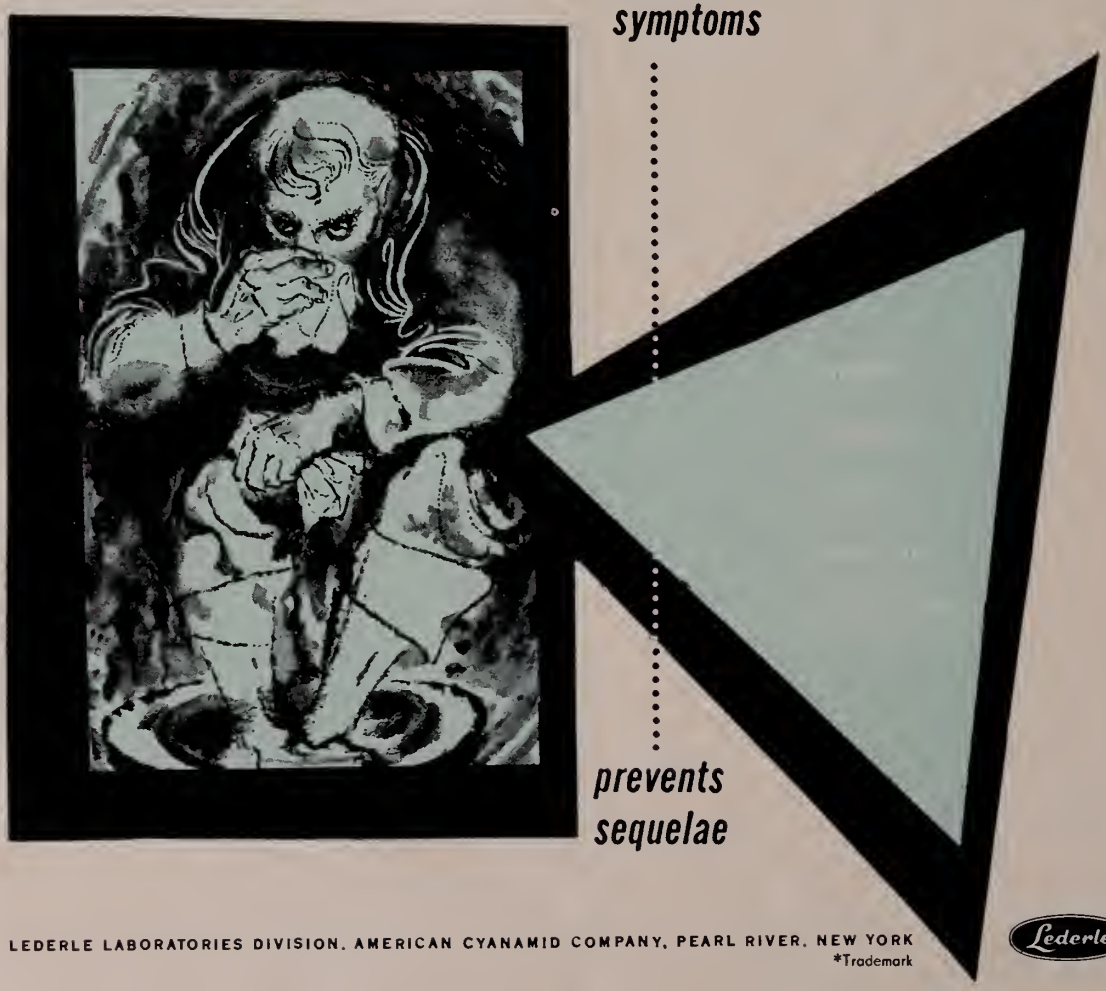
Traditional and nonspecific nasopharyngeal symptoms of malaise and chilly sensations are rapidly relieved, and headache, muscular pain, and pharyngeal and nasal discharges are reduced or eliminated.

Early effective therapy is provided against such bacterial complications as sinusitis, otitis, bronchitis and pneumonitis to which the patient may be highly vulnerable at this time.

Adult dosage for ACHROCIDIN Tablets and new, caffeine-free ACHROCIDIN Syrup is two tablets or teaspoonfuls of syrup three or four times daily. Dosage for children reduced according to weight and age.

Available on prescription only.

TABLETS *(Sugar-coated)*
Each tablet contains:



ACHROMYCIN® Tetracycline	125 mg.
Phenacetin	120 mg.
Caffeine	30 mg.
Salicylamide	150 mg.
Chlorothen Citrate	25 mg.

Bottles of 24 and 100

SYRUP *(Lemon-lime flavored)*
Each teaspoonful (5 cc.) contains:

ACHROMYCIN® Tetracycline equivalent to tetracycline HCl	125 mg.
Phenacetin	120 mg.
Salicylamide	150 mg.
Ascorbic Acid (C)	25 mg.
Pyrilamine Maleate	15 mg.
Methylparaben	4 mg.
Propylparaben	1 mg.

Bottle of 4 oz.

like the orchid,

L. A. FORMULA

is still unsurpassed

L. A. FORMULA *normalizes* bowel function. It is equally effective in correcting simple constipation and non-specific diarrhea. It is ideal, therefore, in the Irritable Colon cases in which both constipation *and* diarrhea may occur.

L. A. FORMULA is a vegetable concentrate of naturally occurring hemicelluloses. It is derived from blond psyllium seed by our special Ultra-Pulverization Process and simultaneously dispersed in lactose and dextrose. It provides just the moist, smooth, effective bulk so essential to normal peristalsis.

L. A. FORMULA is not to be confused with the ordinary laxatives, neuromuscular stimulants, or mucosal irritants. They *exaggerate* peristaltic activity. L. A. FORMULA *normalizes* it.

L. A. FORMULA, furthermore, is undetectable in fruit juice or milk, pleasant tasting in water, and available in 7 and 14 ounce prescription containers at significantly lower cost-to-patient prices.

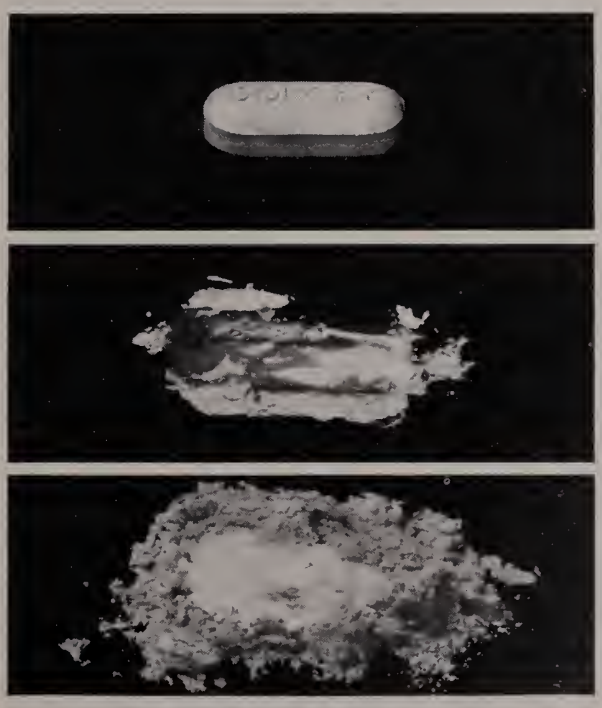
Consistent Gains in Functional Capacity Can Be Achieved with Conservative Therapy

The unemployable arthritic once again may undertake full employment and normal recreation. Patients once confined to the home or wheel chair often find it possible to engage in light work. And even bedridden patients can walk with comfort again. These are the benefits of conservative therapy as demonstrated in long-term studies.[1,2,3] In fact, in these four-year comparative studies of salicylate and cortisone, the corticoid showed no superiority over conservative therapy.

Superior Conservative Therapy Provided by Buffered Pabirin

Buffered Pabirin epitomizes modern, conservative therapy without the serious complications of corticoid therapy. Adrenal atrophy, peptic ulcers, moon-face, hypertension or psychotic reactions, a constant risk whenever corticoids are used,[4-7] will not occur with Buffered Pabirin. Month after month, Buffered Pabirin can be administered with a minimum of problems to patient and physician, and without the side effects common to the use of salicylates alone.



Buffered Pabirin combines new form and formulation for faster pain relief, improved gastric tolerance

Each tablet of Buffered Pabirin consists of an outer layer containing a buffer (aluminum hydroxide), para-aminobenzoic acid and ascorbic acid; an inner core of aspirin. The outer layer quickly releases aluminum hydroxide which affords superior buffering action and protects against gastric irritation. The core of Buffered Pabirin then disintegrates rapidly, permitting fast absorption of acetylsalicylic acid. PABA potentiates the acetylsalicylic acid and creates high salicylate blood levels. Ascorbic acid counteracts vitamin C depletion.

The new form and formulation of Buffered Pabirin provides high and sustained salicylate blood levels. It may be administered over long periods of time without the nausea, dyspepsia or other gastrointestinal symptoms so frequently experienced with salicylates alone.

in osteoarthritis, gouty arthritis, rheumatoid arthritis, bursitis, fibrositis, or tendinitis

EDITOR, NORTHWEST MEDICINE:

Our high school library is most interested in building back files of *Today's Health*. While we are subscribers to *Today's Health*, various factors have made it impossible until now to retain back issues.

We would consider it a great favor if you would publish an appropriate notice in an early issue of NORTHWEST MEDICINE to the effect that we will be happy to receive back issues of *Today's Health* to 1950. We will reimburse all donors for postage or express charges if they will drop us a card first to be sure we haven't already received the issues offered.

We can assure you that these magazines will receive good use by our health and science classes in research and project work, for *Today's Health* is completely indexed in *Abridged Readers' Guide*, to which we have subscribed for many years and have complete files on back to 1948.

Yours very truly

"...an ideal LOCATION!"

Like the hub of a great wheel, the Medical-Dental Building stands at the center of Seattle's transportation network and downtown shopping area. It is connected by passageway with the West's largest department store—within two blocks of off-street parking for over 5,000 cars. Such a location may benefit *your* practice.

Medical Dental Building

SEATTLE, MAin 4984 • METROPOLITAN BUILDING CORPORATION, MGRS.

WHEN YOU TREAT INFECTIONS IN PATIENTS SUCH AS THESE

- debilitated
- elderly
- diabetics
- infants, especially prematures
- those on corticoids
- those who developed moniliasis on previous broad-spectrum therapy
- those on prolonged and/or high antibiotic dosage
- women—especially if pregnant or diabetic

the best broad-spectrum antibiotic to use is

MYSTECLIN-V

Squibb Tetracycline Phosphate Complex (Sumycin) and Nystatin (Mycostatin)

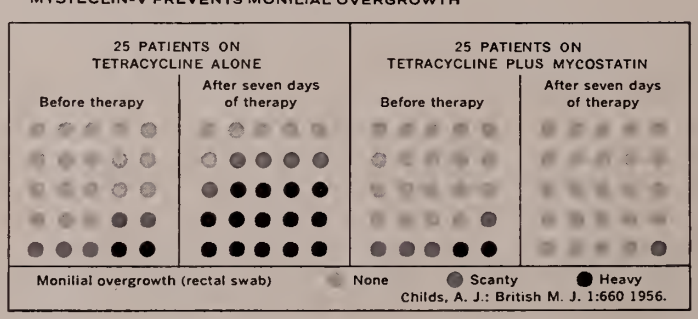
Sumycin plus Mycostatin

for practical purposes, Mysteclin-V is sodium-free

for "built-in" safety, Mysteclin-V combines:

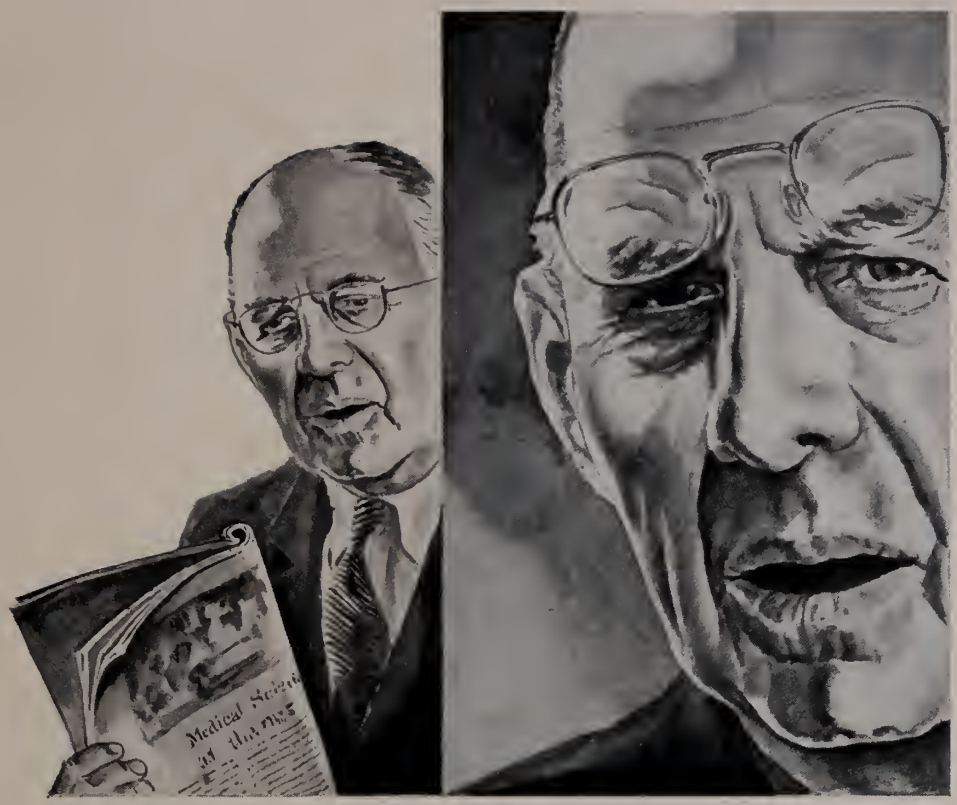
1. Tetracycline phosphate complex (Sumycin) for superior initial tetracycline blood levels, assuring fast transport of adequate tetracycline to the infection site.

2. Mycostatin—the first safe antifungal antibiotic—for its specific antimonilial activity. Mycostatin protects many patients (see above) who are particularly prone to monilial complications when on broad-spectrum therapy.



Capsules (250 mg./250,000 u.), bottles of 16 and 100. *Half-Strength Capsules* (125 mg./125,000 u.), bottles of 16 and 100. *Suspension* (125 mg./125,000 u.), 2 oz. bottles. *Pediatric Drops* (100 mg./100,000 u.), 10 cc. dropper bottles.

SQUIBB



Squibb Quality—the Priceless Ingredient

"MYSTECLIN,"® "MYCOSTATIN," ® AND "SUMYCIN" ARE SQUIBB TRADEMARKS

MYSTECLIN-V PREVENTS MONILIAL OVERGROWTH

Childs, A. J.: British M. J. 1:660 1956.

"Doctors can't help shingles?"

Physicians who have used PROTAMIDE extensively deplore such statements as unfortunate when they appear in the lay press. They have repeatedly observed in their practice quick relief of pain, even in severe cases, shortened duration of lesions, and greatly lowered incidence of postherpetic neuralgia when PROTAMIDE was started promptly. A folio of reprints is available. These papers report on zoster in the elderly—the severely painful cases—patients with extensive lesions. PROTAMIDE users know "shingles" *can* be helped.

PROTAMIDE®

Sherman Laboratories
Detroit 11, Michigan

Available: Boxes of 10 ampuls—prescription pharmacies.

ALL QUIET ON THE COUGHING FRONT

"COTHERA"®

SYRUP

®Brand of Dimethoxanate hydrochloride

NEW COUGH MODERATOR

SPECIFIC ANTITUSSIVE...

"COTHERA" moderates intensity and frequency of coughing through a selective action apparently on the medullary cough center . . . subdues but does not abolish the cough reflex. The natural reflex for removal of secretions is retained.

ACTS WITHIN MINUTES—LASTS FOR HOURS...

"COTHERA" provides a local anesthetic and soothing demulcent action to induce almost immediate relief of 'sandpaper' throat and 'annoying tickle'. . . followed by sustained moderation of the cough reflex, lasting for four to six hours and frequently throughout an entire night with one dose.

NON-NARCOTIC...

"COTHERA" is nonaddictive; does not cause respiratory depression, gastric irritation, or constipation. It is well tolerated by children and elderly patients, even after continued use. (Antitussive action is equal to ¼ gr. codeine per teaspoon dose.)

GUARDS AGAINST BRONCHOSPASM...

"COTHERA" exerts a mild musculotropic spasmolytic action tending to protect against possible harmful effects and cough-aggravation of bronchospasm.

CHERRY-FLAVORED...

"COTHERA" is completely acceptable to all age groups.

Indications: "COTHERA" Syrup is specifically indicated for irritating, useless, or chronic coughs such as those associated with the common cold, children's diseases, excessive smoking. It may be used safely for short-term or prolonged treatment.

Dosage: Adults and children over 8 years — 1 to 2 teaspoonfuls (25-50 mg.) three or four times daily. Children, 2 to 8 years—½ to 1 teaspoonful three or four times daily.

Supplied: 25 mg. per 5 cc. (teaspoonful), bottles of 16 fluidounces and 1 gallon.

Synatan employs DURABOND*

- a true repository technic for prolonging therapy from a single dose of oral medication
- technic is a depot action analogous to that of long-acting protamine-zinc insulin . . . a large molecular polyionic complex acts as a bonding agent
- employs no resins, wax or enteric coatings of any kind . . . release is independent of intestinal motility or specific pH
- provides prolonged, gradual, uniform amphetamine release with no peaks or valleys of activity . . . no sudden bursts of drug release
- incorporates no "drug traps" — the amount of drug given is the amount of drug released, and all is available for absorption
- provides greater anorexic action while minimizing overstimulation

Synatan contains tanphetamin (dextroamphetamine tannate) 17.5 mg. in a Durabond tabule. *Also available*—SECO-SYNATAN®, Synatan plus secobarbital in a Durabond tabule.

Dosage—1 or 2 tabules at 10 a.m. for all-day control. For prescription economy prescribe in 50's.

To serve your patients today—call your pharmacist for any additional information you may need to help you prescribe Synatan and Seco-Synatan.

Neurosis and Creativity

Several months ago the writer of a letter published on the correspondence page of the *Saturday Review* expressed thanks to the Deity for neurotics. He seemed to be convinced that they were responsible for most human progress, not only in art and literature but in almost every field of endeavor. It has remained for *Guy's Hospital Gazette* to publish an inquiry into the dependence of creativity on neurosis. J. S. Cameron, author of an article Neurosis and the Arts in the December 21 issue of that journal, does not arrive at any very definite conclusions but asks his readers to treat the word *neurotic* with a little more respect. It may be connected with man's highest function—creation.

He notes that the relationship of creativity to inner turmoil may be incidental, parallel, sequential or antagonistic. Incidental appearance of the two phenomena he throws out since stigmata of instability appear too frequently in the works of literature geniuses to lead one to theory of chance. The idea of parallelism is not given much credence since it would need to relie on the presence of a condition providing both neurosis and creation. Some feel that neurosis is a handicap but Cameron denies this, stating that neurosis may be a source of great power. Apparently he leans toward the sequential theory.

Artistic drive may be irrational in the same manner, and possibly for the same reasons, that neurotic behavior seems irrational. In the neurotic, a simple danger signal may evoke an emotion quite out of proportion to the stimulus which triggered it. Source of energy for the outburst may be, and usually is, unknown to the victim as well as to his observers. Hence the appearance of irrationality: "The artistic drive is likewise irrational. The artist is seeking a solution of difficulties never resolved, seeking hopelessly and yet with enormous vigor; a vast unthinking drive to solve just one little problem of the human predicament. This holds with artists of great breadth and facility of expression, and equally for those unfortunate inarticulates who succeed only in being pitiable."

Proust, whom Cameron describes as one of the great neurotics of literature, knew the source of his own ability and indicated that only those who suffered could produce. Cameron recognizes that suffering is not confined to neurotics but he realizes that they undoubtedly suffer more deeply and more constantly than those well integrated. Thus they examine themselves and their surroundings with senses rendered more acute by their tortures.

Freud could hardly be left out of the discussion. He is quoted on the origin of neuroses, "It seems that all neuroses (except traumatic neuroses) are only acquired in childhood up to the age of six." Cameron feels that this is an important observation since great creative artists go right on creating until death. Advanced age does not diminish their ability. Although some might attribute productivity to sexual drive or the drive for power, he notes that artistic drive continues long after those forces have usually

burned out. Thus it must stem from an influence planted at an early age to continue through all of life.

The question of normality of neurosis is raised. Some believe that everyone is neurotic in some way. Thus there is a problem in determining how much neurosis may be considered normal and what amount renders the sufferer abnormal. Cameron avoids drawing a precise line between the two. Perhaps, in order not to aggravate our own neuroses, it is better just to leave it that way. •

Wound Infection

One person on the surgical staff of each hospital should be made responsible for careful study of wounds, according to Meleney and Foman, in *The American Surgeon* for October 1957. They make this as one of many recommendations after studying wound infections at a Miami, Florida, hospital. The staff member assigned would obtain information on the progress of wound healing of every surgical patient, the type and severity of all complications, the bacteriologic studies and the measures taken to control infection. Regular reports would be made to the surgical staff.

Unless such studies are made, no one knows his own incidence of infected wounds or the importance of the hospital problem. Impressions are not enough.

Surgeons should be chagrined that, 90 years after Lister pointed the way to control of surgical infections, wounds still become infected because of breaks in technique. Meleney and Foman found a surprisingly high incidence of infections and many which could have been prevented. As might be expected, highest rate was in patients subjected to contamination before admission to the hospital. In these patients, 23.9 per cent of the wounds became infected. More surprising is the figure for wounds infected at the time of operation. It was 22.5 per cent. More disturbing is the fact that wounds in 10 per cent of clean cases became infected.

Their studies of the time and manner of introduction of organisms in the clean cases revealed facts which should be significant to those responsible for conduct of affairs in the surgical suite. Contamination occurred in the operating room in one-fourth of the cases. In another quarter of the cases it could have occurred either in the operating room or at the time of subsequent dressings. In another quarter it could have happened in the operating room or organisms could have been carried to the wound by lymphatics draining nearby infected areas. The surgical suite escaped implication in only one-fourth of infected wounds. These were determined to have been contaminated at the time of postoperative change of dressings.

Contamination at the time of operation was judged to have come from the intestinal tract in some cases and to have resulted from organisms dropping into the wounds in others. Plates exposed in operating rooms indicated much greater air contamination during the time the room was in use than when it was idle. Nose and throat cultures revealed that 50 per cent of operating room personnel were carriers of pathogenic organisms. Some surgeons failed to cover the mouth and nose completely. Many of the masks used were considered inadequate. Flagrant breaks in sterile technique were not observed although there were some deficiencies in scrubbing methods used by some individuals.

Errors were observed much more frequently when dressing methods were studied. Exudates from infected wounds were allowed to seep through dressings permitting spread of organisms. Masks and gloves were not worn frequently by those changing dressings and the dressing materials themselves were often applied with hands rather than with sterile instruments. There was evidence of carelessness in handling dressing materials, needles, instruments and syringes.

The authors found that the laboratory was not always used to determine type and sensitivity of organisms present and that antibiotics were not always used on the basis of specific informa-

tion. They urged prompt bacteriologic study of every wound showing infection or known to have been contaminated, followed by adequate use of the indicated antibiotic.

They recommend local use of neomycin and bacitracin, which are synergistic, in wounds known to be contaminated or in which contamination is observed, while awaiting precise information from the laboratory. Polymixin is suggested as an addition in burns since pseudomonas organisms are frequent contaminators.

Meleney and Foman urge adoption of stringent rules for the surgical suite. No person should be permitted to enter an operating room without having mouth and nose covered with an adequate mask and without proper cover for shoes. Helmets are preferred to caps. Masks should be four-ply with impermeable lining of cotton, flannel or plastic. All persons in the operating room should have nose and mouth covered at all times. This regulation should include the anesthetist. Masks should not be removed by anyone at any time while in the operating room. Entrance to the room should be through the scrubroom door. Doorway to the corridor should be used only for movement of the patient.

The surgical staff should be aroused to the need for tightening up all along the line. "Sterile conscience" and "sterile sense" should be kept in mind. Careful scrubbing, adequate masking, proper use of operating room clothing, rigid adherence to operating room discipline, use of masks and gloves in dressing open wounds, prompt use of antibiotics and prompt bacteriologic studies on wounds already contaminated or those infected while the patient is in the hospital—all contribute to reduction in the incidence of wound infection which is still unnecessarily high. •

Understanding

It has been fashionable, in recent years, to lament the fact that the physician is no longer accorded the adulation he formerly received. The doctor was once the most respected citizen in any community. He might have known little but he understood much. Today the doctor knows a great deal more but it may well be that he understands less. And it may well be also that the respect he is given stems more from his understanding of humans than from his knowledge of the many sciences which constitute medicine today.

Current popularity of psychiatric treatment, the astounding demand for tranquilizing drugs and the national hysteria which follows disturbing news—all indicate great unmet human needs. They cannot be met by an analysis of a battery of laboratory tests followed by prescription for the latest chemical miracle. If met by medicine at all, they must be met by the understanding which was the art of the highly respected physician of former yeras.

Levitan, in his article in this issue, emphasizes the inadequacy of medical practice which approaches the patient on the basis of microscopy, microbiology, pharmacology and chemistry. It is obvious that his knowledge, like that of all present day physicians, encompasses these things and many more. But it is also obvious that he is attempting to go beyond the sharp boundaries of these sciences. It is clear that he is trying to understand and meet the needs of his patients.

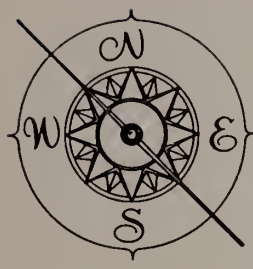
Levitan's article is more than just a listing of a few diseases that may not exist. It is more than a rebellion against too much science in medicine. It is more than condemnation of the physician who treats because he obtains profit from treating. What he has done is to point out that science has not yet developed far enough to be able to weigh in the variables of personal reaction. The test tubes and the colorimiters cannot fathom the human mind or determine just how it is disturbing the body which bears it. Those are processes which, so far at least, need another human mind, trained to understand as well as to know.

Restoration of the physician to his former position of respect will come when he not only knows but also understands. •

the bactericidal action makes the difference

In addition to rapid clinical response, 'Ilotycin' provides the important advantages only a bactericidal antibiotic can give you. 'Ilotycin' effectively eliminates strep. carrier states, directly kills pathogens to prevent the emergence of resistant strains, and offers maximum assurance against spread of infection.

Also consider 'Ilotycin' for safer therapy. Allergic reactions following systemic treatment are rare. Bacterial flora of the intestine is not significantly disturbed.



You can achieve more complete antibiotic therapy with 'Ilotycin.'

Usual adult dosage is 250 mg. every six hours.

*'Ilotycin' (Erythromycin, Lilly)

Hormones and Cancer

SIR STANFORD CADE, K.B.E., C.B.
LONDON, ENGLAND

Treatment of cancers of the breast and prostate is an indirect attack aimed at creation of a physiologic state inimical to their growth. Adrenalectomy and hypophysectomy are the only methods available offering possibility of regression of disseminated cancer otherwise untreatable and beyond hope. Usefulness of the method is limited by hormone-dependency of the tumour.

The most remarkable and far reaching advance in the knowledge of the natural history of cancer is the observation that there exists a relationship between certain cancers and the hormonal state of the patient. This observation suggests that cancer is not always an autonomous state, independent of normal physiologic processes. In practice it has been observed that a modification of the hormonal state of the patient may lead to a regression of widespread disseminated tumours.

This hormonal relationship applies only to cancer of the breast and prostate. There is no evidence so far that any other cancer can be influenced by a change in the hormonal environment.

Experimentally it has been shown in animals that cancer can be induced by hormones and equally that cancer can be made to regress by alteration of hormone secretions. In 1932 Lacassagne succeeded in producing mammary cancer in male mice by repeated injections of oestrogens. This experimental finding has been confirmed by many workers since. Animal experiments have also shown that removal of the ovaries reduces the incidence of spontaneous development of breast cancer in susceptible strains and that the incidence of mammary cancer in mice can be increased by oestrogens and also by transplantation of the anterior hypophysis.

The chemical structure of naturally occurring oestrogens was determined in 1930 and the synthetic production of oestrogens was achieved a few years later. Oestrogens were detected in normal males, the source being the testis. The urine of stallions, testicular tumours in dogs, milk, eggs and other articles of diet were found to be a source of oestrogens.

The first oophorectomy for advanced breast cancer was done by George Beatson in 1896. It has since been repeatedly shown that removal of the ovaries may prove a restraining influence on the progress of breast cancer. X-ray induced menopause following irradiation of the ovaries has also been frequently practised, but surgical castration is more rapid, more complete and more constant in its effects. It is also reported that the incidence of cancer of the breast is rarer in castrated women than in the normal.

The hormonal treatment of prostatic cancer consists in the withdrawal of androgens by cas-

Fig. 1. Efect of androgen on osteolytic metastasis from breast cancer.

tration or the administration of oestrogens. The hormonal eontrol of mammary cancer is more complex, sometimes apparently irrational and always unpredictable in its effects.

The methods of hormone therapy which follow oophorectomy are: Androgen therapy, oestrogen therapy, adrenalectomy, hypophysectomy and cortisone administration.

Androgen Therapy

The effect of male hormones in breast cancer was first published in 1939 by Ulrich and by Loeser. Popular interest in this subject was delayed by the war and by the scarcity of synthetic male hormones. In 1946 Adair of the Memorial Hospital, New York, published his series of androgen-treated breast cancer and this method of treatment became popular. In the past 17 years there has accumulated a considerable amount of evidence as to the value of androgen therapy.

The effect of testosterone in many eases of breast cancer, about 30 per cent, is remarkable. Symptomatic relief of pain is dramatic in the successful cases; recalcification of osteolytic metastases and shrinkage of visceral metastases in the liver, lungs, and soft tissues is equally impressive. Radiologically occult skeletal lesions become evident by an increased density of bone.

The improvement is temporary, lasting between 6 to 18 months, but in a few cases prolonged survival up to 8 years has been achieved in the older age groups. Yet the method of androgen therapy remains the least desirable. The anabolic effects produce symptomatic improvement: increased appetite, improved blood count, gain in weight and sense of well being. Yet the side effects often outweigh the benefits. Virilism varies from patient to patient and does not always correspond with the dose. Deepening of the voice, hirsutism, eroticism, baldness, amenorrhoea and muscular hypertrophy transform the patient into a male caricature of herself.

The electrolyte balance may be upset by sodium and water retention and any preexisting oedema or cardiac disease and pleural effusion

Fig. 3. Effect of oestrogens on local recurrence of breast cancer.

or ascites are aggravated. The most serious side effect is hypercalcaemia and renal failure which may rapidly prove fatal.

On balance, the indications for androgen therapy are few. In pre-menopausal women, surgical or radiologic castration should be tried first. In the older age group, it is indicated as a test treatment in cases considered for adrenalectomy If, however, the response to treatment is favourable and the side effects moderate, treatment by androgens is continued. The average benefit is of 6 to 18 months.

Oestrogen Therapy

The first trial of oestrogens in mammary cancer was made by Haddow and his co-workers, and the results were published in 1944. The treatment of breast cancer by oestrogens is empirical and the mode of action is unknown and in fact seems paradoxical if the beneficial effect of androgens is considered to be anti-oestrogenic. It is possible that the oestrogen effect is due to pituitary suppression.

The effects are well-known: ulcerating primary tumours, local postoperative recurrences, satellite nodules regress and sometimes disappear completely. The effects on skeletal and visceral metastases are less frequently obtained and take longer to manifest themselves than after androgens.

The use of oestrogens is now usually reserved for the older age group, at least 5 years post-menopausal. There are, however, recorded cases of great improvement in pre-menopausal women. Like androgens, oestrogens often produce symptomatic relief of pain and subjective improvement. The side effects are different and less distressing than those following androgens: vaginal bleeding, pigmentation of areolae, axillae and vulva; nausea and vomiting and occasionally hypercalcaemia and renal failure.

The indications for oestrogens are cancer of the breast in all stages in the very old—over 75 years of age—and as the first hormonal trial in disseminated cancer in post-menopausal women. It is contraindicated in patients whose metastases have regressed following oophorectomy. In all cases oestrogens should in the first instance be tried cautiously, as aggravation of disease may result in the hormone-dependent patients. This aggravation by oestrogens has been used by Emerson and Jessiman as a test for hormone-dependency.

The average period of improvement with oestrogens is similar to that with androgens, 6 to 18 months. The percentage of patients who respond

to oestrogens increases with the age of the patient. The longer after the menopause, the more likely the patient is to respond to treatment. The uterine bleeding may be controlled by increasing the dose of oestrogen. Withdrawal bleeding is well-known. If bleeding is severe, progesterone should be given by intramuscular injection for a few days.

Corticoid Therapy

Attempts to produce tumour regression by the use of cortisone, hydrocortisone and prednisone have been made in many centres. Large doses of cortisone, 200 mg. daily, have been tried by Pearson and his colleagues at the Memorial Centre, New York. Objective remission was obtained in about 30 to 50 per cent of patients but was of very short duration, only 3 months. Smaller doses, 50 to 100 mg. daily of cortisone, were found by others to be equally effective. Prednisone in 10 to 25 mg. daily by mouth is preferable as it causes less sodium retention and less potassium loss. The effect of these corticoids may be due to their suppressive action on the adrenals or on the pituitary. There is no evidence of any direct tumour suppressive action but their palliative value is considerable. Their main indication is in cases of hypercalcaemia, either spontaneous or as the result of androgen or oestrogen therapy.

Fig. 4. Skeletal pelvic metastases from breast cancer. Before and 2 years 3 months after adrenalectomy and oophorectomy. This patient remains well to date, 4 years and 2 months after adrenalectomy.

The favourable response to cortisone or prednisone, like the activation effect of oestrogens or androgens, is considered to be an indication of hormone-dependency and may be used as a test for suitability for adrenalectomy. It is not recommended as the initial treatment except in very critically ill patients.

S. G. Taylor of the Presbyterian Hospital in Chicago found that corticoids are of value in the control of neurologic symptoms due to cerebral metastases as well as for replacement therapy and as a stimulant of the bone marrow, and in cases of radiation pneumonitis. Although the use of cortisone and prednisone is not comparable to that of other hormones, it is of considerable palliative value and relieves discomfort from the inflammatory reaction around the primary tumour, in lymphoedema and in jaundice from hepatic involvement. But its main value is in hypercalcaemia from extensive bone metastases and in intracranial deposits. Prolonged administration of the corticoids leads to the well-known side effects, such as Cushing's syndrome, moon face, slight hirsutism and acne. The most serious effect is the masking of infections and patients may develop an infection in the lungs or pleura without premonitory symptoms. Adrenal insufficiency may also result from prolonged corticoid medication.

Adrenalectomy

Charles Huggins (1945) was the first to suggest and to practise bilateral adrenalectomy, even before substitution therapy by cortisone became available. His work on the physiology of the prostate, leading to his observations on the effect of hormonal influence on prostatic carcinoma, attracted him to the study of the hormonal effects on breast cancer. Huggins' conception of

Fig. 5. Pleural and mediastinal metastases from breast cancer. Before and 3 months after bilateral adrenalectomy and oophorectomy.

hormone-dependency of breast cancer is based on two principles: (1) Cancer is not necessarily autonomous and self-perpetuating. Some cancers, such as prostatic and mammary, retain the properties of the normal prototype cell and function like these cells. Their activity depends upon hormonal support. (2) Cancer in certain sites can be sustained by normal hormonal influences in normal or even subnormal quantities. His experimental work and his clear clinical observations revealed the following four points:

(1) Gonadectomy is followed by compensatory hypertrophy of the adrenals and increased adrenocortical function.
(2) In men, the excretion of 17-ketosteroids is raised after castration and eliminated after adrenalectomy.
(3) In women, oestrogen continues to be excreted after oophorectomy and is often, although not always, eliminated by adrenalectomy.
(4) Ovarian endocrine function continues after the menopause.

These observations translated into clinical applications are the rationale of bilateral adrenalectomy and oophorectomy, which is the elimination of all or most known sources of sex steroids which can influence the growth of mammary cancer and so create a physiologic environment poor in steroids and inimical to the sustenance of cancer.

My own series of bilateral adrenalectomy for disseminated breast cancer now totals 180 patients and covers a period of five years. The mortality of the operation has diminished with increased experience and is now negligible. The adrenalectomised patients adequately maintained on substitution therapy are not incapacitated and are capable of leading a near-normal life. The effect of adrenalectomy is assessed by subjective and objective improvement. In widely disseminated cancer in a proportion of patients, such improvement has never been achieved before by any other form of treatment and has only been achieved since by hypophysectomy.

The effects of adrenalectomy can be summarized as follows:

A proportion of patients do not respond to adrenalectomy; they are the hormone independent tumours; their failure to respond is immediate and complete. The progress of the disease is not affected; they account for about 50 per cent of patients. When improvement is achieved, 58 per cent of patients show subjective improvement and 40 per cent objective improvement.

Subjective improvement is measured by the relief of pain, the return to an ambulatory state, an increased sense of well being, improved appe-

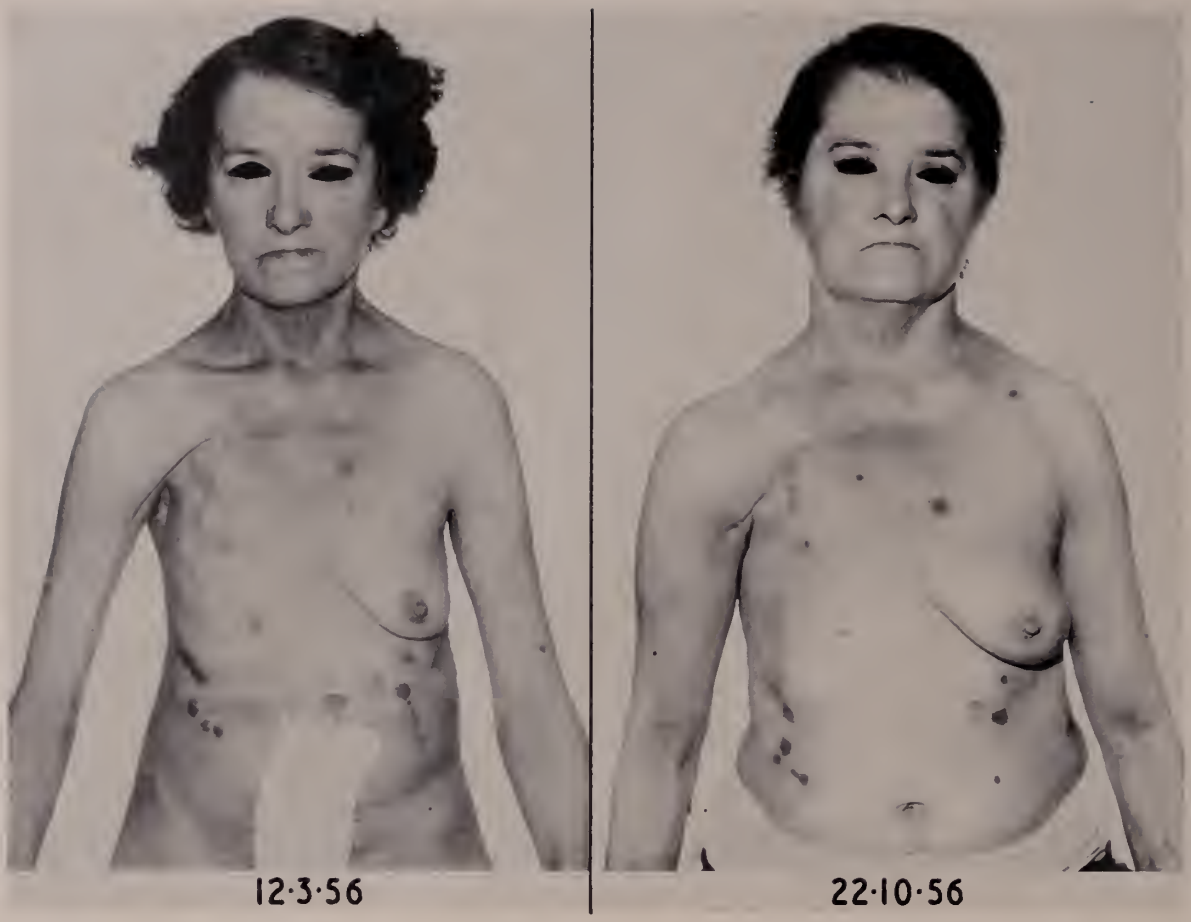

Fig. 6. Extensive skeletal metastases involving the entire skeleton. To illustrate the alteration in the patient's appearance and gain in weight 7 months after adrenalectomy. There was radiologic evidence of healing of all the bone lesions.

tite and a capacity to resume a near-normal existence including work.

Objective improvement is assessed by clinical and radiologic regression of lesions, union of pathologic fractures, recalcification of osteolytic deposits, disappearance or shrinkage of visceral metastases in the lungs, pleura, liver and eye. These favourable effects of adrenalectomy have been observed by Huggins and since then by many other surgeons. A series of cases was published by Pyrah and Smiddy from Leeds in 1954, by Pearson, Randall and others from the Memorial Centre and Sloane Kettering Institute in New York (1957) and many others. My own series (Cade, S., 1954, 1955, 1957) fully supports Huggins' original observations.

Tests to determine beforehand if any given patient is likely to benefit from adrenalectomy or not are still in the preliminary stages. Jessiman and Emerson suggest that aggravation of the disease by oestrogen, improvement by cortisone and estimation of the effects of oestrogen on calcium excretion in osteolytic lesions are of value. Assessment of the effects of previous treatment by androgens or oestrogens is of interest.

Aggravation of the disease by hormones is significant and indicates hormone-dependence, but a good response to hormones has proved a more favourable prognostic feature than no response. Neither age, nor histologic type of mammary cancer, rate of growth or extent of the disease are of prognostic significance.

The position to-day is that adrenalectomy is the last resort in disseminated cancer of the breast and that there are indications which suggest that earlier adrenalectomy is justifiable. The question, whether the alternative of hypophysectomy is preferable or not, cannot as yet be answered definitely. There are, however, some indications that further remissions of the disease can be obtained by hypophysectomy in previously adrenalectomised patients and I am inform-

ed by Huggins that the reverse is also true—that previously hypophysectomised patients have been known to obtain remissions after adrenalectomy.

Hypophysectomy

In 1951, R. Luft and H. Olivecrona of Stockholm began their studies of the effects of hypophysectomy on metastatic breast cancer. Their purpose was to achieve a complete elimination of steroid hormones. Hypophysectomy results in the elimination of the function of the adrenals, accessory adrenals, ovaries, thyroid and of the growth hormone (somatotrophic hormone) which has been shown to be of some importance in the control of cancer. By January 1956 Luft and Olivecrona had studied 75 hypophysectomised patients. Pearson and his colleagues (1954, 1956) at the Memorial Centre in New York reported 41 patients hypophysectomised for breast cancer with 50 per cent remission (in 90 per cent of patients). M. C. Falconer and his colleagues at Guy's, Radley Smith at the Royal Free Hospital, London, and many others have now shown that regression of disseminated breast cancer can be achieved by hypophysectomy in a similar manner to that obtained by adrenalectomy.

Other forms of pituitary suppression by radiation have been tried. A. P. M. Forrest and D. A. Brown in Glasgow described an ingenious method of interstitial radiation of the hypophysis by the intranasal route. Radon seeds and radioactive gold grains as a source of gamma radiation, and yttrium as a β emitter have been tried. John H. Lawrence and his co-workers in Berkeley, California, used the 184-inch cyclotron as a source of proton radiation to destroy the pituitary.

All these methods indicate that destruction of the pituitary is followed by inactivation of the thyroid, adrenals, ovaries and suppression of the growth hormone. The effects of hypophysectomy on disseminated breast cancer are similar to those of adrenalectomy, and regression of disseminated lesions can be achieved.

In the series of patients hypophysectomised by Olivecrona, 54 per cent showed subjective remission. Regression of skeletal, pleural, pulmonary and lymph node metastases was achieved. Average period of remission was 17 months. Hypophysectomy has also produced further remission in patients previously adrenalectomised. It is at present too early to speak with certainty of the comparative value of adrenalectomy and hypophysectomy.

Summary and Conclusions

The hormonal treatment of cancer of the breast and prostate is an indirect attack aiming at the formation of a physiologic state inimical to the growth of the tumour. By altering the internal carcinogenic environment, treatment can be effective regardless of the site, extent and dissemination of metastatic lesions. The usefulness of the method is limited at present by the hormone-dependency of the tumour and not by the particular site or even the extent of the lesions. It is the greatest advance yet in the treatment of cancer although much more remains to be done. Many questions remain unanswered, wrapped in the mystery of the biology of cancer. Why are some cancers hormonally dependent and others not? What causes the reactivation of lesions after periods of regression? Why are the results in prostatic cancer inferior to those in breast cancer? The chemical destruction of the adrenals and hypophysis may one day replace surgical ablation of the adrenals and the hypophysis, but as yet no such chemical compound is available.

It remains a fact that adrenalectomy and hypophysectomy are the only available methods which in a proportion of patients offer a possibility of regression of disseminated cancer otherwise untreatable and beyond hope. •

Inguinal Hernia

Part II. Surgical Technique

JOHN SONNELAND, M.D.
SPOKANE, WASHINGTON

Last month nonoperative principles of inguinal hernia were presented. It was pointed out that the death rate from the complications of inguinal hernia almost equals the death rate from peptic ulceration. The anatomy of the inguinal region was outlined, stress being laid on the fact that the primary material of repair is not the "conjoined tendon," but a fascial tissue representing a fusion of transversalis fascia with the caudal extension of transversus abdominus, this fused tissue being conveniently termed "transversalis fascia." About 50 per cent of recurrences were noted to occur through Hesselbach's area, the major share of these near the pubic tubercle. The causes of direct recurrent hernias are primarily failure to use the transversalis fascia, use of absorbable sutures, or excessive suture line tension. Indirect recurrences are undoubtedly due to failure to recognize an indirect sac, to narrow the internal ring, or to minimize cord bulk. Recurrence rates of 3 per cent or less are realized if surgery is executed with due regard for basic anatomy.

Surgical technique for the usual adult inguinal hernia is the subject of this paper. No thought is entertained of originality for many of the steps to be described. The operative technique is a condensation of what has seemed worth-while in the techniques of many surgeons with whom I have worked, personal adaptations, of course, being introduced at various points in the procedure.

The Dissection

Incision through a transverse skin line of Langer provides adequate exposure, a less painful wound, and a cosmetically better scar. The external ring is defined, and a finger passed through it, and then pressed laterally under external oblique aponeurosis. This usually separates the ilio-inguinal nerve from external oblique aponeurosis. An opened dissecting scissor is pressed along the same course, its under blade being visualized through external oblique to insure against injury to the adjacent nerve. The external oblique is usually opened more widely than necessary; a 2 inch incision is adequate. (See figures 1, 2.)

The cord and ilio-inguinal nerve are picked up as one structure as the index finger is passed firmly between them and the pubic tubercle. If care is not taken, the external spermatic vein is frequently ruptured at this point. It is found at the internal ring just medial to the bulk of the cord and has little ability to stretch, acting as a taut band to maximize the internal ring circumference. It is most prudent to clamp, cut and ligate the vein at the outset.

Cord lipomas or fat bodies should be removed to a level deep to the internal ring, ligating the base of each. This minimizes the cord bulk, and often makes readily apparent, if present, the indirect sac.

Treatment of the Sac

If an indirect sac is found, it is highly important, having opened it, to make a finger exploration of Hesselbach's area for a direct, and of the femoral ring for a femoral hernia. Failure to do so has been responsible for overlooking a direct or femoral component of a hernial complex of the inguino-femoral area.

If no indirect sac is evident but a direct sac is obvious, it may be opened on its lateral aspect, to avoid bladder injury, and finger exploration performed of the indirect and femoral areas. If

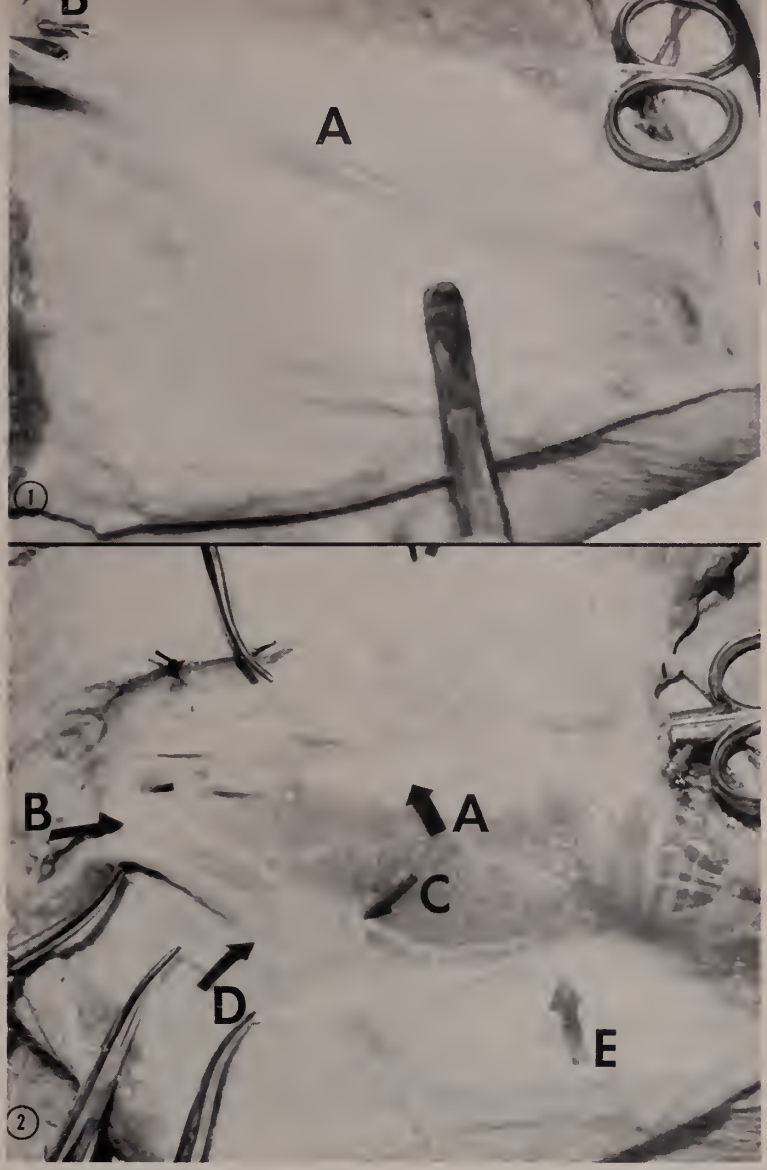

Fig. 1. Autopsy specimen of left inguinal region. Superficial tissues have been swept away from aponeurosis of external oblique. Observe: (A) Fibers of external oblique are loosely united and have little tensile strength when sutured at right angles to the fibers. (B) Scissors pressed against lateral margin of rectus sheath emerge just medial to pubic tubercle and spermatic cord (unprotected area between inguinal ligament and rectus margin is accordingly narrow and V-shaped). Fig. 2. Autopsy specimen. External oblique is severed laterally and held to demonstrate its insertion into rectus sheath. Observe: (A) External oblique inserts into midportion of rectus sheath (uppermost arrow indicates rectus sheath edge). Other pointers from above downward are: (B) pubic tubercle, (C) ilio-inguinal nerve between the oblique muscles, (D) shelving portion of inguinal ligament running parallel to spermatic cord, and (E) anterior superior iliac spine.

the sac is broad-mouthed (the usual circumstance) the peritoneal defect may be closed, and the sac simply invaginated through use of a row of interrupted or of purse-string sutures. It need not be resected, as this is an unnecessary step which could lead to bladder injury or troublesome bleeding. If the direct sac is narrow-mouthed, it should be treated by high ligation.

If an indirect sac is present in addition to either a direct or a femoral sac, the latter may be easily drawn into the indirect sac through traction on the indirect sac while dissecting bluntly with a gauze sponge.

What if no sac is evident? The peritoneal cavity should be entered at a point lateral to the estimated location of the bladder—i.e., either just medial or lateral to the epigastric vessels. Or, the latter may be interrupted and tied if exposure is limited in an obese person. Intraperitoneal finger exploration may then be accomplished. If negative, the patient's preoperative findings were probably due to prolapse of retroperitoneal fat through the internal ring. In this case the peritoneal defect is closed, the internal ring closed about a cord shorn of fat, and the transversalis fascia approximated to the inguinal ligament.

Special points on treatment of the sac need emphasis. A scrotal sac need not be dissected away from its entire bed—transection near the internal ring is entirely satisfactory. The distal sac is left open-mouthed and will not give diffi-

culty. Following dissection of the sac from the cord, vexing moments during high ligation of the sac may be remedied if the operator does not unduly stretch the sac to the point of drawing downward peritoneum, which, thinner than the sac itself, tears, and thereby makes closure difficult. If the sac is not unusually wide-mouthed, quick and easy closure of the sac may be obtained by a transfixion suture of a double strand of 2-0 cotton or silk—the suture is sewn into position, cannot slip, and if drawn tightly, will effect hemostasis when excess sac is trimmed away. The sac should be trimmed at a point about a centimeter distal to the suture ligature. Otherwise, when the stump retracts, portions of the peritoneum may slip free of the ligature. In large-mouthed sacs, best closed with several interrupted transfixion sutures, each closing a segment of the neck, the neck may be directed superiorly by a transfixion suture in which the two ends of the stump sutures are individually brought through the internal oblique and then tied (transfixion suture of Lockwood and Macewen).

Reconstruction of the Inguinal Floor

A frequently overlooked technical point is that of closure of the internal ring. The actual margins of the internal ring in transversalis fascia should be gently dissected away from underlying inferior epigastric vessels, and then approximated with interrupted sutures in order that the ring be narrowed. The ring should be narrowed until the very tip of the little finger just fits alongside the cord in the internal ring. The cord, of course, has been previously cleared of fat bodies, of the external spermatic vein and, when necessary, of bulky cremasteric fibers.

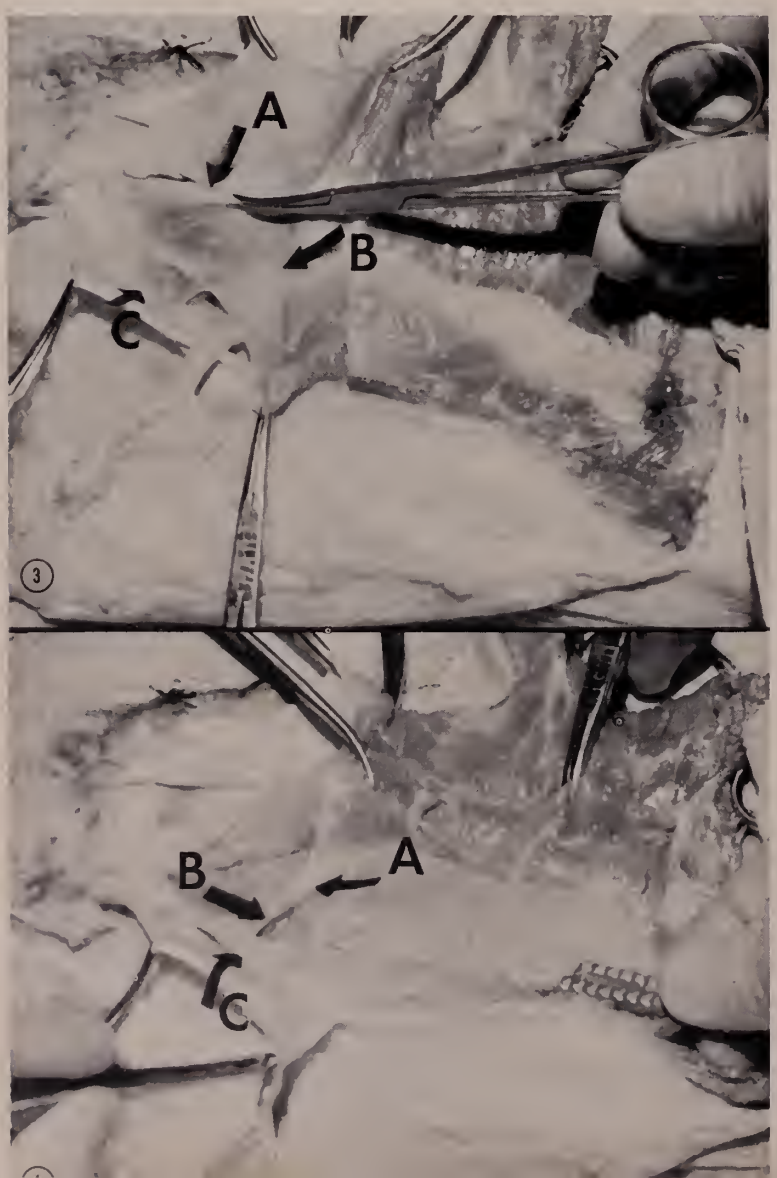

Fig. 3. Autopsy specimen. Internal oblique is severed laterally and held to demonstrate its union into rectus sheath. Observe pointers from above downward: (A) Lateral margin of rectus sheath, here held on stretch by hemostat (to be sutured to inguinal ligament). (B) Tissue representing fusion of caudal extension of transversus abdominus aponeurosis with transversalis fascia (suture needle should accept generous, though superficial bit of this layer). (C) Shelving portion of inguinal ligament, immediately adjacent to which is clearly defined internal ring (cord severed and displaced laterally). Anatomically, chief reasons for recurrence medially is failure to look for and approximate stout margin of rectus sheath to inguinal ligament and failure to look for and approximate transversalis fascia — transversus abdominus layer to inguinal ligament. A primary cause of failure for lateral recurrence is failure to dissect out and close anatomically the internal ring. Fig. 4. Autopsy specimen. Transverse abdominus is severed laterally and held to demonstrate its zone of fusion with transversalis fascia. Observe pointers from above downward: (A) Superior margin of internal ring at which point transversalis fascia begins to fuse with transversus abdominus as the united tissue extends across Hesselbach's area; inferior epigastric vessels seen indistinctly crossing ring, underneath cord. (B) Apex of internal ring. (C) Shelving portion of inguinal ligament with cord passing parallel to it.

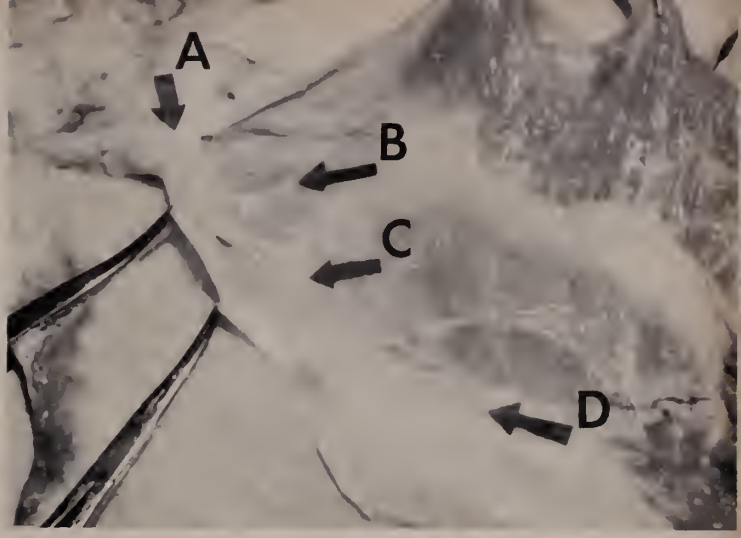

Fig. 5. Autopsy specimen. (A) Pubic spine, (B) Hesselbach's area, (C) cord emerging from internal ring, and (D) anterior superior iliac spine.

If, in indirect hernias, some weakness of Hesselbach's area is noted, it is well to imbricate the thinned transversalis fascia overlying it. This is done with a row of interrupted sutures of cotton or silk, usually 2-0. Similar material is then used to effect approximation of the previously discussed sturdy margin of transversalis fascia to the shelving margin of the inguinal ligament. The repair is altered but little for direct hernias—the internal ring is narrowed, the sac is imbricated, and the inguinal floor is reconstructed, the transversalis fascia being approximated to the inguinal ligament. In direct hernias, one may be more prone to use a Halsted I repair, overlapping the leaves of external oblique aponeurosis deep to the cord.

Inguinal floor reconstruction begins at the pubis. Initially, the sutures take a generous bite of both inguinal and Cooper's ligaments where they insert into the pubis, and then cross the defect to take *the lateral margin of the rectus sheath*. This is the prime area for recurrence in Hesselbach's area. After one or two such sutures, the following sutures will take the shelving edge of inguinal ligament, the needle *skimming* just under the strong fascia for perhaps a centimeter, and then passing across the defect to take an equal bite into the sturdy portion of transversalis fascia. (See figures 3, 4.) As each suture is placed, the bite on either side of the defect should be judged to be at a point equidistant from the apex of the "V," which is the pubic tubercle. This precaution will insure a well ordered suture row, in which each suture bears approximately equal stress. The sutures are placed about 6 to 7 mm. apart, so that should one break postoperatively, its neighbors would adequately maintain the repair. They are tied, of course, merely to *approximate* the tissues. There is no necessity to cut on the knots at this deep level in the wound; 2 to 3 mm. ends will insure against an undone knot.[1]

A longitudinal incision in the medial aspect of the rectus sheath, beginning 2 cm. above the pubis and skipping the nerves, is then made for a distance of about 5 or 6 cm.

Some operators feel strongly about the so-called shutter mechanism of the internal oblique. They place a row of sutures to approximate it to the inguinal ligament. Actually, if one goes sufficiently high enough under internal oblique to find the strong portion of transversalis fascia, and then approximates that fascia to the inguinal ligament, he will have incidentally brought internal oblique downward because of its muscle bundle insertions into transversalis fascia.

Quite uncommonly, one will find inadequate transversalis fascia, even on looking well under the internal oblique. In this situation any of numerous modifications may be used to bridge Hesselbach's area—metallic gauze, metal shield, free fascia lata graft, cutis grafts, or rectus sheath. I feel that rectus sheath is highly satisfactory and is immediately available. Two transverse incisions and a medial incision along the linea alba will free a flap for transposition across Hesselbach's triangle, and it may then be sewn to either the inguinal or Cooper's ligament. Supplementary imbrication of the leaves of external oblique may be of some help.

In the common hernia, a Bassini repair is usually sound, the cord being dropped on the layer of transversalis fascia to inguinal ligament, and the external oblique aponeurosis being closed over the cord. Care should be taken not to make too tight an external ring. If one wishes

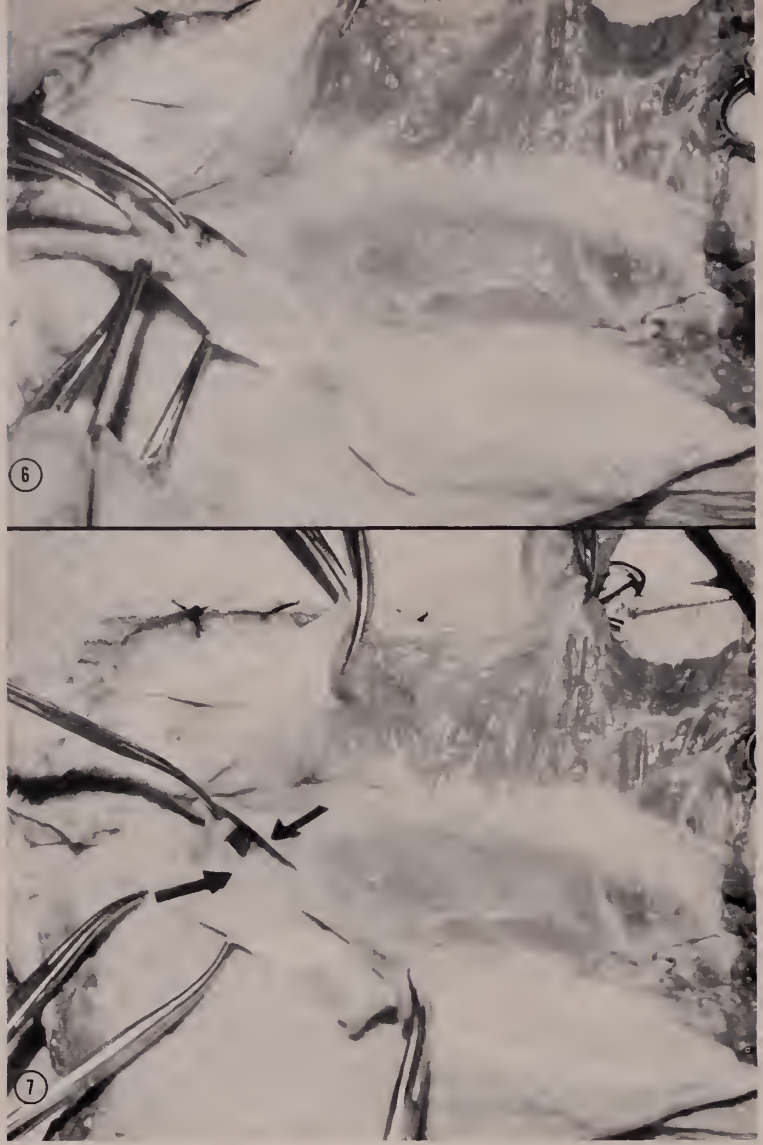

Fig. 6. Autopsy specimen. Illustrates very clearly the internal ring, with underlying epigastric vessels, and also shows the external spermatic vein held with a hemostat as it emerges just medial to the cord. Fig. 7. Autopsy specimen. With cord severed and retracted laterally, the internal ring margins are clearly shown.

to overlap the external oblique deep to the cord, some small measure of reinforcement may be obtained. Certainly the external oblique lacks strength, and is easily torn. Its value in herniorrhaphy possibly arises from scarring incidental to healing.

Summary

Repair of the usual adult inguinal hernia should begin with an anatomic, gentle dissection of the area, as thorough intraabdominal finger exploration of the inguinal-femoral area is performed. Conversion of multiple sacs into one should be performed, the sac being ligated securely deep to the transversalis fascia. The spermatic cord should be narrowed by division of the external spermatic vein, and removal of fat bodies and excessively developed cremasteric fibers. About the slenderized cord, the internal ring in transversalis fascia should be narrowed. With the cord elevated, the transversalis fascia should be sought out in its position under the internal oblique, and approximated with interrupted, nonabsorbable sutures to the inguinal ligament. The above steps constitute a sound repair in most cases. In unusual cases, modifications of closure may be of some value, using rectus sheath interposition or external oblique imbrication. •

Clinical Application for Hypnosis

Leslie M. LeCron, B.A.
Los Angeles, California

Ever since the days of Mesmer, two centuries ago, the medical profession—like the general public—has considered hypnosis as something mystical and mysterious, smacking of quackery, and best avoided. Within the last decade such prejudice and skepticism have undergone definite changes. Today, in the United States, nearly ten thousand physicians and dentists have learned hypnotic techniques and use them in practice. These men invariably have found their knowledge of this subject of great practical value to many of their patients and to themselves. For the first time in its history, hypnosis is becoming an acceptable tool in medicine and dentistry.

Recognition

First official acceptance of hypnosis by the medical profession came in 1955 when the British Medical Association adopted a resolution, following a report by an investigatory committee, stating that hypnosis was of definite value in the treatment of some conditions. Recommendation was made that its techniques be taught in all medical schools. Similarly, in the United States, a committee of the Council on Mental Health of the American Medical Association has been appointed to study the value of hypnosis clinically.

Throughout its modern history, hypnosis has been found to be of such value by a few leading physicians that they have faced the disapproval of their colleagues, and of organized medicine, and have held to its use. Although Mesmer himself was alleviating many illnesses of functional nature at a time when there was no other form of psychotherapy available, he was condemned by other medical men. After an investigation, the French Academy of Science reported adversely on his methods and the great interest his successes had aroused was efficiently quashed. Later, Elliotson, Esdaile and others in England were the subject of actual persecution because they used hypnosis. But their results were such that they refused to give it up.

The greatest interest in hypnotherapy came during the period from about 1880 to 1900 when physicians from all over the world traveled to Nancy to learn hypnosis from Bernheim, greatest French physician of his day, who had adopted it. This peak of medical interest subsided when Freud advanced his ideas embodied in psychoanalysis and obtained their acceptance.

Freud

Freud's early work had been conducted largely by means of hypnosis, but he later abandoned it. This was largely due to the fact that he was a very poor hypnotist. Because of lack of knowledge and of some of his own personality traits, he found that he frequently was unable to hypnotize a patient. Another reason for his giving it up was rivalry with his associate Breuer. Breuer was one of the finest and most successful medical hypnotists of his day. Because he could not tolerate failure when his rival was so successful, Freud turned to other techniques.

Freud's followers generally have believed that his turn to other methods indicated that hypnosis is not worth-while. Most analysts and psychiatrists who are followers of the Freudian school have, as a result, ignored hypnosis. Few have ever read anything on the subject. However, those who have learned its techniques have found it of the utmost value in psychiatry and psychotherapy. Many books and technical articles have been written to this effect. But, although many psychiatricts do use hypnosis, the percentage remains small. Other physicians have tended to follow psychiatrists in their belief that hypnosis is of little or no value or importance.

Increasing Utilization

Among physicians now using hypnosis, after learning its techniques, are some in every medical specialty as well as a great many general practitioners. As an indication of the increase in

Presented at the Hypnosis Symposium, Seattle, Washington, July 19-21, 1957.

its use, one prominent Los Angeles obstetrician has performed over 300 deliveries with the parturient under hypnosis, this within the past four years. It is doubtful if that many women in this country had been delivered under hypnosis during the entire prior half century. Newspapers in various sections of the nation, and medical journals, have reported many major surgical procedures performed under hypnosis without drug anesthesia. These have included lung resection,[1] cardiac operation,[2] cesarean section,[3] complete hysterectomy,[4] brain operations,[5,5a] and many others.[6-11]

Today, every physician is aware of the psychosomatic aspects of many ailments. He knows that the mind can influence the body, and that stress can cause breakdown of normal physiologic functioning. Usually he is aware that drug therapy often merely treats a symptom and that the basic causes of the condition are untouched. But if all patients with psychosomatic complaints were to be referred for psychotherapy, only a small percentage could obtain treatment. There are too few psychiatrists, analysts and clinical psychologists. There are not even enough of them to take care of the psychotics in our population in a proper way, let alone the millions of neurotics and tens of millions of psychosomatic cases who need therapy. The only answer to this situation is for other medical specialists and, particularly, for general practitioners to learn the basic principles of psychotherapy and to apply techniques which are simple yet effective. Hypnosis, in many situations, provides the answer, for it can produce quick results, although it is by no means infallible.

The general practitioner or specialist does not have to become a trained psychotherapist in order successfully to treat many psychosomatic conditions. Certainly he should have some basic knowledge of the principles of psychotherapy and of unconscious behavior and motivations. The situation is somewhat similar to surgery. Most physicians are prepared to perform minor surgery but, if the condition is a serious or complicated one, a surgical specialist is called in. Many neurotic illnesses require the services of a trained psychotherapist. Others, particularly psychosomatic illnesses, may be handled rather superficially, but with success. The general principles involved in psychotherapy can be learned readily by anyone who has had medical training.

Suggestion

Until the time of Freud, the only method of dealing with functional disorders was through suggestion, either with or without hypnosis—much more effectively if hypnosis was used. Old-time medical hypnotists did not confine their treatment by suggestion to functional ailments. It was sometimes successful in treating some organic complaints. Suggestion, though regarded by most physicians with suspicion, actually is used continually by them, often unintentionally and without awareness. And also unintentionally it can be very detrimental, for it is a force which works either positively or negatively. The office atmosphere, the "bedside manner," gestures, speech inflection and tone of voice, the reassurance which any sympathetic and skillful physician utilizes—all are suggestion and essentially are hypnotic techniques. A Cadillac is a suggestion of a busy practice and prestige.

Suggestive treatment is only one way in which hypnosis may be utilized. Analytic techniques are best. But suggestion is potent and can be of great value. Such treatment has been scorned by most analysts and psychiatrists, but unwarrantedly and through lack of knowledge of how it can best be used. It has been stated that its results will be only temporary and that there is danger of a worse symptom forming if one is suppressed by suggestion. These criticisms have some merit, but are greatly exaggerated. Suggestion, properly handled, can bring excellent results without danger of new symptoms arising. This is accomplished merely by making suggestion permissive rather than commanding or dominative. If the patient has an unconscious need for the symptom it will persist and no harm is done. But often the symptom can be eliminated readily. Suggestion has its place in psychotherapy.

Application of Hypnosis

Until hypnotic techniques were applied to analytic methods, hypnotherapy was largely a matter of suggesting to the patient that he would be well—that his symptoms would disappear. But modern usage is to employ various hypnotic techniques and phenomena to uncover the causes for neurotic behavior, or illness which is due to psychologic and emotional causes. Usually these can be learned in a very short time. In many cases they may be rather superficial. And then, a thorough knowledge of psychotherapy is unnecessary. To enable the patient to function ade-

quately and to eliminate a symptom, deep analysis may not be required. In conditions where there is considerable mental disturbance, depression, or where the causes cannot readily be brought out because of repression, referral to a skilled psychotherapist is, of course, indicated.

Not many physicians refer such ailments as dysmenorrhea and other menstrual disorders; migraine; allergy; respiratory conditions such as asthma, emphysema or bronchiecstasis; internal diseases such as duodenal ulcer, gall bladder disease, colitis, or chronic constipation. The list could be extended to cover the majority of psychosomatic illness. Yet more than drugs and medication is needed in such conditions. Hypnosis with brief psychotherapy can be the key to their treatment.

Limits

Hypnosis is in no way a panacea. It has its limitations. It is merely a tool and not a method. Sometimes its overenthusiastic practitioners oversell it in discussions or lectures. Its techniques can be adapted, however, to any school or form of psychotherapy, from mere reassurance to orthodox psychoanalysis. Learning to apply hypnosis clinically will include to some extent learning the rudiments of psychotherapy—no difficult or lengthy task.

Most of us are aware that there are various levels of the mind, though our knowledge of the unconscious is still, most unfortunately, very scanty. Though vitally needed, research in this field is minimal.

Safeguards

Not many know that the unconscious part of the mind thinks and reasons, though in a manner somewhat different from that employed by the conscious part. This can be demonstrated readily through automatic writing, where a person's hand may write lucid, connected material without conscious knowledge of what is being written. A variation of this is to set up a code of communication with the unconscious mind by means of signals—through a form of ideomotor activity. This may be of the utmost value in medical practice in psychotherapy as an uncovering device and even as a diagnostic tool. Cheek has described this technique in this journal[12] as I have elsewhere.[13] It consists of asking questions worded so they can be answered "yes" or "no," with ideomotor responses made through unconscious movements by the patient.

This questioning technique may be carried out either in the waking state or under hypnosis. It even provides a safeguard for the physician lacking a thorough knowledge of psychotherapy who might find himself in difficulties with a patient by perhaps getting into water over his head. Sometimes symptoms result from traumatic events too overwhelming to be faced by the patient. In approaching any past trauma or conflict, the unconscious mind may be asked if it is safe to bring the matter to consciousness. If the answer, by these movements, is "no," undoubtedly the case should be referred to a psychotherapist. If "yes," the physician can rest assured he is on safe ground.

It is well recognized in psychology that the unconscious mind is in control of all autonomic functions of the body and probably of the entire body mechanisms. Often this can be demonstrated through hypnotic suggestion. And through hypnosis this control may be utilized by the physician.

Conversion

A situation continually encountered by physicians, but seldom realized, is what has been termed organ language. This involves the conversion of an idea into a physical symptom. We often remark about some unpleasant idea or situation—"That is a headache to me;" "It's a pain in the neck;" "That makes me sick (or sick at my stomach);" "I can't swallow that" (globus hystericus). There are many similar phrases and not infrequently these ideas are converted into the actual physical condition. Headaches, nausea, neck and shoulder tension and pain are often the result. Such things can usually be corrected by very superficial psychotherapy—mere insight into the mechanism involved. And when insight has been gained, permissive hypnotic suggestion can then be valuable in treatment.

Still other hypnotic uncovering techniques are available. Some require a more thorough knowledge of psychotherapy. Dreams can be produced by suggestion either during the hypnosis, or later during the night. In hypnosis a patient often is able to understand the meaning of dream symbols and to interpret his dreams. The analyst must wait for his patient to dream. With hypnosis the patient can be told when to dream, and even what to dream about. Dream symbols can be pre-determined. The same dream can be repeated in different form for easier interpretation.

Uncovering Devices

Projective techniques involve having the patient see scenes of therapeutic importance on an hallucinated TV set or a motion picture screen. Or he may be led to hallucinate handwriting on a blackboard, or actual automatic writing can be elicitated, with much valuable information learned which the patient does not consciously know.

The orthodox technique of the psychoanalyst, free association, is much freer under hypnosis and may be valuable, although there are much quicker uncovering devices.

One of the most valuable hypnotic tools is age regression. The subject is told to return to some particular time or event and then he relives it, with much emotion in the case of psychic trauma. This is the most effective means of causing abreaction and carthasis.

Better Understanding

If physicians, and also the general public, had a better realization of what hypnosis really is, objections to it would vanish quickly. Various misconceptions are prevalent. For instance, almost everyone believes that, when hypnotized, he will lose consciousness as in sleep or with an anesthetic drug. Actually there is never loss of consciousness even in the deepest stages of trance. The subject is always fully aware. Nor is he "in the power of the hypnotist." A subject cannot be caused to do anything he would not do when awake—suggestions are unconsciously censored. And no one can even be hypnotized unless perfectly willing. What appears to be an exception in the latter case is that it is quite possible to hypnotize a person without his being aware of it. In such case, willingness may not be recognized consciously but must exist at the subconscious level.

Actually, there are many spontaneous hypnotic states into which we frequently slip, probably many times each day. But they are unrecognized as such. When one day-dreams it is nothing but spontaneous auto-hypnosis. It may be only a light state, or it may be deep. When reading a book, sometimes the reader will become so concentrated and interested that he slips into hypnosis and, if spoken to, may not hear. "Highway hypnosis" is a common experience—falling into a trance due to the very monotonous hum of the motor and fixation of vision on the white line of the road, which are matters conducive to hypnosis. Most people have had the experience of suddenly realizing they have passed through some town with no memory of having done so—an amnesia for it. Sometimes accidents result from such a trance state. These spontaneous states are not termed hypnosis, but that is exactly what they are. If people realized how commonplace hypnosis is, much fear of it and the misconceptions regarding it would be eliminated. Williams[14] has described and discussed these spontaneous trances.

Training Needed

As yet very few medical schools or universities offer instruction in hypnotic techniques. Dental schools are evincing interest and several, including the University of Oregon School of Dentistry, have offered extension courses in "hypnodontics." Invariably they are then repeated because of the excellent attendance and interest shown by dentists. It has been difficult for the physician to find adequate instruction. However, symposiums are being held in various cities throughout the country and attendance at these courses averages around one hundred. Many physicians have thus been able to learn the use of hypnosis clinically. These are basic courses and adequately prepare for use in practice, though further reading is recommended to give a more thorough knowledge of both hypnosis and psychotherapy.•

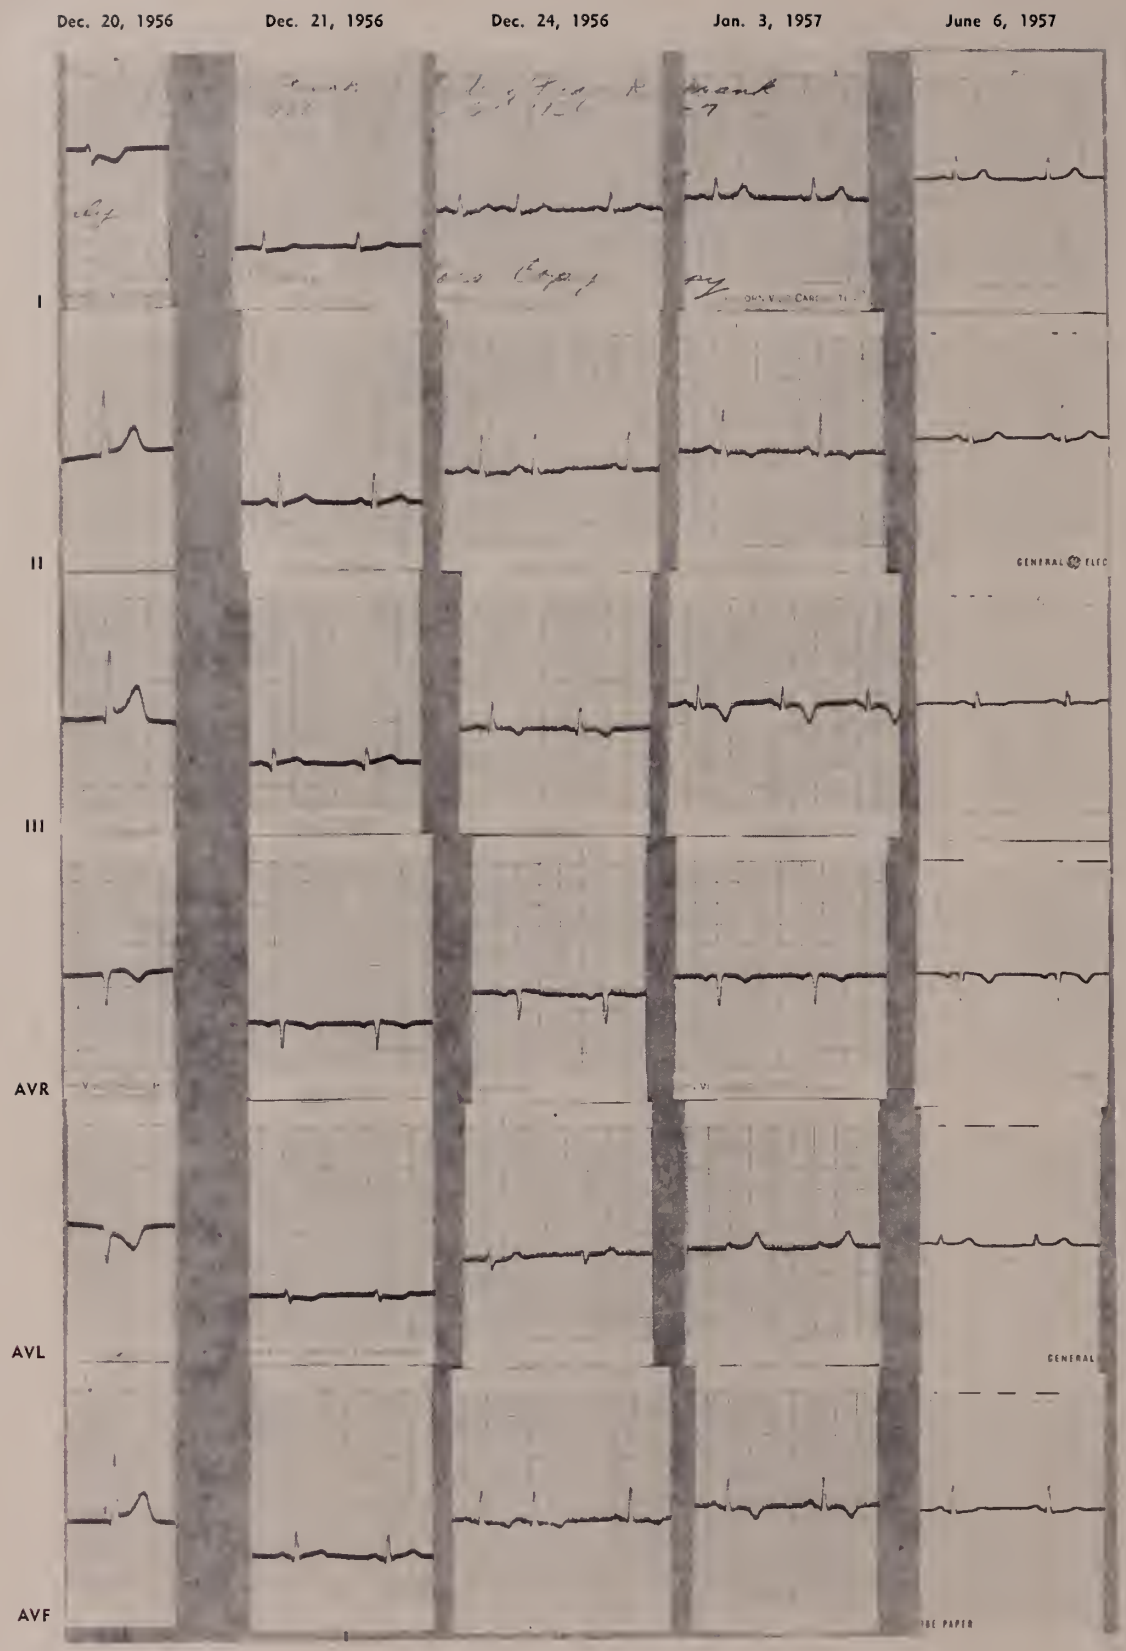
Painless Myocardial Infarction

Peter Fisher, M.D.
SEATTLE, WASHINGTON

A case of painless myocardial infarction of such severity as to require maintenance with levarterenol bitartrate for three days to keep patient out of shock is presented. Casual polling of fellow practitioners, including two cardiologists, indicated that, although all were aware of the occurrence of painless myocardial infarction, most of them either were uncertain that they had ever seen an acute case that fulfilled all the reasonable criteria or had seen very few. Subsequent review of the literature revealed the startling fact that estimates of incidence of painless myocardial infarction varied from very common to extremely rare. This paper will attempt to clarify this question. The case herein presented appears to be one of the very few detailed case reports in the literature that represents true, certain, painless myocardial infarction.

CASE REPORT



This 63 year old white male had been in apparently perfect health. He never had had an operation, serious illness nor had recently felt ill in any way until 1:30 P.M., December 20, 1956, when quite suddenly, and without warning, he had malaise, pernicious vomiting and fecal incontinence consisting of a large amount of soft, brown non-bloody stool. Following this, he lay down feeling very weak and looking very pale but had no recurrence of vomiting or defecation. He was first seen at 3:00 P.M., only at insistence of his colleagues, because he looked so pale and still felt weak. He vigorously denied then and repeatedly for days of questioning thereafter having any pain, pressure sensation, discomfort or any sensation that could conceivably be interpreted as an ache, pain or pressure. He apparently had a normal pain threshhold in that he had had during his life minor injuries, some headaches and various other common symptoms and felt that his appreciation of pain was about that of others. Prior to onset of symptoms there was no unusual activity or diet, except a party on the day of illness where he had had some snacks and did a little more cocktail drinking than was usual for him.

On initial examination at 3:00 P.M., the patient was alert and cooperative and remained this way throughout his course. He had extreme pallor. The heart beat could not be heard by stethoscope nor the pulse felt. A systolic blood pressure could barely be heard at 60.

A tentative diagnosis of painless myocardial infarction was made. The patient was hospitalized immediately. Within the half hour, oxygen was administered. Dextran was given because of the possibility of surgical shock from inapparent internal blood loss, and intravenous infusion of levarterenol bitartrate was begun. Within 30 minutes, blood pressure stabilized at 110/70, having previously taken a swing to 150 from excess levarterenol bitartrate which also caused muscle irritability and spasm. An electrocardiogram, taken while the patient was still in shock, within 15 minutes of hospital admission (Fig. 1), showed changes compatible with posterior wall damage and what appeared to be an A V nodal rhythm.

By 7:00 P.M. on the evening of admission, levarterenol bitartrate was discontinued. Shortly thereafter, perspiration and nausea reappeared and the systolic pressure dropped to 60. Levarterenol bitartrate was started and continued through the night. By morning the heart sounds were just barely audible. Pulse was 65 and blood pressure 120/77. Again levarterenol bitartrate was stopped, shock ensued and the intravenous medication was started again. This pattern continued for the next two days, so that he required nearly continuous levarterenol bitartrate infusion for 60 hours. No urine was put out at this time, presumably because of shock, but suggesting the possibility of true renal shutdown. Therefore, baseline electrolyte studies were taken which are noted later. By the following morning, however, some urine was excreted. Output was copious the next day. Anticoagulant therapy was started on the second hospital day and continued effectively through the hospital stay without complication or difficulty. Some left basilar rales and cough occurred on the second day. Penicillin was started because of presumptive diagnosis of bronchitis. Later chest x-ray showed a shadow in this area compatible with atelectasis or pneumonitis. Subsequent films showed clearing. Auricular premature contractions began on the fourth day. They responded to oral procaineamide. Chair rest was begun on the fourth hospital day. The blood pressure remained stable from then on. At no time during this convalescence or during many instances of drop of blood pressure could I get any admission of chest ache, pain, or discomfort of any sort. There had been no lapse of consciousness at any time except in natural sleep and no impairment of sensorium.

Laboratory studies during hospitalization showed a normal hemogram except for a white cell count of 16,500 which returned to normal in a few days. The serum

potassium and sodium, blood urea nitrogen and sugar were normal. Sedimentation rate was 36 mm. on second day (Wintrobe) and 37 on fourteenth day. There was slight fever on second and third days but none thereafter. Serial electrocardiograms (Fig. 1) over the next six months showed classic evolution for acute posterior myocardial infarction. Six months after onset of the infarction, the patient was at his full time executive occupation and felt entirely well. His heart sounds were normal and his blood pressure 120/70.

Criteria for Painless Myocardial Infarction

While the factors of pain sensitivity, definition of pain and care in history-taking are important in selection of proper cases, the following specific criteria must be met to qualify the patient as having had painless myocardial infarction.

1. The infarction must be acute. This insures no inaccuracy from loss of memory of past attack. Particularly, mild chest aches can easily be forgotten.

2. The infarction must be proved by autopsy or serial electrocardiography.

3. History must be taken with great detail initially and reviewed with the patient during convalescence or again before death.

4. Cases with sudden death must be excluded because history or pain appreciation may not be satisfactory.

5. No chest discomfort may be present that could be represented as pain, pressure, ache, smothering, or deviation from normal.

6. Marked dyspnea must be absent, for pain may not be appreciated during the anxieties and labors of air hunger or difficult respiration.[1]

7. The patient must be conscious at all times except for natural sleep. This excludes patients under anesthesia or who have fainted any time during the initial hours of the attack.

8. The patient must have clear sensorium at all times and be questioned about the presence or absence of discomfort repeatedly and forcefully during the first few hours of the infarction.

9. It is desirable that the patient has not experienced painful infarction previously or angina pectoris. Progressive narrowing of the coronary arteries causing myocardial ischemia and fibrosis could also cause loss of pain sensitivity in future infarction of these areas.[2]

Review of Literature

Kennedy[3] reviewed 200 autopsied cases from the Peter Bent Brigham Hospital from 1913 through 1936. After suitable exclusions, there were 142 cases of acute infarction for evaluation. Of these, only 4 per cent were considered painless. Of these, only 4 showed a reliable history by record review and of these four, one died after gasping for air and denying pain, while another had long history of angina and was semistuporous during his attack, being aroused with difficulty. He died two weeks later. Another had reliable story of marked dyspnea and died in six days, and another died almost immediately after marked respiratory difficulty. Thus, only one autopsied case every five years was considered to be possibly painless, and three of these four were at least very uncertain.

Stroud[4] reported on 49 cases of silent atypical occlusion with and without infarction and believed 13 of them were without pain. This report does not contain sufficient detail to evaluate.

Babey[5] studied the records of 116 patients admitted to King County Hospital at Seattle with myocardial infarctions in 1938. Only one case seemed to be without pain, and this patient had had a painful infarction three years previously. Babey concluded that it was a very rare occurrence.

Warner[6] reviewed 200 consecutive cases of recent infarction admitted to a Veterans Hospital from 1947 through 1950. Seven, or 3.5 per cent had no pain. Of these, one was in coma, one was moribund, one was under anesthesia, three were aphonic and one was in shock. They considered therefore that they had no certain cases of painless infarction.

Roseman[7] made a full review of the literature to 1954, pointing out that up to the year 1937, estimates for occurrence were from 4 to 61 per cent, but since then, with more careful scrutiny, the incidence seemed very rare. He reviewed the records of 220 cases seen at the Boston City Hospital. Ten, or 4.5 per cent, were presumably without pain, but only 5, or 2.3 per cent, had reliable histories. Of these, 4 had dyspnea with the attack, leaving perhaps one true case—or 1 in 220. He considered the incidence very low.

Discussion

Previous reports on painless myocardial infarction have many possibilities for error—perhaps the greatest being that the data are collected from old records rather than current experience. Random questioning of medical practitioners who handle problems of the heart has shown that there appears to be little certainty

of the frequency of painless myocardial infarction. Everyone seems to think others are seeing cases but no one seems to be seeing cases firsthand. Analysis of many of the available case reports in the literature shows that there are few, if any, detailed reports available. The case herein reported fits all the basic criteria for painless myocardial infarction. Since the diagnosis was made tentatively at onset and established within hours, the history seems unusually reliable.

Conclusion and Summary

1. Painless myocardial infarction is, after all, a very rare phenomenon.

2. An unusual, classic and seemingly entirely reliable case is reported. One unusual aspect of this case was the requirement of levartenerol bitartrate for three days after onset of attack before blood pressure was spontaneously maintained near normal.•

Some New Regulations for Physicians with Medicare Patients

Office for Dependents Medical Care has some new and clarifying regulations dealing with medicare patients and ancillary medical personnel. They are:

Hospital accommodations—Dependents are eligible for semi-private accommodations (two or more beds) and pediatric cases may be handled in wards. For private accommodations, the following should be kept in mind: (1) when this arrangement is believed necessary by the doctor, the patient pays 25 per cent of the difference between the private room fee and the weighted average of semi-private, (2) when the patient or sponsor only insists on private room, the patient pays the full difference, and (3) when the hospital has only private rooms, the medicare patient pays 10 per cent of the daily charge for the room, or the total daily hospital charge, less $15, whichever is the greater.

Independent ancillary personnel—Nurse anesthetists and physical therapists who work on an independent basis can now be paid direct if (1) the attending physician certifies on form DA-1863 that the services were authorized by him and (2) the amount charged does not exceed the normal charge to the public having an annual income of $4,500.

Maternity case fees—If pregnancy terminates in premature delivery, the doctor is entitled to full fee if he has rendered continuous antepartum care beginning in the first 8 weeks of pregnancy. Should a maternity patient consult a physician in a locality away from that of her attending doctor or clinic, the doctor consulted is entitled to fee for a home or office visit.

Diseases That May Not Exist

Morton E. Levitan, M.D.
Kettle Falls, Washington

There are certain diagnoses, existence of which I have come to question. The labels that are attached to these clinical conditions just do not seem correct, or may be unjustified, or, in the final analysis, are not in the best interest of the patient. At least, they are conditions that are here presented in a different light. The six conditions which I shall discuss and seek to disembowel are vaginitis, trenchmouth, tonsillitis, hypertension, pneumonia, and certain forms of neurosis.

Vaginitis

One of the most galling examples is vaginitis. This condition is called an inflammation, and the cause is assumed to be infectious. Monilial and trichomonad organisms, found in the vaginal secretions, are declared the guilty parties. We compare vaginitis to more specific venereal infections—e.g., gonococcal—though we give monilial a certain respectability and do not connect it with extra-conjugal misbehavior. Emphasis is placed on resistance of the organism, even to long-drawn-out treatment, and possibility of reinfection by the husband. He is referred to a urologist and advised to use condoms. Now it is odd that this condition is rarely seen in the woman who is dirty, promiscuous or ignorant. In other words, we do not see it in the type in whom we would expect to find the highest incidence of infection. On the contrary, it prefers the prim, lordotic young woman, very neat, very virtuous, quite tense, and very meticulous in her personal hygiene. At first I wondered whether the inflammation, the irritation, and the discharge could result from too much unnecessary douches, but this is not the answer.

Let us consider the possibility that this is a condition in a tense woman that is comparable to atopic dermatitis. The nervous tension could be the cause of the increase in vaginal secretions, or the preoccupation with same. The inflammatory changes of the vaginal epithelium could be akin to those in eczema, and the monilia and trichomonas may be only saprophytes that flourish in this secretion. That would explain why cortisone suppositories relieve the itching and the irritation, although hydrocortisone supposedly has no effect on the monilia. How neatly this diagnosis requiring prolonged treatment and frequent visits replaces the colitis of Dr. Axel Munthe!

Trenchmouth

Next on the stand—trenchmouth. This is a dismal diagnosis, but one loved by Dr. "Alarmist." Two germs which may be saprophytic in healthy mouths are incriminated, and C-avitaminosis is thrown in for good measure. If there are a few small lesions, it is called canker sores. If they are larger, more numerous, and more troublesome, well then it is trenchmouth. Thus the diagnosis is one of quantity and not of quality. The term probably includes a number of separate conditions which are not well understood.

Tonsillitis

The advisability of tonsillectomy is the subject of periodic articles. I will try not to make this a rehash of the controversies that flare up at frequent intervals. As year after year goes by without my recommending to a single patient that the tonsils be removed, I cannot help wondering whether it is ever necessary. I have watched patients whom I advised against having the operation, to see whether I had done the right thing or not, and have not had to change my mind in a single case. The enlarged tonsils gradually shrank to a respectable size. Irregularly shaped

ones with purulent exudate seemed to clean themselves up, eventually producing a more pleasing cosmetic result for the examining physician's eye.

The acutely inflammed tonsil could be a particular local defensive reaction of the body, rather than an infectious invasion of the lymphoid tissue. The purulent exudate of acute lacunal tonsillitis might be of an entirely different nature from that found in the boil that we blame on staphlococci invading a hair follicle. The tonsils might be compared to the bumpers of an automobile. When the car has a collision, the first part stove-in is the bumper. Yet that is no reason for taking the bumpers off cars. It is possible that the tonsils have a similar function—i.e., to bear the brunt of the infection and produce a defensive reaction in building an immunity to the invading organism.

At one time it seemed to me that lymphatic follicles of the posterior wall were more numerous in patients who had had the tonsils removed. I tried to check this, but saw that often the follicles were just as numerous in some patients who had not had a tonsillectomy. However, in these patients, the tonsil would be small and hard, and probably consist mainly of dense scar tissue and very little functional lymphatic tissue, and be just as inactive as though removed. One recent text even recommended fulgurating these posterior pharyngeal lymphoid follicles. This negates Nature's attempt to have some active lymphatic tissue in the throat, without considering that the lymphoid tissue may be there for good instead of for harm.

To return to the advisability of tonsillectomy, it would seem that the correct thing to do, if doctors disagree on the need for operation and there is no emergency, is to give the patient a little more time and see whether it is really necessary.

Pneumonia

Pneumonia is such a common term, not only in the textbooks but also in common usage, that there is little doubt but that it exists. It does seem a pity that the classic lobar pneumonia should disappear so inconveniently just when the antibiotics came into use. Some claim that the sulfa drugs knocked out the pneumococci. In my practice, there are many patients in sparsely settled regions who have never had any sort of antibiotic. It is doubtful if the pneumococci could have been eliminated in these regions. In 1938 William N. McCartney wrote, "I have maintained stoutly since 1911 that pneumonia is not a disease at all. Not a disease but a morbid condition attendant on other affections and infections, a consolidation of lung tissue occurring as a complication in a large variety of infections, diseases and injuries." Could he be right, and the authors of the learned treatises all wrong and merely repeating an error some author started years ago?

The diagnosis of virus pneumonia is a convenient label for any lower respiratory infection. I have wondered whether it could be essentially a catarrh of the lower respiratory passages, some sort of chain reaction of the lining mucosa. It has been my experience that those cases of lower respiratory infection that ran a high fever improved rapidly, and the lungs would clear up in a few days. On the other hand, the disease would want to drag into weeks in those patients who had little or no fever. It would be interesting, assuming my experience was backed by other physicians, to try treating these afebrile cases with killed typhoid germs or other means of producing fever. Antibiotics seem to do a little good in some cases. In others, patients say they cannot see any benefit. Aerosol detergents or wetting agents have been more effective in clearing the lungs in some cases.

Hypertension

Hypertension as a primary disease is very rare, much rarer than the drug ads would have us believe. I think I have seen less than one case per year. The usual case of elevated blood pressure is due to nerves or obesity. If obesity is the cause of the elevation, weight reduction will not only bring the blood pressure down, but will make the patient feel much better. If the cause is emotional, the elevation is temporary and probably at its peak at the time the doctor takes the pressure. Starting the patient on blood pressure medicine might fix the condition, or the fear of it. Here is a good example:

A young woman who consulted me had a systolic pressure of 230 mm. She told me she was worried about cancer. I did a careful physical examination and told her I found nothing even to suggest cancer. After talking to her a little, I took her blood pressure again, and this time it was 180, that is, a drop of 50 points in less than one hour. Three days later she was in my office again, this time just accompanying her husband.

I took her blood pressure, and this time it was 130, a drop of 100 mm. without a single pill. If I had started her on medicine, that would have been given credit for the decrease, and she would have felt dependent on it from then on.

Of course, the main reason people are worried about high blood pressure is that they are afraid it will bring on a stroke. This fear may be founded on more tenuous ground than is generally assumed. I believe that it is the stroke that produces an elevation of blood pressure more often than the other way around. Hemorrhage in the brain is a space-occupying cerebral lesion that elevates the blood pressure. The stroke may be due to a corroded blood vessel breaking open, but as the physician may be called to examine the patient for the first time immediately after the stroke, he assumes that this very recent elevation of the blood pressure is the cause of the stroke. Thus blood pressure measurement is a scientific advance that may have done our patients more harm than good. We hang a sword of Damocles over their heads and force them to seek medical care for a condition that our instrument determines.

I have noticed that hypertensives and some cardiacs do much better after losing a large amount of blood, as by a severe nosebleed. I wish I had the conviction and independence enough to do a real blood-letting where I felt it indicated. The bloodless phlebotomies with blood pressure cuffs on the extremities are a pusillanimous and not a bold and really helpful measure.

Neurosis

This brings us to psychiatry. We usually assume that the neurotic is handicapped in adapting himself to life situations. This may be so, but it is possible that the world situation should come in for its share of the blame. It is not only flattering to the patient, but it bolsters his confidence in himself to tell him that it is not so much he that is at fault as this crazy world we live in. He will feel less inferior and inadequate if he is shown how easily he might have gotten along in the world as it existed a hundred, or a few hundred, or a few thousand years ago. It also happens sometimes, after I am all through explaining the mechanism of functional symptoms to a patient, apparently to his satisfaction, that he may ask me once again before leaving the office, "Now what is it that you said is wrong with me?" I usually assume that the patient wants to know what to tell his wife, and does not realize that I do not want to put any label on his difficulty nor call him a neurotic. I tell him that there is no reason for making a definite pathologic diagnosis. I would rather that he say with Popeye, "I yam wot I yam, and that's all I yam." He is just another human being with his good points and his shortcomings, either of which can sometimes be a trial.

I have seen several women lately presenting almost identical psychologic pictures. They seem quite composed when they come in, and may broach the interview by asking me whether they are starting through the change. This has occurred to them because, of late, they have become quite emotional and liable to break out in tears without any reason. One woman, in describing how tense and irritable she has become, told me that she was afraid to have her husband say good morning to her, lest she snap and bite his head off, or start crying. They are usually good women of hard-working, respectable, and fairly well-to-do middle class homes. There are no menstrual irregularities or hot flashes, and the only symptom on a hormonal basis may be premenstrual tension. I know the families well enough to be sure that there are no skeletons in the personal or family closet. In these cases, I do not think a psychiatrist could add much to what I know of these depressions and emotional instabilities. I am definite in stating that it is not the menopause.

Going on from there, we look for other possible causes. But everything is going well. Business is good. The husband is not the kind to play around. Finally I have been considering whether it is possible that things are going too good. That is the only explanation that I have to offer. There are no difficulties to overcome, no challenges, no tasks to give some solid satisfaction. Even the little tasks that used to give a woman some pride have been eliminated. Instead of baking her own bread, it is so much easier just to buy a sliced loaf in the local supermarket. Getting clothes is now just a question of picking them out and charging them. A continually sunny clime is not always in tune with human nature. Peace may be wonderful, but war does have an exhilarating effect on the population. Suicide rates drop sharply. Does the number of depressives drop likewise?

Gorky, in his short story, Orloff and His Wife, tells of a couple that live a brutish humdrum

existence, without show of love between them, without happiness, accentuated only by his frequent drinking bouts when he beats her. Then an epidemic hits the community and they are both absorbed and happy in helping the stricken. Once the epidemic is over, they revert to their previous monotonous, brutish existence. Poor human beings, that it should require a calamity to bring them happiness.

We ridicule the soap operas with their unending train of woe and tribulations. Could they be the vicarious substitute for the misfortunes lacking in a woman's unexciting existence? We go to see tear-jerking plays, come out furtively wiping our eyes and say that the play was really good and we really enjoyed ourselves.

I will admit to the patient that it seems ridiculous to think that the trouble may be that things are going too well. I can only say that I have wondered about it. Sometimes they take over from there and tell me that when their child was sick, and they stayed up all night with him while he was delirious with fever, the depression and tearful misery did not bother. I point out that if it were the menopause, the added worry would aggravate the condition. At least this explanation does help. They know what they have to contend with, understand why I give them sedatives, and use them more judiciously.

Conclusion

It may seem surprising that a general practitioner should question the opinions of specialists. The general practitioner does not see the concentration of cases that the specialist does, and does not have the specialist's elaborate technical facilities. But the general practitioner has a different medical philosophy, and maybe, because he sees fewer trees, he is better able to see the forest. Hence, certain medical conditions may present a different picture to him. •

Rehabilitation Group Studies Various Programs

The American Medical Association's Intra-Association Committee on Rehabilitation has, for some time, been reviewing and studying the rehabilitation programs of various federal and private national agencies.

Through conferences and collection of pertinent material, the committee hopes to prepare guides for medical societies for developing sound rehabilitation services and facilities at the local level.

Frank H. Krusen of the Mayo Clinic is chairman of the intra-association committee. Other members are O. A. Sander, Milwaukee, from the Council on Industrial Health; Walter H. Baer, Peoria, Ill., from the Council on Mental Health; Guy A. Caldwell, New Orleans, from the Council on Medical Education and Hospitals, and Hoyt Woolley, Idaho Falls, Idaho, from the Council on Medical Service.

Briefly, the committee's objectives are to coordinate rehabilitation interests and activities within the AMA, foster medical supervision of rehabilitation services and centers, study the problems and inter-relationships of the medical, social, educational, and vocational aspects of rehabilitation, and keep the medical profession abreast of new and pertinent information regarding rehabilitation.

The committee held a meeting in Washington recently and invited representatives from the Office of Vocational Rehabilitation of the U.S. Department of Health, Education and Welfare, the Division of Physical Medicine and Rehabilitation of the Veterans Administration, the President's Committee for the Employment of the Physically Handicapped, and the Council on Rehabilitation of the Medical Society of the District of Columbia, as well as representatives from five county medical societies in the surrounding area.

Previously the committee had met with representatives from the American Academy of General Practice and the American Heart Association.

The committee is presently organizing an educational program to acquaint physicians with the value, need, and importance of rehabilitation services.

Glaucoma Case Finding

Earl L. Barrett, M.D.
SEATTLE, WASHINGTON

Screening for glaucoma by means of tonometry should be an integral part of a complete routine physical examination for individuals over 34 years of age. Seven years experience in my office has shown a 2+ per cent incidence of uncomplicated glaucoma. Surveys at the University of Oregon and Yale University Medical Schools have shown the same incidence.

Tuberculosis and diabetes mellitus routine case screening have become well established in spite of their relative rarity—glaucoma screening can be done less expensively, more quickly and is much more productive.

Glaucoma is not a specific disease but a term used to describe an assortment of various intraocular conditions with the common factor of abnormally elevated intraocular pressure. This increased pressure results in degeneration of the visual elements with resultant blindness—at first an insidious peripheral field loss and terminally central blindness.

It is not the purpose of this paper to differentiate the sub types, but to deal with the main factor (intraocular pressure) and its detection in the uncomplicated type of glaucoma.

Symptoms

Twenty-five per cent of glaucoma can be suspected from a history of recurrent mild headaches and blurred vision. This type occasionally has rare episodes of an acutely congestive phase. Dramatic findings and symptoms are then present—i.e., a red, painful eye with edematous conjunctiva, a relatively large pupil and decreased vision. It is usually associated with nausea and vomiting. This is easily misdiagnosed in children as meningitis or in adults as conjunctivitis with an abdominal disorder.

In 70 per cent of cases, glaumoca is a symptomless disorder. The onset is insidious and the patient invariably notices nothing wrong until the disorder is well advanced and central vision has begun to fail. Only exceptionally does he complain of mild pain, haloes, fogginess or any symptoms common to the rare acute congestive episodes of the less common type.

Face-to-face visual fields, in which the examiner compares his field to that of the patient, are normal until the field damage is so extensive that the patient has difficulty walking through doorways. Ophthalmoscopic examination for optic nerve head atrophy is of no value as an early finding. Glaucomatous cupping is in reality optic nerve head atrophy and, therefore, is a late finding. Testing intraocular pressure with one's finger is valueless as an aid in detection of early cases.

Acute episodes of very high tension will produce findings and symptoms in the less common type, but only very rarely do symptom-producing episodes occur in the more common type. These rare episodes are often precipitated by systemically administered drugs or by emotional crises. Systemic or local steroid therapy at this time will mask the symptoms and findings so as to obliterate the chance for a diagnosis without tonometry.

Measurement of Intraocular Tension

The best way to establish the diagnosis of glaucoma early enough to prevent severe visual field loss is by measure of the intraocular tension. (True intraocular pressure is not measured by a tonometer because this ignores the factor of ocular rigidity.) However, the clinically used method of measuring the intraocular pressure with a tonometer is satisfactory for diagnosing glaucoma. Finger pressure testing is not sufficiently accurate for screening purposes.

The early detection of patients with glaucoma can and should be done in the offices of general practitioners and internists. All ophthalmologists routinely check the tension of persons over 35

years of age. However, not everyone is able to consult an ophthalmologist.

The intraocular tension can be satisfactorily measured by means of a domestic Schiotz Tonometer sold for between $50 to $70 by most surgical supply companies. It is possible to obtain a satisfactory imported instrument for $25. A Tolman indicator can be obtained for $12 from the Ophthalmological Foundation, Inc., 111 E. 59th St., New York 22, N. Y., or from any surgical supply house.

Conclusion

General practitioners and internists should include glaucoma screening in their complete workup. Cases will then be detected early and needless loss of peripheral vision will be avoided.

I urge these doctors to equip themselves mentally to screen for glaucoma, to obtain the necessary equipment and become familiar with its operation. The need for screening of the entire adult population is imperative. Whatever aid is necessary for this procedure can be obtained from the nearest ophthalmologist or through the secretary of the Eye, Ear, Nose & Throat Section of most state medical associations. •

AMA Presents New Radio Health Series

To give your community a monthly report on the newest and best in medicine, the American Medical Association introduces its new radio transcription series—"Health Magazine of the Air." Based on current items from *Today's Health* magazine, the new 15-minute series features Mr. H. V. Kaltenborn, veteran newscaster and radio-TV commentator, and W. W. Bauer, M.D., AMA's Bureau of Health Education director. The programs are produced by the Marshall Organization, Inc. under the direction of the Bureau.

Seasonal health spot announcements—three 15-seconds; three 30-seconds, and two one-minutes—will be presented on the reverse side of the platters. These spots will be given by popular movie personalities who contribute their time as a public service. The announcements were presented in February by Peggy Wood of the "I Remember Mama" program.

First shipment of the new transcriptions were made to approximately 400 radio stations throughout the country in February. The platters are to be released about the fifth day of each month from February through December, 1958, for immediate broadcast. Although the present selection of stations has been based on those previously airing AMA radio transcriptions, local medical societies may contact the Bureau of Health Education for further information regarding additional outlets.

Toxaphene-Lindane Poisoning by Cutaneous Absorption

Report of a Case with Recovery

Robert W. Pollock, M.D.
BAKER, OREGON

In the medical literature, there are no instances recorded of poisoning in the human by cutaneous absorption of Toxaphene-Lindane with symptoms which could be attributed to pharmacologic action of the material.

Toxaphene is a chlorinated camphene which is used as an insecticide. Lindane is a benzene hexachloride which is also used as an insecticide. Toxaphene-Lindane is used as an insecticide to kill larvae of mosquitoes, flies, and roaches. The minimum lethal dose of Toxaphene is 3 Gm. and of Lindane 15 Gm.

The lethal mixture of Toxaphene-Lindane can be absorbed through all portals, including the skin. Symptoms of the two drugs are practically identical. Usual sequence of events after ingestion are central nervous system stimulation, high temperature, convulsions, gastric irritation, vomiting, diarrhea, respiratory failure, and death.

In the identification of the two drugs there are no tests available which can be performed in a clinical laboratory.

Evidence in the following case points directly to Toxaphene-Lindane as having been the causative factor. It also reemphasizes the great value of a thorough history in arriving at a working diagnosis.

REPORT OF CASE

On April 22, 1957, I was called to attend a white, male farmer, 70 years of age. He was unable to give a history because he was semi-conscious, disoriented, and stuporous. The wife stated that at approximately 3 A.M. of the preceding day he suddenly developed a generalized headache with fever, marked lassitude, and poor coordination. Nausea was severe, and he vomited many times. He complained of severe epigastric pain, severe generalized muscular aches and pains, particularly of the extremities. The nausea and vomiting were severe during the first 12 hours, but gradually decreased in severity after 48 hours. There were no convulsions. The possibility of accidental poisoning was discussed with the wife. She could not recall anything of significance, except that the family had eaten home canned beans the evening before. As no other member of the family was ill, the possibility of botulism was discarded.

The only thing of any consequence in his past history was that he had had Rocky Mountain Spotted Fever in 1947. He had been treated occasionally during the past 20 years for auricular fibrillation and hypertensive heart disease. Another point of interest was that he had been bitten many times by mosquitoes during the previous two weeks.

The patient was treated at home for nine days. He was stuporous, apathetic, and exhibited a very dull sensorium. He refused to be hospitalized. On being questioned, he would attempt to answer, yawn, and then drift into a half wake, half sleep condition.

During the first week, he did not exhibit any neurologic signs except dulled sensorium. He complained constantly of epigastric pain and muscular aches and pains. The musculature was flaccid. The patient ingested fluids but vomited many times. Temperature ranged from 101 F. to normal. He also complained of his skin itching, but no rash was noted. He was given penicillin and Chloromycetin, plus digitalis for auricular fibrillation.

The only positive physical findings, until the sixth day of treatment, were the variation in temperature, auricular fibrillation, blood pressure 185/100, and dulled sensorium. There was tenderness to palpation in the epigastric area. Reflexes were weak and muscle tone was poor.

On the seventh day of treatment, he developed a stiff neck. Despite this development, he refused hospitalization. He became semicomatose on May 1, 1957, on which date he was hospitalized. He was very dehydrated.

Treatment was supportive only. Balanced electrolyte soultions were used to restore hydration.

The patient complained of diplopia and he had difficulty in swallowing. Reflexes were weak and muscle tone was poor. Retinal arteries were sclerotic. There was papilledema and there were paralysis of the right third, both fourth and the left sixth cranial nerves. The

Read before the Baker County Medical Society September 9, 1957.

neck was stiff. Pulse was irregular and arrhythmic; blood pressure was 200/100; a to-and-fro murmur was heard over the whole precordium. There was tenderness in the epigastrium.

On the fourth hospital day he developed a right Babinski and the next day it was bilateral. The neck was still stiff. He was still semi-stuporous and disoriented. Left third nerve and both fourth nerves were paralyzed. X-rays of the skull were negative.

Complement fixation for rickettsiae and stool cultures for equine encephalitis were reported negative by the United States Public Health Service Laboratory at Hamilton, Montana. Blood counts revealed no abnormality. Urine albumin was recorded as 3 plus. Urea nitrogen was 45.

Spinal fluid pressure was increased; the fluid was xanthochromic; protein, sugar and chlorides were normal. No organisms were seen on stained smears. On May 5 the fluid had returned to normal.

Diagnostic possibilities considered were: western equine encephalitis, rickettsial disease with central nervous system manifestation, intracranial neoplasm, brain abscess, chronic subdural hematoma, cerebrovascular disease and encephalitis lethargica. The diffuse infection of the brain called encephalitis lethargica seemed the best diagnostic possibility because of the acute type of onset, with typical fever, oculomotor paralysis, insomnia, diplopia and mild choked disk. Equine encephalitis was ruled out because no cases had been reported in horses in this community.

The patient improved slowly. First sign to clear completely was the oculomotor paralysis. The Babinskis then disappeared and he recovered binocular vision. Papilledema was the last to be eliminated.

Nausea, vomiting and epigastric distress stopped on the tenth day and the dullness of sensorium was replaced by normal reactions. Gait was ataxic at first and there was temporary difficulty in walking except with assistance. He was discharged from the hospital May 14, 1957.

On May 20, I called at his home near Richland, Oregon, and reviewed the sequence of events leading up to his illness. On questioning him regarding the use of insecticides, he stated that the day before the onset of his illness he had had prolonged skin contact with a Toxaphene-Lindane solution. Desiring to rid his small band of sheep from wool insects, he had mixed the solution into the wool with his hands. This procedure consumed two hours time. The contaminated skin was not washed with soap and water. Symptoms developed 10 hours later. The final diagnosis of this case is Toxaphene-Lindane poisoning secondary to cutaneous absorption. •

2170 First Street.

Medical Education Week, April 20-26, 1958

During the week of April 20-26, the medical profession will join forces with the Woman's Auxiliary and the medical schools throughout the country in presenting programs emphasizing the progress, problems, and challenges of medical education. The world leadership of American medical schools, their expanding enrollments, research triumphs, and community services are little known by the public at large, and Medical Education Week is designed to create greater public appreciation and support for their continuing achievements. At the same time, it will stress the problems which the foreseeable future holds—increased competition for the qualified school candidate, greater facilities for teaching the growing complexities of medicine, and the need of an expanding and aging population for more doctors. And, not least of all, is the immense cost of medical education which already is a $200 million annual undertaking.

The six specific aims of Medical Education Week are to:

1 — portray the key role that medical education plays in the promotion and maintenance of the nation's health and security, and make the public aware that the nation's 83 medical schools are the foundation of our entire health and medical structure;

2 — explain how the medical schools are striving to meet the demand for larger numbers of physicians and, at the same time, characterize American medical education;

3 — call attention to the steady progress in the medical sciences, showing what this means in terms of longer life, better health and greater freedom from disease and disability;

4 — point out the wide range of activities—teaching, research, service and leadership—carried on by the modern medical school in addition to its job of training new doctors;

5 — make clear the extent and nature of the new challenges to the profession, some growing out of our constantly expanding fund of medical knowledge and some resulting from the mounting complexity of our civilization, and

6 — point out some of the steps being taken constantly to push back the horizons of the medical sciences and to realize the full potential of the nation's health resources.

Post Myocardial Infarction Syndrome

WILLIAM COHEN, M.D.
AND
LEONARD B. ROSE, M.D.
PORTLAND, OREGON

At the 28th scientific session of the American Heart Association in October 1955, Dressler described a post myocardial infarction syndrome characterized by recurrent pain, fever, and pericardial, pleural and pulmonary involvement. He reported 10 cases.[1] In discussing differential diagnosis of non-specific pericarditis and myocardial infarction, McGuire et al. described a case of recurrent pericarditis occurring two and eight weeks respectively after an acute myocardial infarction and which appeared to resemble the syndrome as described by Dressler.[2]

We have observed a patient with many recurrent episodes who seems to fulfill the criteria outlined by Dressler. In order to arouse interest in this syndrome and to stimulate other observers to report similar cases, which we believe to be more numerous than heretofore recorded in the literature, this case is described in detail.

CASE REPORT

First Admission: A married, 44 year old white male, while traveling, was hospitalized in a small community hospital June 2, 1955 because of severe oppressive pericordial pain which radiated to the left shoulder and down the arm to the ulnar aspect of the hand, and which was associated with profound weakness and profuse sweating. An electrocardiogram taken the same day revealed findings suggestive of an acute anterior wall infarction. A repeat electrocardiogram on June 4, 1955, showed a fresh, full thickness, anterior-septal infarction. (See figures 1, 2.)

The patient was seen in consultation June 5, 1955. Further questioning disclosed that for a week prior to the acute episode he had experienced repeated short episodes of pericordial pain radiating to the left shoulder and down the left arm to the ulnar aspect of the wrist. These episodes of pain were brought on by exertion and relieved by rest. Physical examination showed an apprehensive, diaphoretic white male with temperature 100 F., pulse regular at 78 per minute, and blood pressure 98/80. An occasional fine rale was heard in the left base posteriorly and a pericardial friction rub was present. The rest of the examination was negative.

Due to the acute nature of the condition it was considered inadvisable to move the patient. Anticoagulants were not recommended because of inadequate laboratory facilities. On June 18, 1955, the patient, at his own insistance, moved to his home via private automobile, refusing further hospitalization. An electrocardiogram taken at home June 30, 1955, showed changes consistant with an organizing, full thickness, anterio-septal infarct.

On August 11, 1955, the patient appeared at the office and stated that due to economic reasons he had to return to light work. He could not be dissuaded and was advised that he did so at his own risk. His physical condition at that time was good and fluoroscopy disclosed no cardiac or pulmonary abnormalities. Electrocardiogram taken August 19, 1955, (Figs. 1, 2) showed a stabilized, anterior wall infarction.

Second Admission: On September 13, 1955, while attending to his business 300 miles from home, he developed a moderate sticking pain in the upper anterior chest and left shoulder. The pain was aggravated by deep breathing and motion, and was not associated with marked weakness or sweating. However, since the pain persisted for three days, he sought relief from a local physician and arranged transportation home.

On September 16, 1955, he was hospitalized and found to have a temperature of 101 F., pulse 96, and blood pressure 88/60. No additional findings were elicited on physical examination. Blood count revealed hemoglobin 15.2 Gm., red blood count 5.70, white blood count 13,700 with normal differential, and sedimentation rate of 4/21 (Westergren). Urine showed a faint trace of albumin, a rare hyaline cast and 1-2 white blood count hpf. Electrocardiogram (Figs. 1, 2) showed elevation of the ST segments in leads 1,2,3,AVF and V_5 and V_6 with upward concavity. The temperature fell gradually and was normal by September 20, 1955. The sedimentation rate rose to 10/90 on September 19, 1955. The clinical impression at that time was that the patient had developed a new posterior wall subepicardial infarction. He was placed on dicumarol therapy.

At the patient's request he was discharged the following day to continue convalescence at home. Anticoagulants were continued. An electrocardiogram taken September 24, 1955, prior to discharge, showed less elevation of the ST segment from the base line without Q wave or reciprocal ST changes.

Fig. 1. Standard and unipolar limb leads.

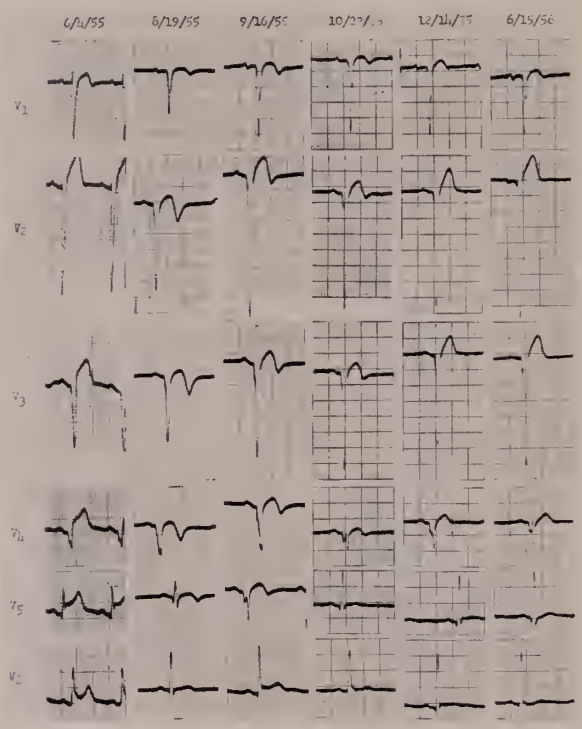

Fig. 2. Precordial leads.

A follow-up electrocardiogram taken October 22, 1955, (Figs. 1, 2) showed that the ST elevation had returned to the base line, and that the electrocardiogram now resembled the tracing taken prior to the second attack.

Third Admission: On December 13, 1955, the patient developed a feeling of oppression in his chest with pain over the upper sternum and left shoulder, similar to the episode of September 13, 1955. He was examined December 14, 1955, at which time his temperature was 98 F., pulse 84 and blood pressure 110/70. The lungs were clear, the heart tones were normal, and there was no evidence of cardiac enlargement or failure. Fluoroscopic examination of the heart and lungs was negative. White blood count was 10,400, and sedimentation rate 6/38. An electrocardiogram (Figs. 1, 2), taken at this time, again showed elevation of the ST segment in leads 2,AVF and V_6, though not to the same degree as present on the electrocardiogram taken on the second admission. The patient remained at home. His temperature reached a maximum of 101 F. on December 16, 1955, and subsided gradually. It was normal by December 23, 1955. On January 6, 1956 the symptoms recurred, this time associated with coughing and dyspnea and aggravated by breathing and motion. He was hospitalized January 7, 1956.

On admission, temperature was 102 F. The patient was moderately dyspneic. Impaired resonance and diminished breath sounds were elicited over the right lower chest anteriorly. The heart tones were normal and the rate was elevated consistent with the elevated temperature. Blood count showed hemoglobin 14.3 Gm., red blood count 5.00, white blood count 14,600, P.M.N. 65, band cells 17, lymphocytes 16 and monocytes 2. Sedimentation rate was 7/50. Urinalysis was negative except for 2-4 WBC/hpf. X-ray of the chest showed a questionable density in the lower portion of the left lung. An electrocardiogram taken January 12, 1956, showed non-specific ST elevation in leads 2, AVF and V_6 somewhat resembling the electrocardiogram of December 14, 1955. The temperature subsided gradually and was normal by January 12, 1956. The sedimentation rate rose to 22/115. He became asymptomatic and was discharged on January 15, 1956 at his request.

Fourth Admission: On February 4, 1956, a follow-up examination including fluoroscopy was not remarkable. There was no evidence of cardiac enlargement. An electrocardiogram showed that the ST elevations were returning to normal. On February 8, 1956, the patient again developed a vague oppressive sensation in the anterior chest with radiation to the left shoulder and down the left arm. It was aggravated by cough, deep inspiration and motion. In addition, diffuse muscle pain was also present.

Temperature on admission was 101 F. Blood picture showed hemoglobin 14.7 Gm., red blood count 5.00, white blood count 12,300, P.M.N. 85, band cells 3, lymphocytes 7, monocytes 5 and sedimentation rate was 15/58. Urinalysis was negative. An electrocardiogram taken shortly after admission showed slight elevation of the ST segment in leads 1 and 2 similar to those seen in the second and third admissions except that in the previous two admissions the ST elevations occurred in leads 2,3, AVF, V_5 and V_6. Prothrombin time on February 15, 1956, was 18.5 per cent and serum transaminase was 13 units. On February 17, 1956, a few fine rales were heard in the posterior basal segment of the left lower lobe and chest x-ray showed a small area of patchy infiltration in the left base as well as a 25 per cent increase in the transverse diameter of the heart. There were no clinical signs of congestive failure. The temperature subsided gradually with amelioration of symptoms and the patient was again discharged at his request to convalesce at home. Dicumarol was stopped because it was thought that the last three episodes requiring hospitalization had been caused by repeated episodes of pericarditis and not repeated myocardial infarctions. We felt that small episodes of intrapericardial bleeding from excessive anticoagulants conceivably may have been a factor in the last two episodes.

The patient has been followed closely since his last hospital admission. His condition improved steadily and on May 5, 1956, fluoroscopic examination revealed the heart to be of normal size and shape. On June 15, 1956, he had a mild episode of upper chest pain with elevation of temperature to 99 F. and white blood count of 12,100. An electrocardiogram taken that day did not show any new or further changes. The symptoms subsided in 24 hours with analgesics only to occur again for one day on June 18, 1956. Again an electrocardiogram showed no change and again the symptoms subsided in 24 hours with analgesics. Since then the patient has conducted an active business and has been completely asymptomatic. An electrocardiogram taken November 17, 1956, showed no change from that taken June 15, 1956 (Figs. 1, 2).

Discussion

It is of great importance to recognize the post myocardial infarction syndrome and to differentiate it from repeated myocardial infarction, because of the difference in the therapeutic and prognostic implications. Inasmuch as the post myocardial infarction syndrome does not represent further myocardial destruction, the outlook remains good and one can offer more reassurance to the already apprehensive patient and his family.

There is a similarity between the post myocardial infarction syndrome of Dressler and two other conditions also of unknown etiology—namely, idiopathic recurrent pericarditis and the post commissurotomy syndrome. In all three conditions the predominant symptom is anterior chest pain aggravated by breathing and motion. On occasion the pain may be so aggravated by inspiration as to interfere with breathing and cause dyspnea. The temperature, sedimentation rate and leukocyte count rise rapidly, usually within the first 24 hours after onset of pain. This is an important point in differentiating these three conditions from acute myocardial infarction or extension of a previous myocardial infarction, in which the temperature, sedimentation rate and leukocyte count rise on the second or third day concurrent with necrosis.

In the post infarction syndrome, as in benign pericarditis and the post commissurotomy syndrome, the electrocardiogram shows changes characteristic of pericarditis. The reciprocal ST changes and QRS changes of myocardial infarction are absent, which is another important point of differentiation. The serum transaminase remains normal, as it did in our patient on the fourth admission when this test first became available in our hospital. The physical and x-ray findings of pleuritis and pneumonitis, usually in the left hemithorax, are present frequently. The febrile episodes usually last three to seven days and multiple relapses are observed commonly. Constructive phenomena have not been reported.

Dressler believes that the post myocardial infarction syndrome is probably not due to superimposed idiopathic or benign pericarditis because frequency of this syndrome in patients recovering from myocardial infarction exceeded incidence of benign pericarditis in other patients in the same hospital during the same period.

Attempts have been made to implicate the Coxsackie B virus in the etiology of idiopathic recurrent pericarditis due to the resemblance to epidemic pleurodynia, or Bornholm's disease, in which some instances of pericardial involvement have been reported. To date, immunologic studies have been negative or nonconclusive. A tuberculous etiology is also unlikely because constrictive phenomena have not been described and the tubercle bacillus has never been recovered in this condition. The eosinophilia often seen in the pleural exudate has led some to consider an allergic mechanism. Eosinophilia, however, is a finding in the pleural exudate arising from many diverse conditions.

Dressler,[3] in a comparison of idiopathic pericarditis and the post commissurotomy syndrome, seems to favor a common rheumatic etiology for both conditions, although he freely acknowledges some of the shortcomings in that (1) there is usually no myocarditis associated with either condition, (2) the serologic tests for rheumatic activity are usually negative and (3) the course is usually benign.

With the extensive present day use of anticoagulants in the management of patients with myocardial infarction, one might assume that the repeated episodes of pericarditis could be due to oozing of blood into the pericardial sac. However, in the case reported this mechanism is unlikely because the first episode of pericarditis occurred before anticoagulants had been started and two minor episodes occurred after anticoagulants had been stopped.

In a subsequent report, Dressler[4] indicated that he has observed 10 more patients with this syndrome of whom 5 were treated with prednisone with excellent results. Our patient was not given prednisone but we mention this point as a possible mode of therapy. The response to prednisone also implies the nonspecific nature of this problem.

Summary

1. A case is reported which closely resembles the post myocardial infarction syndrome as reported by Dressler.

2. This syndrome must be differentiated from repeated or progressive infarction.

3. The condition is similar to idiopathic recurrent pericarditis and the post commissurotomy syndrome.

4. Etiology of this syndrome is unknown as yet. •

AMA Drafts New Law To Cut Poison Deaths

After a 15 months' study, the Committee on Toxicology of the American Medical Association announced January 29 that it has formulated a broad and encompassing model law for the precautionary labeling of hazardous substances in commercial, household, and industrial chemical products.

Speaking before the Section on Food, Drug & Cosmetic Law of the New York Bar Association, Bernard E. Conley, Ph.D., Chicago, secretary of the AMA committee, said the proposed legislation is intended as a model for uniform laws to require declaration of hazardous ingredients and warning statements on the label and in the accompanying literature of chemical products used in the home and elsewhere.

"The proposed model law," Conley said, "was drafted after an exhaustive review of existing statutes revealed a hodge-podge of local regulations for the labeling of chemicals."

The law is directed against those hazardous substances defined as toxic, irritating, sensitizing, corrosive, flammable, explosive, or radioactive under customary or reasonably anticipated conditions of handling and use.

The law, as drafted by the AMA committee headed by Torald Sollmann, M.D., Cleveland, Ohio, would:

—Require the labeling of all chemical products containing hazardous substances which are not now regulated.

—Require the same labeling standards to apply to chemicals for export as those for domestic consumption, thereby obviating the common complaint that less-than-standard products are sold to foreign customers.

—Prohibit re-use of food and drug containers bearing their original labels.

—Require identification and warnings for strongly sensitizing chemicals which cause allergic or inflammatory reactions in living tissue on contact.

Conley said a significant departure in drafting the new law was deletion of the word "poison" from the bill's provisions. This decision was reached, he said, after surveys showed a wide variation in existing legal limits for poison and a lack of agreement among scientists on a definition of the term.

Bonadoxin in Nausea and Vomiting of Pregnancy

J. W. Codling, M.D.
AND
R. J. Lowden, M.D.
SEATTLE, WASHINGTON

Although maternal deaths or interrupted pregnancies resulting from nausea and vomiting are now rare, a high percentage of pregnant women are affected by this undesirable condition. Usually of mild nature, the characteristic symptoms occur in the fifth or sixth week of pregnancy and subside ordinarily after three months. However, a large number of women experience moderate to severe nausea and vomiting throughout their pregnancy and create a serious problem for the physician.

Predisposing factors such as psychogenic disorders, allergy, nutritional deficiencies, and endocrine disturbances have been considered in the determination of the etiology, but up to the present time the origin of this condition is unknown. A large variety of preparations have been used in the past including progestin,[1] menadione combined with ascorbic acid,[2] adrenal muscular pyridoxine combined with suprarenal cortex,[5] all of which relieved the patients partially, but not entirely, from their symptoms. Recently, a number of clinical investigators,[6-9] have used Bonadoxin in the treatment of various degrees of nausea and vomiting in pregnancy. Their reports reveal a very high percentage of relief, ranging from 88 per cent to 95.7 per cent. The highest percentage of response (95.7 per cent) was recorded in a study of 287 patients, the lowest (88 per cent) in a series of 100 patients. Stimulated by these reports and encouraged from our own preliminary clinical investigations, we initiated a study of 76 pregnant patients, using Bonadoxin* in all cases.

Materials and Methods

The antiemetic preparation used in this study is a combination of meclizine hydrochloride 25 mg. and pyridoxine hydrochloride 50 mg. Age of the 76 patients treated ranged from 18 to 36. Need for therapy usually occurred one and one-half to four months after the patients' estimated date of conception.

Three dosage schedules were followed (see table 1). This plan facilitated management and allowed adjustments of medication according to severity of symptoms and time of their occurrence. Thus, patients with light to moderate nausea and vomiting were given 1 tablet at bedtime for 15 to 25 days, which was usually sufficient. The other group of patients, with pronounced nausea and vomiting, received 2 tablets at bedtime for 3 to 5 days, after which they reported that their symptoms were less severe. Then, 1 tablet before retiring for 7 to 36 days was prescribed depending on response. Several women had to be treated according to the time of occurrence of their nausea and vomiting. They were given 1 tablet in the morning and 1 at night for 3 to 5 days. Then, after they responded favorably, the dosage was reduced to one tablet at bedtime for 15 to 30 days. In addition to the tablets, four patients were given 1 to 3 multiple vitamin-mineral capsules daily, and three patients received Nembutal as conjunctive medication. Cortisone, given parenterally or orally, was administered to another six patients in conjunction with the antiemetic preparation.

Table 1. Bonodoxin Dosoge Schedule for Vorious Degrees of Nousea ond Vomiting in Pregnoncy.

Moderote Symptoms	Pronounced to Severe Symptoms	Dosoge According to Time of Occurrence of Symptoms
1 tablet Q.H.S. for 15 to 25 days.	2 tablets Q.H.S. for 3 to 5 days, then 1 tablet Q.H.S. for 7 to 36 days.	1 tablet A.M., 1 tablet P.M. for 3 to 5 days; then, 1 tablet H.S. for 15 to 30 days.

The senior author of this paper was a pharmacist and taught pharmacy before entering medical school. Ed.

Metabolic Effects of Meclizine and Pyridoxine

Meclizine, one of the two constituents in the formula, is an antihistaminic. Its structural formula, as can be seen in figure 1, is unique in that it differs from other closely related antihistaminics by containing three benzylic rings, rather than two. Toxicity studies in animals revealed that

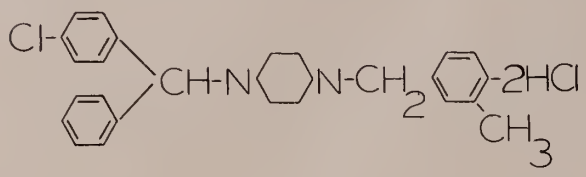

Fig. 1. Chemical formula for meclizine dihydrochloride.

meclizine is considerably less toxic than other antihistiminics used clinically, including dimenhydrinate. Its antihistaminic activity, determined by the duration of effective protection of guinea pigs against intravenously injected or nebulized histamine, was found far superior to comparable doses of other antihistaminics in current use.

Clinically, Verdonk used meclizine in 237 patients with allergic disease[10] and found its tolerance to be excellent on a daily dose of 25 mg. to 100 mg., in single or divided doses. Other beneficial actions of meclizine are its anticholinergic properties and freedom from side reactions, such as blurred vision, dry mouth and throat, and hypotensive effect.[11,12] Its therapeutic action in the nausea and vomiting of pregnancy is believed to be by blocking the nausea-vomiting reflex, either by direct inhibition of the emetic trigger zone in the pons or by depression of the labyrinthine apparatus or both. A definite advantage of the antihistaminic is its prolonged duration of action—up to 24 hours—after administration of a single 25 to 50 mg. dose.[13] This latter property is especially desirable, since it eliminates the inconvenience and annoyance of frequent doses.

Pyridoxine (vitamin B_6) supplementation plays an important role in the enzyme systems governing the metabolism of fats, carbohydrates, and amino acids.

In an intracellular process, when pyridoxal phosphate combines with specific protein enzymes, this combination can act as transaminase, decarboxylase, and desulfurase. All of these reactions are reversible.[14] As a result of these biochemical processes, vitamin B_6 provides raw material for the tricarboxylic acid cycle (Krebs cycle) which is one of the essential energy sources in the body, and the main sequence of carbohydrate oxidation in the body tissues.

Clinically, the necessity of pyridoxine supplementation in pregnancy is pointed out by Wachstein and Gudaitis.[15] In their article they discuss two ways of determining pyridoxine deficiency in pregnant women: (1) by the oral administration of 10 Gm. dl-tryptophan to subjects deficient in vitamin B_6, and (2) by a vitamin B_6 load test in which 25 mg. of oral pyridoxal hydrochloride is given. In the former test an abnormal metabolite, xanthurenic acid, was excreted in the urine in appreciable amounts after administration of dl-tryptophan. This abnormally high concentration of xanthurenic acid may be caused by a pyridoxine deficiency occurring in pregnancy, resulting in an incomplete metabolism of trytophan—one of the essential amino acids. The chemical structure of pyridoxine is shown in figure 2.

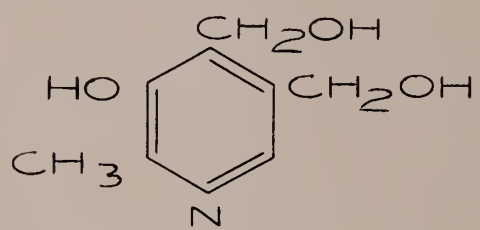

Fig. 2. Chemical formula for pyridoxine.

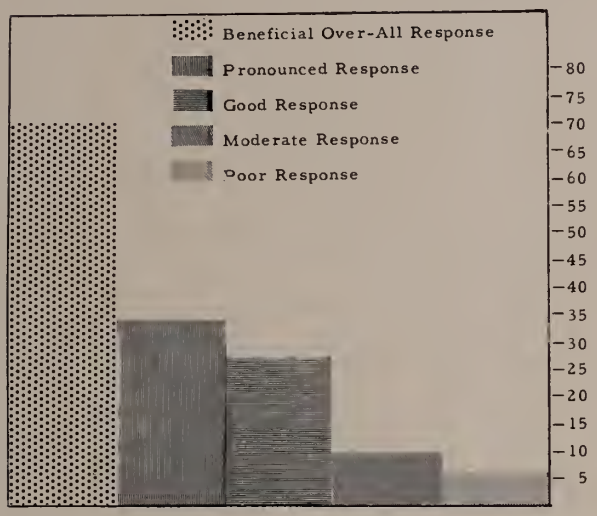

In the latter test in which 25 mg. of vitamin acid in full-term normal and toxemic women was found to be smaller than in the nonpregnant control subjects. Thus, pregnant women retain administered vitamin B_6 to a much larger extent than nonpregnant women.

The enzymatic role of pyridoxine was studied by Glendening, Cohen, and Page,[16] who investigated the effect of pyridoxine supplements on transaminase activity of fetal and maternal tissues. Their data revealed that the addition of 10 mg. of vitamin B_6 to the daily diet of pregnant women for several weeks resulted in significant increase in transaminase activity. They also found that the transaminase system of infants is well supplied with pyridoxal or pyridoxamine cofactors, probably at the mother's expense. The authors conclude that the data are compatible with the view that pyridoxine supplementation is desirable in human pregnancy.

Results of Therapy

Results of this study are shown graphically in Chart I. Combining all positive responses, an overall benefit from Bonadoxin in 70 (92.1 per cent) of 76 patients treated was observed.

Chart I

Results of Benadoxin therapy in 76 pregnant potients.

As can be seen from the different dosage schedules (table 1), treatment was individualized, and dosages were adjusted according to the response of the patients. At least three patients, however, responded almost immediately to the preparation. They had been vomiting continuously prior to treatment. The following criteria were used for the evaluation of the therapeutic action: A *pronounced* response was recorded when the patient responded to therapy within one to two weeks, with no recurrence of symptoms; therapy was continued to 25 days for prophylactic purposes; a *good response* was recorded when the patient responded within two to three weeks, but slight nausea occurred occasionally and dosage had to be increased to alleviate all symptoms; and, a *poor response* was recorded for patients who did not, at any time, respond to therapy.

All women accepted and tolerated the tablets well. There was no correlation between age of the patients and their response to the preparation. Two patients reported a potentiation of therapeutic effect when Nembutal was given in conjunction. Cortisone administered to three patients who responded poorly to the antiemetic preparation had no beneficial action, and made one patient feel even worse.

It is recommended to continue administration of Bonadoxin for some time even when the patient has not responded after three to four days. Some of these patients seem to need reasonable time to adapt themselves to the preparation which probably accounts for their delayed response.

Summary

1. Bonadoxin is an antiemetic preparation consisting of two therapeutic agents: meclizine dihydrochloride and pyridoxine hydrochloride.

2. This preparation was used in 76 pregnant patients with nausea and vomiting over a period of one to eight weeks; severe cases required prolonged or individualized treatment.

3. The results indicated an overall response in 70 (92.1 per cent) of 76 patients treated. Specifically, 34 women experienced pronounced relief; 27 had a good response; 9 a moderate response, and 6 patients did not benefit from treatment. No side reactions were observed in this clinical study. •

Control of Anorectal Hemorrhage with Balloon Catheter

GEORGE R. MARSHALL, M.D.
SEATTLE, WASHINGTON

The following brief case report illustrates a potential situation after any anorectal surgery:

Nine days following resection of combined hemorrhoids, a woman aged 52 was returned to the hospital with acute, massive rectal hemorrhage. She was apprehensive, pale and perspiring freely. On the toilet she had evacuated a large amount of fresh blood and clots. Her erythrocyte count was 3.5 million, hemoglobin 10.6 Gm. and hematocrit 32.5.

The bleeding was controlled by simple means—the insertion of a 75 cc. balloon (Bardex) catheter into the rectum with traction and counter pressure. She was discharged two days later.

This simple method for control of anorectal bleeding was reported by me previously and its usefulness has since been confirmed by Israel's report.[1,2] Further experience has shown a catheter of 75 cc. capacity to be better than the 30 cc. size originally recommended. The smaller size is occasionally expelled prematurely.

In more detail the procedure is this:

The patient is placed in a lateral position and, after testing, a well lubricated 75 cc. catheter is inserted about 4 inches into the rectum. No anesthesia is necessary. The balloon is inflated with 60 cc. of air or water and the inflation tube closed. Parenthetically, for inflation purposes, a 1 ounce rubber infant syringe works better than the glass-plunger type.

Downward traction is exerted on the catheter so that pressure is brought to bear on the anorectal ring; this is maintained by taping the catheter to the buttock. Counter pressure from below is exerted by means of a perineal pad and T-binder.

A sponge is placed over the end of the catheter so that further bleeding, if it occurs, can be observed. The catheter can be kept clear with gentle saline irrigations. Escape of gas and fluid through the catheter reduces the stimulation of the bowel movement reflex and the balloon is well tolerated by patients. The balloon is deflated and removed in 24 hours.

Postoperative hemorrhage is one of the chief complications of anorectal surgery and may occur within a few hours or as late as 10 days after operation. It occurs at inopportune times and places, and can be hazardous. Bleeding is usually from one or more marginal vessels at the operative site and, when severe, usually saturates the peri-anal dressings. Frequent inspection of the dressings during the immediate postoperative period should be specified as an order on the patient's hospital chart.

In the past it has been necessary to re-anesthetize the patient to locate and ligate the bleeding point. This is a disturbing procedure with additional risk in terms of additional trauma, danger of infection and re-anesthetization under circumstances which may be far from ideal. The catheter method is non-traumatic and effective. The catheter takes little space in one's bag and can be used equally well in the hospital or home. •

Male Infertility

Louis J. Scheinman, M.D.
SEATTLE, WASHINGTON

Infertility of a couple means failure to establish pregnancy after one year of normal marital behavior. Formerly regarded as essentially a woman's problem with little responsibility attached to the husband, it is now considered one in which the husband is at fault nearly as often or even more often than the wife.[1] Both partners, of course, should be investigated. This concept is achieving wider acceptance by patients and physicians.

In a group of 70 males whose wives were pronounced gynecologically normal, I have found impairment of the fertility index in 45. This took the form of low count, a high percentage of abnormal forms, or poor motility sometimes accompanied by chronic prostatitis (other cases of good motility were also accompanied by prostatitis). The figure does not imply that in all cases of infertility the male partner is more frequently at fault than his wife. I was not referred many husbands of women whose infertility had been accounted for. The figure does suggest the male partner is *often* at fault in a childless marriage.

In reviewing minimal normal concepts of male fertility index we find variation of opinion. Some believe sperm motility to be more important than sperm count provided the count is at a certain minimal level. McCleod[2] feels that as the percentage of morphologically normal cells increases there is an increasing fertility potential. He suggests it is unnecessary to raise a count of 20 million to 60 or 70 million per cc. if motility and morphology are normal. Quantity is utilized by some to classify high fertility as more than 185 million active sperm, relative fertility as 80 to 185 million active sperm, and subfertility as less than 80 million active sperm in the ejaculate. A widely accepted classification of minimal standards for male fertility includes volume of 2.5 cc. morphology of 80 per cent normal forms, motility of 38 per cent active sperm, and a count of 20 million active sperm per cc.

Absolute sterility is found in only a small per cent of infertile males. Common causes are undescended testes, failure of development of testicular germinal epithelium, mumps orchitis, atrophy of germinal epithelium secondary to radiation, atrophy of both testes secondary to hernia repair, congenital absence of epididymis or ductus defferens or both, and bilateral occlusion of ductus defferens, usually due to gonorrhea.

Temporary sterility may be produced hormonally or by fever. Germinal epithelium is sensitive to environmental changes, and heat inhibition (104 F. for 90 minutes) has been shown to depress the sperm count for a variable period of two to four weeks followed by slow return to normal.[2] Therefore sperm studies should take into account any recent febrile illness. Interestingly, tests on athletes have demonstrated that extreme fatigue does not affect sperm counts.

Methods of Diagnosis

Variety in frequency of intercourse in healthy adults is considerable, ranging from semi-monthly to almost nightly in this series. There is apparently no familial tendency for infertility; usually brothers and sisters are quite fertile. These 70 husbands of infertile marriages have habits of diet, work, and recreation in no way unusual or abnormal. Nothing remarkable was obtained from their medical or social history other than their failure to impregnate their wives.

Physical examination always included a prostatic massage, repeated in a few days if the

microscopic picture was normal. Chronic prostatitis was frequently associated with poor motility. In these instances, treatment was instituted. It consisted of massages at five day intervals, chemotherapy, and argyrol instillations in cases having urethral discharge. After 5 to 10 massages the microscopic picture usually improved to less than 20 wbc/hpf.

Sperm examination is done after a five day period of abstinence. The specimen is collected in a dry glass jar either by masturbation or coitus interruptus, kept at room temperature, and examined within three hours. A condom is never used because of its spermicidal effect. Volume, count, morphology (appearance of stained fixed cells), motility, motility after four hours and after 24 hours, are reported. The counts of highly fertile males remain constant on reexamination. Repeat counts in this group are probably unnecessary. The counts of relatively fertile and subfertile men are more variable, making reexamination necessary. Germinal epithelium is similar to bone marrow in producing characteristic morphology in all specimens from the same individual under normal conditions.

In cases of no sperm in the ejaculate it must be determined whether there is obstruction or lack of production. Michelson[3] reports on hyaluronidase concentration in the semen as a test for patency of the vasoepididymal ducts. This enzyme is elaborated in the testes. Its presence in semen without spermatozoa suggests there is incomplete degeneration of germinal epithelium and indicates patency of the vasa and epididymal ducts. Enzyme substrates are available to do this test, and it may be of significance if therapy advances beyond its present state. Testicular biopsy is of help in planning therapy.

Further investigation of patients presenting azoospermia is done in the hospital. Under spinal or general anesthesia a panendoscope is passed into the prostatic urethra and attempts are made to catheterize the ejaculatory ducts located on either side of the verumontanum. If catheters can be entered into these orifices, radiopaque solution is injected and x-rays are made. The tortuous seminal vesicles and the vasa are seen on the film. An obstruction of the vas can thus be visualized. Often retrograde injection is unsuccessful because of technical problems in finding and catheterizing these ducts. In any event, the next step is surgical exposure and exploration of the scrotal contents bilaterally. If vaso-grams were not successfully made, a 22 gauge needle is inserted into the vas near its origin, radiopaque solution injected and x-rays taken to outline the vas and seminal vesicles. The presence of dye in the vesicles (Fig. 1) indicates a patent vas.

Fig. 1. Retrograde vaso-seminal vesiculography (injection of vas near vasoepididymal junction; x-ray demonstrates patency with dye reaching urinary bladder).

(If obstruction were found, resection and end-to-end anastomosis would be performed, after first demonstrating a patent proximal segment.)

Needle aspiration of the upper pole of the epididymis must now be examined microscopically. Even if an obstruction of the vas has been discovered, there may also be inflammatory obstruction of the epididymis in its globus minor, the portion most often involved by infection. If spermatozoa are seen in the secretion aspirated from the globus major of the epididymis in an azoospermic patient, then the patent vas deferens is anastomosed to this structure by incising into an epididymal duct and joining both channels side to side.

The next step is testicular biopsy, performed whether or not sperm were present in the epididymal aspiration. This is done to better evaluate spermatogenic function of the gonad and to help decide on the use of hormonal therapy. After inserting a sliver drain and closing the scrotal incision on one side, the procedure is repeated on the other side.

Therapy

Androgen therapy is based on the rebound phenomenon after suppression. Sometimes this does not happen. McDonald and Hechel[4] report

a series of 93 cases in which 28 (38 per cent) rebounded at least 50 million per cc. over pretreatment level and 20 pregnancies ensued. Testosterone propionate was given in 50 mg. doses intramuscularly three times weekly. Forty-five did not rebound. Biopsies showed marked germinal cell atrophy in these cases and indicated that they were unsuitable for this therapy. They feel that testosterone is indicated when biopsy reveals disorganized spermatogenesis or incomplete germinal cell arrest, and is of no value if biopsy shows germinal cell atrophy or extensive areas of regional fibrosis.

Estrogens have been used in small doses (0.1 mg. stilbestrol daily) to stimulate spermatogenesis. Herrold[5] reports an increase in the sperm count of 20 of 39 patients. Larger doses of estrogen[6] act by pituitary depression, which leads to inhibition of testicular hormone production. Two or three months after withdrawal, spermatogenesis returns, often with improved sperm output.

Pregnenolone (the 3-hydroxy analogue of progesterone) is thought to enhance fertilizing capacity of sperm by changes in their enzyme systems or by stimulating fructose secretion. Turly and Shaw[7] report 40 cases treated with 50 mg. intramuscularly weekly, increasing the dose by 50 mg. each month for three months. Improvement of sperm count and motility was observed in 37.5 per cent and pregnancy occurred in 20 per cent of these cases within one year.

Anterior pituitary hormones which affect the testes are of two types. FHS (follicle stimulating hormone) appears to act mainly on spermatogenic epithelium, and L.H. (luteinizing hormone) acts principally on interstitial cells. Their increased activity results in stimulation of accessory genital structures. A combination causes more spermatogenesis than FSH alone. Apparently, chorionic gonadotropins (prepared from pregnant mares' serum) are not as effective as pituitary gonadotropins (prepared from beef hypophyses). Theoretically, pituitary gonadotropins should be excellent for spermatogenesis, but results are inconsistent and often disappointing. Tyler[8] suggests a regimen of 4 to 5 cc. daily for two weeks and reports good results in some instances with this high dose.

Hep-Forte is a nutritional supplement advocated by its manufacturer (Marlyn) in the treatment of deficiencies caused by or associated with disordered hepatic function. This includes the nebulous state of estrogen-androgen imbalance causing relative hyperestrinism which is accompanied by impaired spermatogenesis. Evans[9] claims that a diet may be adequate for body growth and yet grossly inadequate for normal reproductive physiology. Inability of the liver to inactivate estrogens has been shown to occur in the absence of morphologic changes.[10] In contradistinction to this impairment, the liver does not lose ability to destroy androgen in B-vitamin deficiency states. Therefore, a serious estrogen-androgen imbalance may result (Glass[11]). Glass and Lazarus[12] report increased fertility in their series, treated with 15 capsules of this medication daily.

Cytomel (l-triiodothyronine), a thyroid-like substance, is claimed to improve cellular metabolism in cases where decreased metabolism originates in the peripheral tissues due to faulty ultilization of thyroxine. L-triiodothyronine is the effective form into which thyroxine must be converted in the cells to be effective. Farris[13] reports 5 pregnancies occurring in previously childless couples during treatment of 16 subfertile husbands with 5 to 25 mcg. daily. In each of these cases the semen picture showed definite improvement in motility and count at the time of conception. Within several weeks following cessation of medication the sperm indices fell to pretreatment levels.

Clinical Study

Effects of Cytomel were studied in 14 men, between 25 and 37 years of age, who had failed to impregnate their wives despite normal attempts for at least two years. All female partners had been examined and declared capable of becoming pregnant. Cytomel was used for four weeks. Daily dose for the first week was 5 mcg. It was increased 5 mcg. each week. Sperm studies were done before and after treatment.

A fifteenth case was excluded from the study because he failed to return for post-treatment examination after his wife had become pregnant. In preliminary tests he had volume of 8 cc.; count, 66 million; motility, 60 per cent initially and 35 per cent after 24 hours; morphology, 30 per cent abnormal forms.

There was improvement in sperm count in seven patients (table 1). In case 1, with increase of 33 per cent in count, there was also improvement in motility and morphology. Case 2 had only insignificant improvement in count which is consistant with his failure to improve motility

and morphology. There was 100 per cent or more improvement in count in cases 3, 5, 6, and 7 but changes in morphology and motility were erratic. Case 6 was continued on Cytomel and showed complete aspermia after four months.

Case 4 improved his count per cc. approximately 50 per cent but lost total count because of decrease in volume. His pretreatment total, including only motile sperm, was 34.8 million and the post-treatment count, 19.8 million. His high percentage of abnormal forms was not changed appreciably and still further reduced the effective total.

Reduction in counts per cc. occurred in half the cases in this series and in 4 the counts dropped markedly. Effects on morphology and motility were variable. Impairment of motility was noted more frequently than low count and may be of more significance as an index of infertility. Abnormal morphology also was noted more frequently than low count.

Six cases in the series had chronic prostatitis. In only one of these was motility improved by Cytomel. Only 2 of the 6 had more than 50 per cent motile forms. However, the 2 cases of the series with lowest motility did not have prostatitis.

No pregnancies occurred in the wives of the 14 men in this series. The fifteenth case, who did impregnate his wife, was excluded because he did not report for post-treatment examination.

Table 1.

Case	Age	Count (million per cc.) Before	Count (million per cc.) After	Abnormal Forms % Before	Abnormal Forms % After	Motility % Before	Motility % After	24 Hr. Motility % Before	24 Hr. Motility % After	Volume cc. Before	Volume cc. After

*Chronic prostatitis.

Observations reported by Culp[14] in 1950 on a series of 200 cases of infertility are of interest. Incidence of pregnancy among 78 patients under therapy (thyroid, vitamin E, testosterone, and pituitary hormone in varying combinations) was the same as in 85 untreated cases.

It seems a reliable spermatogenic drug is not yet available. Of importance is the mental and physical health of our patients, which may be improved by various hormones, nutritional supplements and by our encouragement. •

AUTHENTIC ANTICHOLINERGIC ACTION

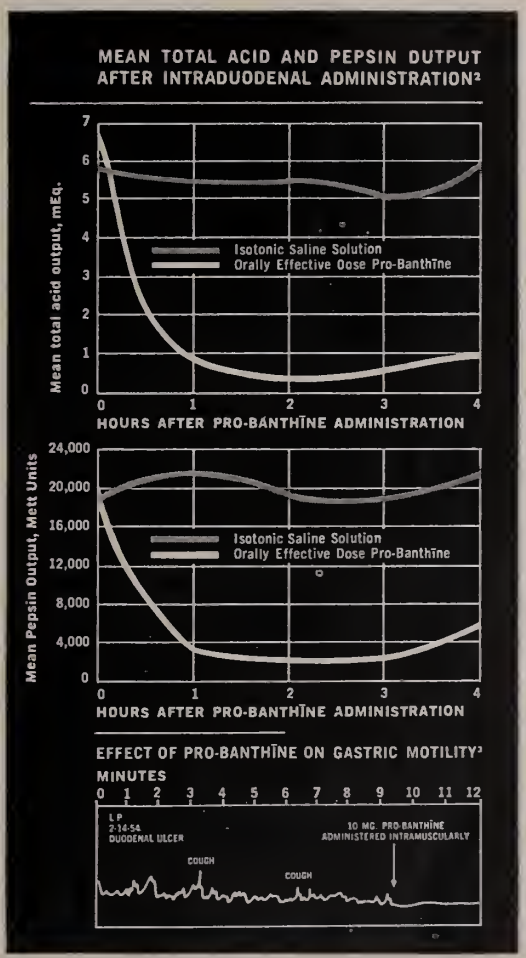
". . .experimental and clinical studies . . . have demonstrated[1] many advantages."

Pro-Banthīne®

(BRAND OF PROPANTHELINE BROMIDE)

Blocks Parasympathetic Hyperactivity, thus Encouraging Mucosal Regeneration in Peptic Ulcer

Whenever it is necessary to alleviate peptic ulcer pain and to control associated gastric hyperacidity and hypermotility, Pro-Banthīne is the anticholinergic chosen by a high percentage of physicians throughout the United States and Canada.



Pro-Banthīne is preferred because it rapidly relieves pain and hastens healing with minimal side reactions.

Barowsky[1] reflects a large segment of professional opinion when he states:

"We prefer to use Pro-Banthīne because we have had greater and more satisfactory experience with it. Our experimental and clinical studies with the drug have demonstrated many advantages. Apparently, not all the anticholinergic drugs affect all the organs innervated by the parasympathetic to the same degree. Whereas, more extensive side-effects have been encountered with relatively smaller amounts of other drugs, fewer patients experienced innocuous side reactions with massive doses of Pro-Banthīne."

The initial dosage is one 15-mg. tablet with meals and two tablets at bedtime. For severe manifestations two or more tablets four times daily may be prescribed. Pro-Banthīne is supplied in 15-mg. sugar-coated tablets.

Lederle

The Achievement in Skin Diseases: In a study of 26 patients with severe dermatoses, ARISTOCORT was proved to have potent anti-inflammatory and antipruritic properties, even at a dosage only ⅔ that of prednisone.[1]... Striking affinity for skin and tremendous potency in controlling skin disease, including 50 cases of psoriasis, of which over 60% were reported as *markedly improved*[2]... absence of serious side effects specifically noted.[1,2,3]

The Achievement in Rheumatoid Arthritis: Impressive therapeutic effect in most cases of a group of 89 patients[4]...6 mg. of ARISTOCORT corresponded in effect to 10 mg. of prednisone daily (in addition, gastric ulcer which developed during prednisone therapy in 2 cases disappeared during ARISTOCORT therapy).[5]

13. Dubois, E. L.: Personal Communication.

The Achievement in Respiratory Allergies: "Good to excellent" results in 29 of 30 patients with chronic intractable bronchial asthma at an average daily dosage of only 7 mg.[6]... Average dosage of 6 mg. daily to control asthma and 2 to 6 mg. to control allergic rhinitis in a group of 42 patients, with an actual reduction of blood pressure in 12 of these.[7]

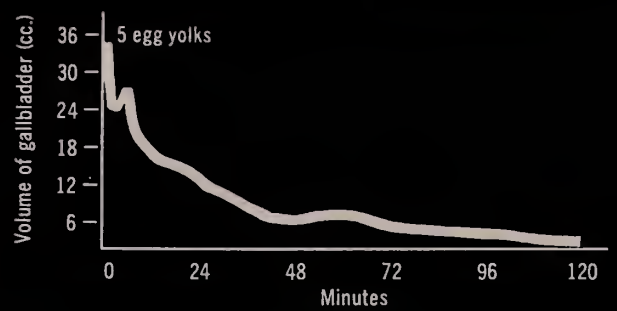
The Achievement in Other Conditions: Two failures, 4 partial remissions and 8 cases with complete disappearance of abnormal chemical findings lead to characterization of ARISTOCORT as possibly the most desirable steroid to date in treatment of the nephrotic syndrome.[8,9]... Prompt decrease in the cyanosis and dyspnea of pulmonary emphysema and fibrosis, with marked improvement in patients refractory to prednisone.[10,11,12]... Favorable response reported for 25 of 28 cases of disseminated lupus erythematosus.[13]

ocort®

Triamcinolone LEDERLE

Depending on the acuteness and severity of the disease under therapy, the initial dosage of ARISTOCORT is usually from 8 to 20 mg. daily. When acute manifestations have subsided, maintenance dosage is arrived at gradually, usually by reducing the total daily dosage 2 mg. every 3 days until the smallest dosage has been reached which will suppress symptoms.

Comparative studies of patients changed to ARISTOCORT from prednisone indicate a dosage of ARISTOCORT lower by about ⅓ in rheumatoid arthritis, by ⅓ in allergic rhinitis and bronchial asthma, and by ⅓ to ½ in inflammatory and allergic skin diseases. With ARISTOCORT, no precautions are necessary in regard to dietary restriction of sodium or supplementation with potassium.



ARISTOCORT is available in 2 mg. scored tablets (pink), bottles of 30; and 4 mg. scored tablets (white), bottles of 30 and 100.

CLINICAL BRIEFS FOR MODERN PRACTICE

"EMPTYING" OF GALLBLADDER AFTER FATTY MEAL*

*Adapted from Wright, S.: Applied Physiology, ed. 8, London, Oxford University Press, 1947, p. 734.

What's wrong with the term "emptying of the gallbladder"?

The gallbladder discharges bile by fractional evacuation. It is not emptied completely at any one time even following a fatty meal.

Source—Lichtman, S. S.: Diseases of the Liver, Gallbladder and Bile Ducts, ed. 3, Philadelphia, Lea & Febiger, 1953, vol. 2, p. 1177.

respiratory congestion orally

"This affords opportunity for shrinkage in areas that could not be approached by sprays, drops or actual topical applications."

—Morrison, L. F.: Arch. Otolaryng. 59:48-53 (Jan.) 1954.

Comparison of action of topical decongestants and an orally administered decongestant

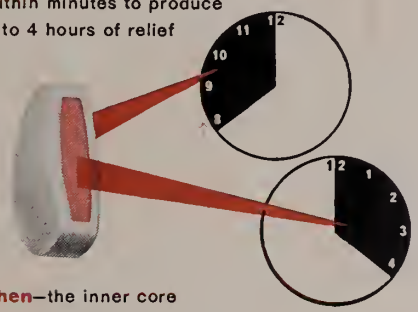
TOPICAL DECONGESTANT	TRIAMINIC ORAL DECONGESTANT
Duration of relief is brief	*Keeps nasal passages clear 6 to 8 hours*
Decongestion often followed by secondary congestion which may be equal to or even worse than the original condition	*Secondary congestion does not occur*
Local overtreatment may cause pathological changes in nasal mucosa	*No pathological changes in nasal mucosa*
Patients frequently experience "nose drop addiction"	*The "nose drop addiction" phenomenon does not occur*
Much of the medication is washed away by nasal mucus. Mucus often forms a barrier between the medication and the nasal mucosa	*Not affected by nasal mucus. Gets into the blood stream so that it has intimate and prolonged effect on nasal mucosa*

The Triaminic form and formulation, described in detail on the next page, have proved remarkably effective as an oral decongestant.

respiratory congestion orally

relief in minutes... lasts for hours

In the common cold, nasal allergies, sinusitis, and postnasal drip, one timed-release Triaminic tablet brings welcome relief of symptoms *in minutes*. Running noses stop, clogged noses open—and *stay* open for 6 to 8 hours. The patient can breathe again.



With *topical* decongestants, "unfortunately, the period of decongestion is often followed by a phase of secondary reaction during which the congestion may be equal to, if not greater than, the original condition. . . ."* The patient then must reapply the medication and the vicious cycle is repeated, resulting in local overtreatment, pathological changes in nasal mucosa, and frequently "nose drop addiction."

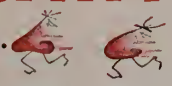
Triaminic does not cause secondary congestion, eliminates local overtreatment and consequent nasal pathology.

*Morrison, L. F.: Arch. Otolaryng. 59:48-53 (Jan.) 1954.

Each double-dose "timed-release" tablet keeps nasal passages clear for 6 to 8 hours—provides "around-the-clock" freedom from congestion on just three tablets a day

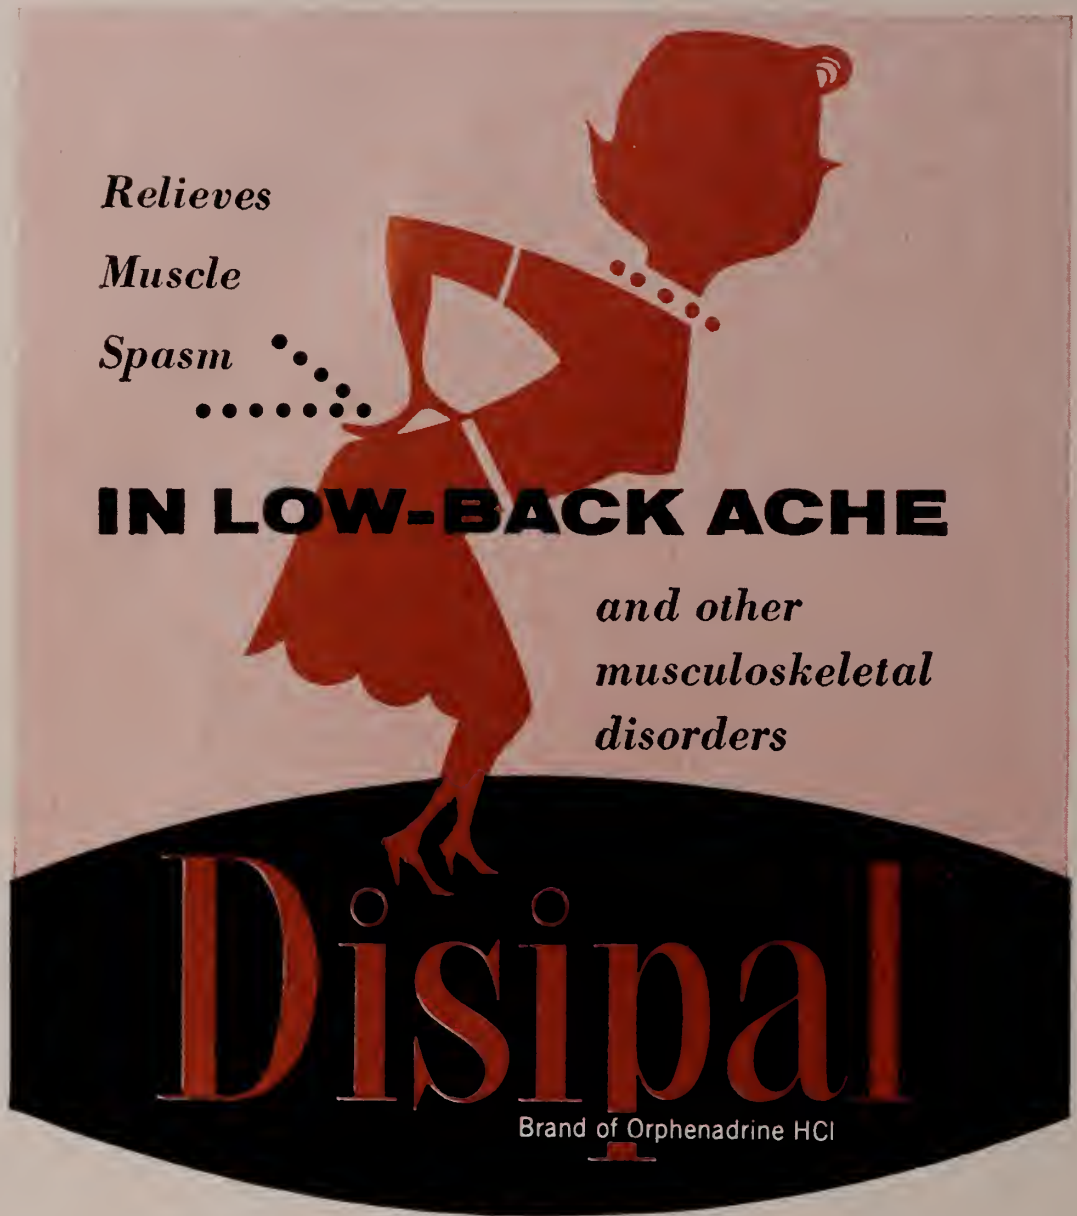
first—the outer layer dissolves within minutes to produce 3 to 4 hours of relief

then—the inner core disintegrates to give 3 to 4 more hours of relief



Each double-dose "timed-release" TRIAMINIC *Tablet contains:*

Phenylpropanolamine hydrochloride	50 mg.
Pyrilamine maleate	25 mg.
Pheniramine maleate	25 mg.



Dosage: 1 tablet in the morning, afternoon, and in the evening if needed.

Also available: Triaminic Syrup, for children and and those adults who prefer a liquid medication.

Triaminic® *"timed-release" tablets*

stop running noses...  *and open stuffed noses orally*

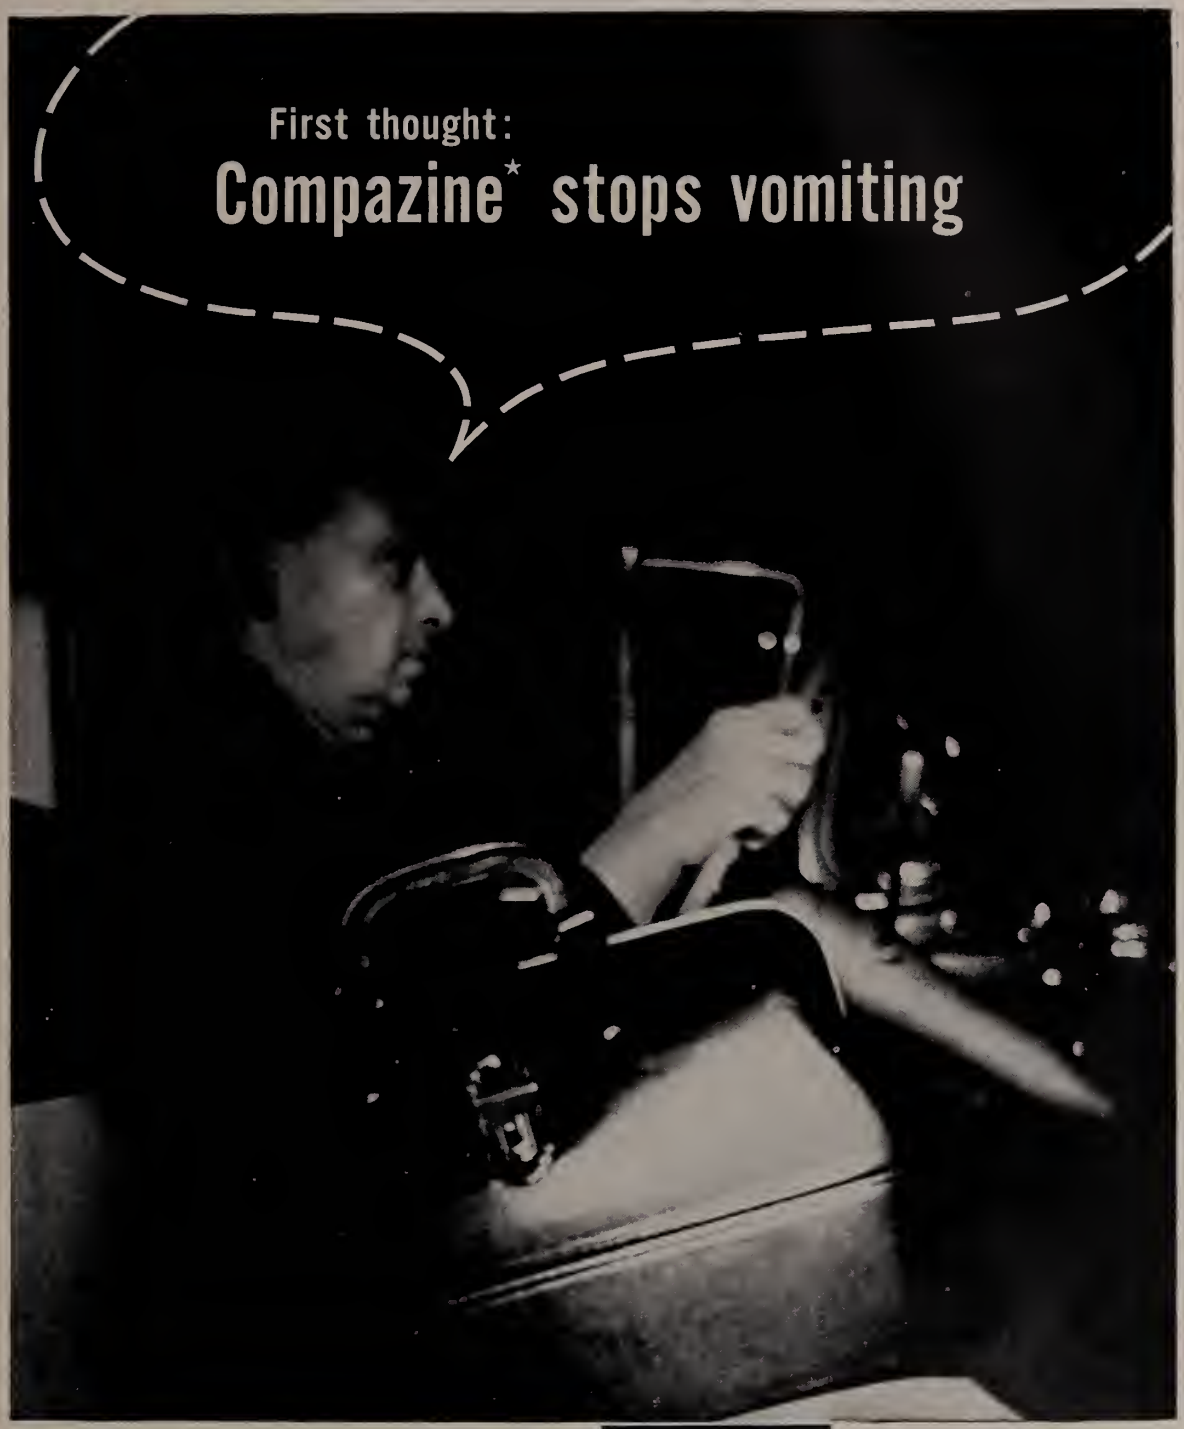
In Parkinsonism

Highly selective action...energizing against weakness, fatigue, adynamia and akinesia...potent against sialorrhea, diaphoresis, oculogyria and blepharospasm... lessens rigidity and tremor... alleviates depression...safe... even in glaucoma.

*Trademark of Brocades-Stheeman & Pharmacia. U.S. Patent No. 2,567,351. Other patents pending.

Relieves Spasm, Pain, and Depression too



In muscle spasm due to sprains, strains, herniated intervertebral disc, fibrositis, noninflammatory arthritic states and many other musculoskeletal disorders, the first demand is for relief. Disipal fills this need. It is quickly effective in skeletal muscle spasm almost regardless of origin. Its mood-alleviating effect braces the patient against the depression so often accompanying severe pain of any type.

Dosage: 1 tablet (50 mg.) t.i.d.

Diamox*

ACETAZOLAMIDE LEDERLE

nonmercurial
diuretic

DIAMOX effectively produces weight loss through fluid loss in pregnant patients with visible or occult edema, pre-eclampsia, hypertensive disease, and decompensated heart disease.[1]

DIAMOX was administered to 106 pregnant patients, on regular or prescribed diets. The majority were ambulatory and all either had more than the normal amount of visible edema and/or gained more than the average of 1 kg. per week. Response with DIAMOX showed that edema fluid can be removed effectively: 500-2000 Gm. in 24-72 hours, and as much as 11 kg. within 7 days.

A highly versatile diuretic, DIAMOX is particularly advantageous in prenatal management. Lack of taste, ease of administration, and lack of renal and gastrointestinal irritation make its use simple and relatively free of complications.

Supplied: Scored tablets of 250 mg.; Syrup containing 250 mg. per 5 cc. teaspoonful; Ampuls of 500 mg. for parenteral use.

Diuretic and Anti-Hypertensive Drugs Subject of March 28 Symposium at UOMS

The Council of the Oregon State Medical Society has approved an all-day postgraduate symposium on Diuretic and Anti-Hypertensive Drugs which will be held Friday, March 28, 1958, in the Auditorium at the University of Oregon Medical School, Portland.

A social hour and banquet will be held in the evening at the Hotel Multnomah. Guest speaker will be Robert Wilkins, Boston, Mass., who will present a paper on Diuretics in the Treatment of Hypertension.

The symposium is made possible by the financial assistance of Merck, Sharp and Dohme Laboratories.

PROGRAM

Physiology, Pathology and Pharmacology

Morning

Chairmen:
Frank Underwood and Hance Haney

9:00 Introductory Remarks: Ralph Benson, N. David
9:10 Renal Transport of Water — William D. Blake
9:40 Effect of Dichlorphenamide (Carbonic Anhydride Inhibitor) on Ocular Dynamics — John E. Harris
10:00 Pathogenesis of Toxemias of Pregnancy — Charles F. Montague
10:30 Intermission (coffee served in lobby)
10:45 Renal Transport of Electrolytes — Robert Pitts, New York
11:15 Mechanisms of Action of Chlorothiazide (Diuril) In Comparison With Other Diuretics — Karl Beyer, West Point, Pa.
12:00 Discussion and Questions (Panel of above speakers and chairmen)

Luncheon

12:30 University of Oregon Medical School Cafeteria
Program: Reports on Clinical Trials With Chlorothiazide
Moderator: Francis Chamberlain, San Francisco
Speakers: Homer Rush, William Galen and Melvin Breese

Clinical Management

Afternoon

Chairmen:
Homer Rush and Phillip Selling

2:00 Use of Chlorothiazide for Heart Failure, Nephrosis and Cirrhosis — John Laragh, New York
2:30 Control of Edema in Toxemia of Pregnancy — Nicholas Assali
3:00 Diuretic Treatment of Chronic Renal Disease — George Schreiner, Washington, D.C.
3:45 Use of Chlorothiazide in Management of Preeclampsia — Ralph Benson and George Hara
4:05 Clinical Trial of 'Diuril' as a Diuretic and Antihypertensive Agent — Norman A. David and W. Stanley Welborn
4:30 Discussion and Questions: Panel Moderators: John J. Murphy and Bernard Harpole

Banquet and Scientific Program

Evening

Place: Hotel Multnomah—*The Rose Bowl*

6:00 Cocktail Hour, Courtesy Merck, Sharp & Dohme
7:00 No-Host Banquet. Entertainment by The Forceps Four singing group.
8:00 *Address:* Diuretics in the Treatment of Hypertension — Robert Wilkins, Boston, Mass. (*Introduced by Homer Rush*)

OSMS Urges New Building for National Library of Medicine

A recent editorial in the *Journal of the American Medical Association* relating to ancient and inadequate facilities for the National Library of Medicine in Washington, D.C., has resulted in a resolution from the Oregon State Medical Society urging the United States Congress to provide funds for a new building.

The resolution, introduced by E. G. Chuinard of Portland at the February meeting of the Council, called attention to the *Journal* editorial appearing on page 1153 in the issue of November 2, 1957. The resolution points out that it . . . "is imperative to have modern facilities for the National Library of Medicine in order to properly serve medical education and the health in this nation."

Copies of the resolution were forwarded to Senators and Representatives from Oregon, the Librarian of the National Library of Medicine and the American Medical Association.

Union County Medical Society Elects

Newly elected officers of the Union County Medical Society are as follows: Donald Otten, president; Joseph Frederick, vice-president and Webster Ross, secretary-treasurer. All practice in La Grande.

Special Committee Named for Medicare

The Oregon State Medical Society looked ahead this month to October 31, 1958, when the current Medicare contract for Oregon with the U.S. Army will expire and authorized President Vern W. Miller to appoint a special committee to consider matters relating to the military dependent medical care program.

The Council voted that Russell H. Kaufman should serve as chairman of the three-member committee and also named him the Society's official representative to consider re-negotiation of the contract. Dr. Kaufman represented the Society at initial negotiations in 1956.

The committee was authorized to "handle all problems" relating to Medicare.

Mr. Joseph E. Harvey, Jr., general manager of Oregon Physicians' Service, the Society's fiscal agent for Medicare, reported that military authorities have indicated a desire to negotiate a new contract which would become effective immediately on expiration of the current agreement.

UOMS Applies for Federal Grant

University of Oregon Medical School has made application to the Federal Government for a grant to be used with state and gift money to erect a proposed Medical Research Building. The building, to be constructed on Marquam Hill in southwest Portland, would provide 110,750 square feet in a nine-story area initially with provision for later expansion to 14 stories. The structure is to be erected northeast of the teaching hospital and will connect the Outpatient Clinic, thus forming a quadrangle with the Clinic and with the Multnomah County Hospital.

From an annual figure of $17,500 in 1940-41, annual expenditure for research at the Medical School has risen to $713,500 in 1956-57.

Medical Advisors Named for Center

Eight physicians have been nominated by the Oregon State Medical Society to fill four three-year terms as members of the Medical Advisory Committee to the Portland Rehabilitation Center. Terms of office will expire on March 10, 1961.

New nominees are Forrest E. Rieke, Portland; Ralph Thompsen, Medford; Jules F. Bittner, Pendleton and Paul R. Vogt, The Dalles. Incumbents nominated were A. A. Enos and James H. Stewart, Salem, and Clinton S. McGill and Richard L. Sleeter, Portland.

Toledo Physician Honored

Matthew Gruber, 35-year-old Toledo physician, was honored recently as the town's most distinguished junior citizen for 1957 at an annual banquet sponsored by the Toledo Junior Chamber of Commerce.

Dr. Gruber is a 1950 graduate of the University of Minensota Medical School.

A committee of prominent citizens selected Dr. Gruber as recipient of the award.

Medical Board Licenses 14 Physicians

At a regular meeting of the State Board of Medical Examiners held in Portland January 16-18, licenses were issued to 14 physicians and surgeons to practice medicine and surgery in Oregon. Those receiving licenses are: *in Portland*—George Marion Austin, Robert Harry Bigley, Muriel Joan D. Hege, Frank Bushey Hege, Jr., William Wynne Hicks, Jr., Thomas Lynn Miller, Peter Paul Rowell, George Robert Satterwhite, and Jon Vidalin Straumfjord, Jr., M.D.; *other than Portland*—Fred Gin Chin, Parks Air Force Base, Calif.; Robert Jewett Fry, Corvallis; Thad Eugene Furlong, Salem; Anthony John Smith, Coos Bay; and Ernest August Wagner, National City, Calif.

The next regular meeting of the Board of Medical Examiners is set for April 10-12.

Lung Cancer Deaths To Be Studied

A few physicians in Oregon soon will be asked to cooperate with the U.S. Public Health Service in a limited survey of lung cancer deaths as part of a national study of the relationship of such deaths to smoking.

The request to study 39 deaths in Oregon was approved by the Council of the State Society on recommendation of the Committee on Cancer Study. C. Todd Jessell, chairman, reported the Committee unanimously recommended that the project be approved. The study will be conducted by the National Cancer Institute and the National Office of Vital Statistics assisted by the Oregon State Board of Health.

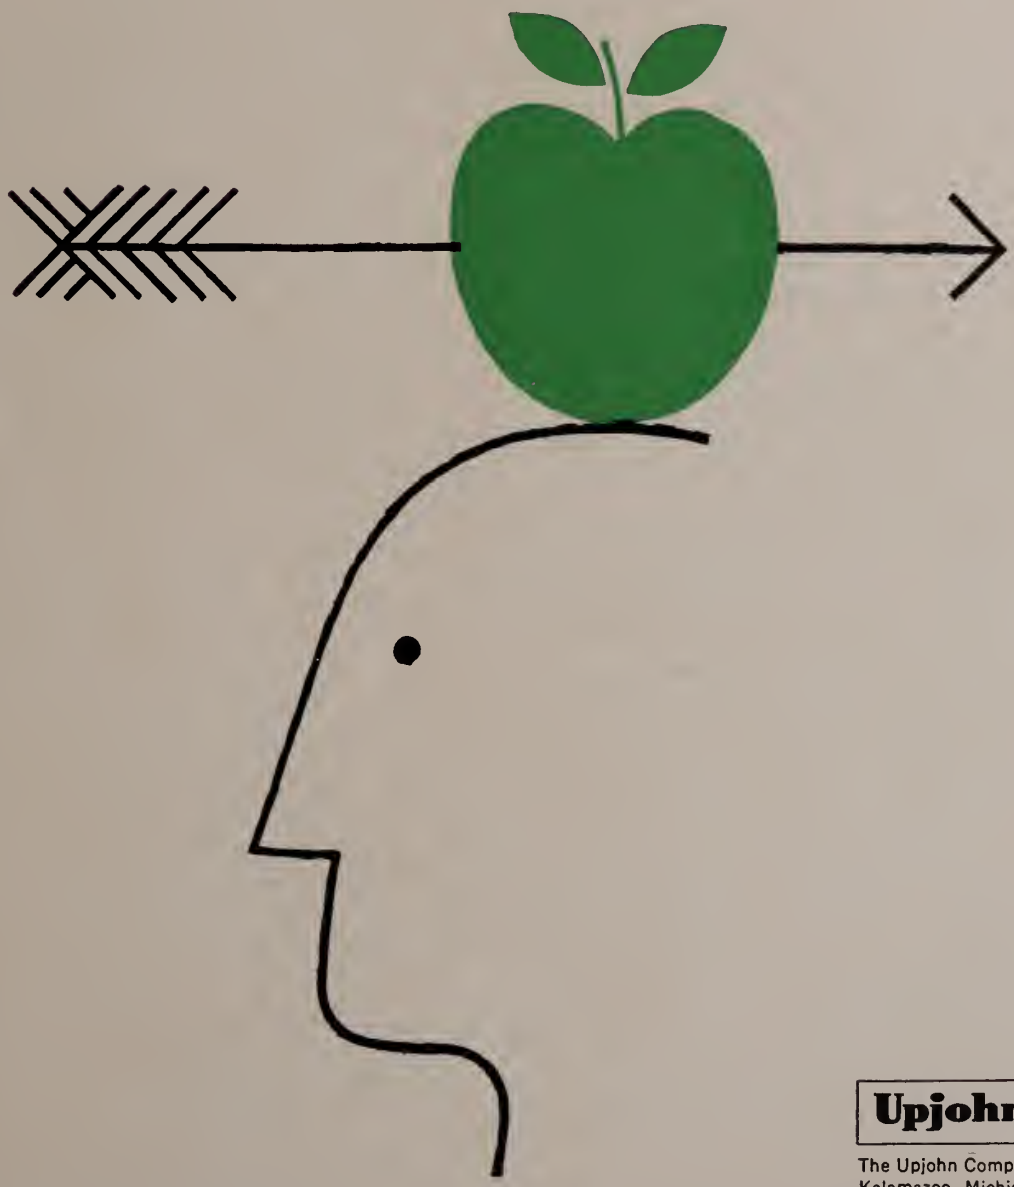
Retired Physicians Receive Memberships

One application for Life Membership and two requests for status as Active Member Emeritus were approved at the February meeting of the Council of the Oregon State Medical Society.

Life Membership was granted to Charles C. Newcastle, long-time Portland physician who recently retired from practice.

Recipients of Active Member Emeritus classifications were Bernard Barkwill of Coos Bay and F. Walter Brodie of Portland. Active Members Emeritus are physicians who have been active members in good standing for less than 30 years and who have retired.

Central Oregon Medical Society



At the January dinner meeting in Bend, members of Central Oregon Medical Society heard Frank Queen of Portland review progress in cancer research. Dr. Queen is professor of pathology at the University of Oregon Medical School.

Members from Prineville, Redmond, Bend and Madras attended the meeting. Harry E. Mackey of Bend presided in the absence of Max Hemingway, president, also of Bend.

For fast, complete treatment of vaginal infections

Problem is: she'll wait until discomfort is acute and then expect immediate relief. The answer is Trisert. Trisert preparations contain ALLANTOIN, an effective debriding agent which quickly dissolves heavy mucus often accompanying vaginal infections . . . METHYLBENZETHONIUM CHLORIDE, a quaternary germicide which removes unpleasant odors . . . SUCCINIC ACID, an aid in maintaining optimal vaginal pH . . . 9-AMINOACRIDINE HYDROCHLORIDE which has been included to supplement the bactericidal and trichomonacidal activity of other constituents. Treatment with Trisert Powder will control symptoms fast . . . usually within an hour . . . and provide effective initial treatment for 48 hours. After a second insufflation, the treatment is completed with at home use of Trisert Tablets which will generally bring the infection under complete control within 7 days.

Trisert

TRISERT TABLETS—Patient set, contoins bottle of 30 tablets ond special inserter. Bulk bottle of 100 tablets.

TRISERT POWDER—Availoble in 4 gr. individual treotment bottles. 12 to carton.

TRISERT POWDER INSUFFLATOR—Designed for use with Trisert Powder. Its use is urged for moximum efficiency.

William Horsfall of Coos Bay Dies

Dr. William Horsfall, known as Coos Bay's "grand old man of medicine," died in his sleep on the morning of January 17, 1958, at the age of 91.

Dr. Horsfall's long career of 64 years of service to his patients and community earned him a special place in the hearts of his fellow citizens. In 1952 he was honored by the State Medical Society and a special tribute was printed in the program for that annual meeting.

Dr. Horsfall was born in England on November 27, 1866. He was brought to the United States at the age of 4 by his parents, the Very Reverend Dean William and Sara Horsfall. He came to Coos Bay at the age of 20 in 1886, and received his degree from Cooper Medical College in San Francisco in 1892.

After receiving his degree, Dr. Horsfall returned to Coos Bay to begin the longest medical career ever pursued in any one community of Oregon.

An active participant in medical organization, he was twice President of Coos-Curry County Medical Society.

Even as a young practitioner, Dr. Horsfall was unusually courageous and resourceful. It is probable that the appendectomy he did on a kitchen table in a lonely cabin in the Coquille Valley in 1894 was the first successful operation for this condition performed in the Coos Bay region.

A lengthy editorial in the *Coos Bay World* last January 20, entitled "A Book Will Be Written . . ." quoted a colleague who said, "He kept up amazingly well and had a fantastic knowledge of the new methods and techniques. We of the medical profession hold a profound respect for Dr. Horsfall."

The editorial concluded, "The tribute that has been paid before to men of stature can be paid to Dr. Horsfall, that his community was a better place because he lived."

Albert Prill, Pioneer Scio Physician, Dies

Dr. Albert G. Prill, family physician in Scio for 54 years, died January 26, 1958, in an Albany hospital at the age of 88.

Dr. Prill was a Life Member of the Oregon State Medical Society and the American Medical Association. He carried on an active practice for 64 years.

Born on May 5, 1869, in Springfield, N. Y., Dr. Prill came to Oregon in 1890 after graduating the year before from the University of Vermont College of Medicine. Although a graduate in 1889, he was not awarded his M.D. degree until 1949, 60 years later. An illness prevented him from taking his final examinations.

As an ornithologist of national recognition, he donated several personal collections to universities, museums and libraries across the country. His exhibits are on display at the University of Oregon, Smithsonian Institute and Goldengate Park Museum in San Francisco.

Dr. Prill's contribution as a naturalist and lecturer won him recognition from the Oregon State Forestry Department when a lake in the Cascade range was named in his honor.

Civie activities were not overlooked during his long career. Dr. Prill was a former mayor and city health officer of Scio. He also served as a member of the school board for 18 years.

Multnomah County Medical Society Installs Officers for Current Year

Werner E. Zeller, Portland surgeon, assumed the presidency of Multnomah County Medical Society during the group's annual banquet in January. He succeeds Herman A. Dickel, president-elect of the State Society.

Arthur F. Hunter, clinical associate in the department of radiology at the University of Oregon Medical School, was named president-elect of the 800-member society.

Others installed in office were: Norman A. David, first vice-president; Charles E. Littlehales, second vice-president; Verner V. Lindgren, secretary, and Ivan I. Langley, treasurer. All are Portland physicians.

Board of Health Officers Named

Mr. Ralph Robertson, president of the Oregon State Board of Pharmacy, has been elected president of the State Board of Health. He succeeds N. E. Irvine of Lebanon. Carl Holm, Salem, was named vice-president and Leo Skelley, McMinnville, second vice-president. Harold M. Erickson was reappointed state health officer.

Clackamas County Medical Society

Holliser M. Stoltc has replaced L. Lloyd Smith as president of the Clackamas County Medical Socicty. Others named to offices were: Henry E. Schlegel, vice-president, and Daniel Billmeyer, secretary-treasurer. All are Oregon City physicians.

Jackson County Medical Association

Members of the Jackson County Medical Association met at Ashland in December to elect officers for 1958. Florian J. Shasky of Medford was elected to succeed to the presidency. Serving with him during the current year are Earl Lawson, Medford, secretary, and Ralph Thompson of Medford, treasurer, both holdover officers. Others elected to office were: Charles Lemery of Medford, historian; John Bradshaw of Ashland, member of the board of censors; and B. A. Cope of Ashland and B. Brandt Bartels of Medford, delegates.

Speaker at the meeting was James C. Luce, Medford, who had represented the Jackson County Medical Association at the national civil defense conference held in Chicago last fall.

Linn County Medical Society Elects

H. P. O'Neill of Albany was installed recently as president of the Linn County Medical Society, replacing C. W. Schoen, Lebanon. Other officers for the current year are: John Stanwood, Lebanon, vice-president; Robert Daugherty, Lebanon, secretary-treasurer and Ralph Wade, Albany, delegate.

Umatilla-Morrow County Society Elects

Louis J. Feves of Pendleton has been elected to the presidency of the Umatilla-Morrow County Medical Society. Dr. Feves succeeds J. Ralph McDonald, also of Pendleton.

Glucosamine . . . a physiologic absorption-enhancing agent

In the search for the ideal antibiotic-enhancement agent, Pfizer had three requirements to fill: (1) the adjuvant had to produce significantly higher antibiotic blood levels, (2) it had to achieve these higher blood levels consistently from patient to patient, (3) the adjuvant itself had to be perfectly safe to use.

Enhancement studies involving 84 adjuvants (including sorbitol, citric acid, sodium hexametaphosphate, and other organic acids and chelating agents, as well as phosphate complex and other analogs), and 30,000 blood level determinations revealed glucosamine as the enhancement agent of choice. Not only did glucosamine considerably increase antibiotic blood levels, but it produced these higher blood levels more consistently in crossover tests. And, importantly, glucosamine has no adverse effect in the human body.

Glucosamine is a normal physiologic metabolite that is found widely in the human body. Glucosamine does not irritate the gastrointestinal tract; it is sodium free and releases only four calories of energy per gram. Further, there is evidence that glucosamine may influence favorably the bacterial flora of the intestine.

ANNUAL MEETING
Spokane
September 14-17, 1958

President, Milo T. Harris, M.D., Spokane
Secretary, F. A. Tucker, M.D., Seattle
Executive Secretary, Mr. R. W. Neill, Seattle

CONFERENCE PERSONALITIES: Featured speakers and other personalities at the Second Biennial Conference for County Medical Society Officers are shown above. In top left photo are morning session speakers, from left: Mr. Warren Whyte, George M. Fister, W.S.M.A. President Milo T. Harris, Arnold J. Herrmann and Mr. Ralph W. Neill. Top right photo shows panel on working with press, radio and TV: Mr. Howard Cleavinger, Paul Rider, E. Harold Laws, Mr. Lincoln Miller and John R. Hogness. Bottom photos show head table at luncheon session, from left: Emmett L. Calhoun, W.S.M.A. president-elect; Mr. Whyte; James H. Berge, W.S.M.A. executive committee chairman; Raymond L. McKeown, luncheon speaker; Dr. Harris; Dr. Fister; F. A. Tucker, W.S.M.A. secretary-treasurer, and Dr. Laws.

Conference of County Society Officers Considers Problems Faced by Profession

Threats of government intervention in the practice of medicine and other problems facing the profession were considered at the Second Biennial Conference for County Medical Society Officers and Public Relations Chairmen in Seattle January 25.

The meeting, sponsored by the Washington State Medical Association, drew 84 registrants, including officers and staff members of the county societies and the State Association and guests. Twenty-one of the state's 26 county societies were represented.

President Milo T. Harris of Spokane opened the meeting and expressed hope it would strengthen liaison between the county societies and the State Association. He said the medical profession must have coordination and unity of purpose in order to meet the many challenges it faces.

George M. Fister of Ogden, Utah, member of the American Medical Association Board of Trustees and chairman of AMA Committee on Legislation, discussed national legislation, with particular reference to the Forand Bill, which is now before Congress. He emphasized that if the Forand Bill, or anything similar to it, were adopted by Congress, "we would be witnessing the longest and most direct step yet taken toward government medicine in America." He said the fundamental philosophy of the bill is "the same old, but rejuvenated principle that if the people will pay more taxes, then the various bureaus in Washington will . . . give to the people what they cannot provide for themselves."

Dr. Fister declared that "as the practice of medicine is our business, interest in legislation is our responsibility. The two are inseparable and if we wish to maintain what remains of the freedom of the private practice of medicine, with free choice of physician, it is mandatory that we give our best efforts to County, State and National legislative problems."

Also speaking on national legislation and the Forand

"PROOF IN PRACTICE"

a study of 12,880 hypertensive patients

No. of Patients	Results	Percent
3,929	excellent	30.5%
6,393	good	49.6%
1,535	fair	11.9%
596	unsatisfactory	4.6%
427	side effects	3.3%

The tabulations at the left are from the recently completed study on cryptenamine (Unitensen) in which 12,880 patients and 1,384 physicians participated. Evaluation of the drug was based on experience in everyday private practice.

A summary of the "proof in practice" study is available upon request from the Medical Director of Irwin, Neisler & Co.

UNITENSEN®

Each Unitensen tablet contains cryptenamine (tannates) 2.0 mg.

UNITENSEN-R®

Each Unitensen-R tablet contains cryptenamine (tannates) 1.0 mg., Reserpine 0.1 mg.

Clinical supplies available upon request.

Neisler

Irwin, Neisler & Co. • Decatur, Illinois

(Continued from page 365)

Bill was Mr. Warren Whyte of Chicago, executive secretary of AMA Committee on Legislation. He described the bill as "socialized medicine, pure and simple," and emphasized that the medical profession cannot afford to lose the fight against it. He advised medical societies to inform their members on the Forand Bill and its dangers, and to communicate their views to their congressmen.

Mr. Ralph W. Neill, executive secretary of the Washington State Medical Association, urged county society officers to keep abreast of national and state legislative developments, and be ready to act when called upon. He also asked that the WSMA Central Office be kept informed on local developments.

Raymond M. McKeown of Coos Bay, Oregon, member of AMA Board of Trustees, addressed the luncheon session on "The Challenge to Prepaid Plans." He said the rapid spread of prepaid medical care in America has been phenomenal. "Today they are providing the American people with the best medical care in the world," he declared.

"Three great issues may be said to face the plans today," said Dr. McKeown. "If these issues are solved satisfactorily, the years ahead look bright indeed for prepaid medicine. But if the plans cannot or will not solve them, it could well mark the beginning of their decline from the American scene.

"The three great issues before the plans are: First, to establish a satisfactory means of providing economically sound total medical coverage; second, to develop medical coverage for those not ordinarily covered now; and third, to develop a satisfactory approach towards accepting or rejecting existing closed panel prepaid medical coverage plans which so closely resemble the old contract practice of medicine. If able to solve these three fundamental challenges, the plans may look with great optimism to the future, indeed."

The afternoon session featured a panel discussion on Working with Press, Radio and Television. E. Harold Laws, chaiman of WSMA Public Relations Committee, was moderator. Members of the panel were Mr. Howard C. Cleavinger, managing editor of the *Spokane Chronicle;* Paul Rider, chairman of the Yakima County Medical Society Public Relations Committee; Mr. Lincoln Miller, vice-president of Station KIRO, Seattle, and John Hogness, chairman of the King County Medical Society Public Relations Committee.

Donald T. Hall, M.D.

Also included in the afternoon program were an address by Donald T. Hall of Seattle on WSMA Medical Defense Fund, of which he is chairman, and a discussion of public relations projects and materials by Mr. Vern Vixie, WSMA Public Relations Director.

In the final session, which was conducted as a general forum, the principal subject considered was the Medical Disciplinary Act. James H. Berge of Seattle, chairman of the Medical Disciplinary Board, discussed the jurisdiction of the Board and the administration of the law.

F. M. Graham, M.D.

The conference was planned and directed by the WSMA Public Relations Committee, with the assistance of the Central Office staff. Acting as session chairmen were two members of the Committee, Arnold J. Herrmann of Tacoma and F. M. Graham of Bellingham.

Copies of the papers and proceedings of the meeting will be distributed to the conference registrants, as well as other interested physicians.

Spokane Society of Internal Medicine To Meet in Annual Session April 11

Annual meeting of the Spokane Society of Internal Medicine will be held April 11 in the Isabella Room of the Davenport Hotel. Papers will be presented from 9 in the morning until 5:30 P.M., followed by social hour at 6:30 P.M. and evening banquet at 7:30 P.M.

Guest speakers for the annual session are Thomas Carlile of Seattle and Donald M. Pitcairn of Portland. Dr. Carlile will speak on radioactive isotopes in the treatment of benign and malignant disease. Dr. Pitcairn will discuss pulmonary disease.

Several Spokane physicians also will present papers. They are: Arthur B. Petersen, Loren A. Gothberg, Robert A. Stier and Samuel K. McIlvanie.

Robert Picken of Opportunity is program chairman and Roy Biehm, Spokane, is in charge of arrangements. Those who plan to be at the meeting are asked to make their own hotel reservations.

All physicians are invited to attend the one-day session and it is suggested that the opportunity be taken also to attend the annual meeting of the Spokane Surgical Society which is to be held the following day, also in the Davenport Hotel.

Spokane Surgical Society To Hold Annual Meeting on April 12

Spokane Surgical Society members will meet April 12 at the Davenport Hotel for their annual session. Guest speaker will be George Pack, clinical professor of surgery at New York Medical College and associate professor of clinical surgery at Cornell University Medical College.

Dr. Pack will speak on three subjects: 30 Years Experience in Management of Carcinoma of the Stomach, Surgical Attack on Tumors of the Liver, and Sarcoma of the Soft Tissues. In addition, several papers are scheduled to be given by members of the Society.

Ralph Berg, Jr., is chairman of the program committee.

Riverton Hospital Expands Services

At the beginning of the year, Riverton Hospital in Seattle, the oldest tuberculosis sanatorium in the Pacific Northwest, began accepting patients with other chronic and acute diseases. The Hospital will continue to specialize in the care of patients with pulmonary diseases and at the same time will provide general hospital care with certain limitations.

Heart Association Names Seattle Physician Chairman of Rehabilitation Committee

Donal Sparkman, Seattle cardiologist, has been named chairman of the American Heart Association Rehabilitation Committee.

The national Rehabilitation Committee includes nationally known physicians specializing in problems of the cardiac worker, labor and industrial leaders and heads of government agencies concerned in the problem. The new chairman met with the committee in New York February 14.

Dr. Sparkman has been a member of the AHA Rehabilitation Committee since its organization in 1954. He is chairman of the Washington State Heart Association's Rehabilitation Committee and is also Medical Director of the Association's Cardiac Work Evaluation Clinic, a service which assists in solving the work problems of heart patients.

Additional Committee Appointments Noted

Two committee chairmen have been appointed by the Washington State Medical Association Board of Trustees to fill vacancies due to resignations. Eric Sanderson of Seattle was placed on the Medical Economics Committee for a three-year term, and R. P. Moore of Port Angeles will head the Publication Committee for a one-year term.

President Milo T. Harris has named two additional members to the Civil Disaster Committee. They are Peter T. Brooks of Walla Walla and Richard B. Link of Tacoma.

Spokane Academy of General Practice

Ninth annual meeting of the Spokane Academy of General Practice drew an attendance of more than 120 general practitioners from Montana, Idaho, Washington and British Columbia. The session was held early in December at the Spokane Hotel.

Robert W. Kistner and Charles L. Easterday, both faculty members of Harvard Medical School, were guest speakers. They conducted a symposium on obstetrics and gynecology during the day, and then spoke at the evening banquet.

Research Fellowship Awarded

John Morledge, research fellow in cardiology at the University of Washington School of Medicine, has been awarded a research fellowship provided by the South Central Alaska Heart Association. The fellowship, which becomes effective September 1 of this year, will enable Dr. Morledge to continue his studies in clinical cardiology under the direction of Robert A. Bruce.

Southwest Washington Academy of GP

Southwest Washington Academy of General Practice quarterly meeting was held at the Longview Country Club January 28. Following dinner and social hour, John Benward, pediatrician from Portland, spoke on Latest Developments in Pediatrics. Annual Meeting and election of officers is scheduled for March 19 at the Royal Oaks Country Club.

Seattle Academy of Surgery Elects

At the January meeting of the Seattle Academy of Surgery, members elected the following officers for 1958: Lawrence M. Penny, president; W. N. Moray Girling, vice-president; Donald D. Corlett, secretary, and E. H. Torkelson, treasurer.

Speaker at the dinner meeting was Clarence Olson, Seattle chest surgeon. Dr. Olson spoke on surgical emergencies occurring with chest injuries. His discussion stressed complications arising as a result of automobile and industrial accidents to the thoracic cage.

The academy has scheduled its next meeting for March 21 at the Washington Athletic Club.

County Health Officer Resigns

Lucien J. Coquet, Skagit County health officer since March, 1956, resigned his post effective the last of January. Dr. Coquet has entered full-time private practice in Burlington.

Spokane Pharmacies Support Scholarships

University of Washington School of Medicine recently received $1,000 from four Spokane pharmacies to support two annual $500 scholarships for promising medical students from the Inland Empire area. The check was presented by J. B. Phinney, secretary of the Spokane County Medical Society.

Participating pharmacies are Cowen's, Hart and Dilatush, Miller and Felt, and Whitlock's. This is the fourth year they have offered the scholarships. Winners for the coming year will be announced by the school at Medical Honors Day ceremonies in May.

Mosquito Control District Formed

In accordance with a referendum which approved the forming of a Mosquito Control District for Adams County, an organizational meeting was held recently in Lind. J. Colin Lindsay of Ritzville was appointed physician for the county at large. The tax levy which would have implemented the group's operations, however, lost due to the fact that too few Adams County residents voted to legalize the election.

UWMS Receives Grant from USPHS

A grant of $5,200 from the U.S. Public Health Service was recently awarded to the department of obstetrics and gynecology at the University of Washington School of Medicine for the study of aldosteronuria and its mechanisms during normal and toxemic pregnancy.

LABORATORIES INC. Portland 1, Oregon

13th Naval District Sets Billing Instructions For Medical Care of Active Duty Personnel

In accordance with a directive from the Secretary of the Navy to the Chief of the Bureau of Medicine and Surgery, authority has been delegated to respective District Medical Officers to adjudicate and approve all claims of expenses for medical care furnished Naval and Marine Corps personnel by civilian non-Federal sources located within the geographic confines of the district.

Billing instructions as set down for the Thirteenth Naval District, which includes the states of Washington, Oregon, Idaho and Montana, are as follows:

HEADQUARTERS THIRTEENTH NAVAL DISTRICT
DISTRICT MEDICAL OFFICE
SEATTLE 15, WASHINGTON

When the situation does not permit obtaining treatment from Federal facilities, necessary treatment may be obtained from civilian sources by or on behalf of members of the Naval Service, and REASONABLE expenses therefor may be allowed as a charge against the Navy. The expense of ELECTIVE medical or surgical treatment from civilian sources may be allowed under NO circumstances. Elective medical and surgical treatment is defined as medical or surgical care that is desired or requested by the patient which, in the opinion of cognizant medical authority is not medically indicated, e.g., surgery solely for cosmetic purposes.

The unpaid bill for medical treatment or hospitalization should be prepared in sextuplicate and addressed to:

Commandant (Code 46)
THIRTEENTH Naval District
Seattle 15, Washington

The bill should be itemized to show:

1. Full name, rate or rank, and serial number of the patient.
2. Services rendered and supplies furnished.
3. Date or dates on or between which services were rendered.
4. Nature of and charge for each item.

When a bill is signed or receipted in the name of a physician or hospital, the name of the person writing the physician or hospital's name, as well as the capacity in which he signs, must appear. EXAMPLE: "John Doe, M.D. per Jane Smith, Secretary" or "Sacred Heart Hospital per John Smith, Administrator" or as the case may be. Six additional signed or receipted bills must be submitted for services of each special nurse, anesthetists, or other persons on a fee basis, unless the bill including such services is accompanied by the above required number of receipts to show that the expenses have been defrayed by the physician, hospital or firm submitting the bill, or by a statement to the effect that the individual is a full-time employee of the payee.

History of Medicine Discussed at Gonzaga

Robert P. Parker, Spokane internist, recently lectured on History of American Medicine at Gonzaga University. Dr. Parker traced the main events in the history of medicine from the earliest days of the nation up to the present time. He summarized with what he believed to be the future of medicine. Question and answer period followed the formal presentation.

UWMS To Present Postgraduate Course on Edema and Hypertension March 29

A postgraduate course on Pathogenesis and Treatment of Edema and Hypertension will be presented in the Health Sciences Building Auditorium of the University of Washington School of Medicine, Saturday, March 29. Attendance is open to all physicians and no tuition fee will be charged.

Recent advances in the understanding of mechanisms of edema formation will be discussed, and reviews of clinical experience and investigation of new methods of treatment will be presented.

Medical School faculty members who will participate in the program are: Earl P. Benditt, professor and executive officer of pathology; Russell R. de Alvarez, professor and executive officer of obstetrics and gynecology; John H. Luft, instructor and senior fellow in anatomy, and Robert F. Rushmer, professor of physiology and biophysics.

The following guest speakers also will present papers: John H. Laragh, instructor in medicine, Columbia University College of Physicians and Surgeons, New York; Robert R. Pitts, professor and chairman of physiology, Cornell University Medical College, New York; George E. Schreiner, assistant professor of medicine, Georgetown University School of Medicine, Washington, D. C., and Robert W. Wilkins, professor of medicine, Boston University School of Medicine, Boston.

State Heart Association Sponsors Low Sodium Diet Classes

First of the new series of Low Sodium Diet Classes sponsored by Washington State Heart Association was presented last month in Longview. The classes are open to patients whose physicians have prescribed such a diet, to members of the patients' families involved in preparation of food, to professional personnel in the field of nutrition and to expectant mothers whose physicians have prescribed a low-sodium diet.

This new community service program was organized at the request of many physicians throughout the state. The course of study was prepared by the Heart Association's committee on nutrition in line with the results of a pilot study conducted last September in Yakima to determine what type of classes would best serve the patients.

Instructions are given by dieticians, and physicians are in attendance to answer medical questions.

Classes in King County are expected to be scheduled in April. Any county medical society which is interested in having these classes made available to their community should contact: Washington State Heart Association, 3121 Arcade Bldg., Seattle 1.

Physicians Buy Skagit Laboratory

A corporation composed of Skagit County physicians has purchased the Skagit County Clinical Laboratory and Blood Bank of Mount Vernon. Don Hammond of Mount Vernon is president of the new corporation. Other officers are Robert Hunter, Sedro Woolley, vice-president, and J. Walfred Wallen, Burlington, secretary-treasurer. According to the new owners, the laboratory will continue in its procedure of making blood available to all hospitals in Skagit County without interruption.

YOU CAN SEE THEM RESPOND TO "TOTAL EFFECT" NUTRITIONAL SUPPORT

GEVRAL®-T

HIGH POTENCY VITAMIN AND MINERAL SUPPLEMENT LEDERLE

CAPSULES

For a really rapid response in debilitated patients, prescribe new GEVRAL T, the unique *"total effect"* nutritional supplement. Actually *six nutritive formulas in one,* each high potency GEVRAL T Capsule includes:

A COMPLETE, HEMATINIC SUPPLEMENT . . . including non-inhibitory intrinsic factor for enhanced B_{12} absorption, plus Folic Acid, Vitamin C, and Iron.

ALL THE FAT-SOLUBLE VITAMINS . . . including Vitamin K . . . in ample amounts.

A COMPLETE B-COMPLEX COMPONENT . . . in high dosage quantities.

AMINO ACID SUPPLEMENT, l-Lysine . . . for fuller utilization of ingested protein.

LIPOTROPIC FACTORS, CHOLINE AND INOSITOL

12 IMPORTANT MINERALS AND TRACE ELEMENTS

Your patients get even more nutritional support for their money with economical GEVRAL T . . . *supplied in an attractive, on-the-table jar.*

Each capsule contains:

Vitamin A	25,000 U.S.P. Units
Vitamin D	1,000 U.S.P. Units
Vitamin B_{12}	5 mcgm.
Thiamine Mononitrate (B_1)	10 mg.
Riboflavin (B_2)	10 mg.
Pyridoxine HCl (B_6)	2 mg.
Vitamin E (as tocopheryl acetates)	5 I. U.
Vitamin K (Menadione)	2 mg.
Ascorbic Acid (C)	150 mg.
Calcium Pantothenate	5 mg.
Niacinamide	100 mg.
Folic Acid	1 mg.
Calcium (as $CaHPO_4$)	107 mg.
Phosphorus (as $CaHPO_4$)	82 mg.
Iron (as $FeSO_4$)	15 mg.
Magnesium (as MgO)	6 mg.
Potassium (as K_2SO_4)	5 mg.
Iodine (as KI)	0.15 mg.
Boron (as $Na_2B_4O_7 \cdot 10H_2O$)	0.1 mg.
Copper (as CuO)	1 mg.
Manganese (as MnO_2)	1 mg.
Fluorine (as CaF_2)	0.1 mg.
Zinc (as ZnO)	1.5 mg.
Molybdenum (as $Na_2MoO_4 \cdot 2H_2O$)	0.2 mg.
Choline Bitartrate	25 mg.
Inositol	25 mg.
l-Lysine Monohydrochloride	25 mg.
Rutin	25 mg.
Purified Intrinsic Factor Concentrate	0.5 mg.

DOSAGE: 1 capsule daily for the treatment of vitamin and mineral deficiencies, or more as indicated.

SUPPLIED: Bottles of 100 capsules.

Heart Association Endows Chair For Cardiovascular Research at UWSM

Washington State Heart Association recently announced the endowment of a permanent Chair for Cardiovascular Research at the University of Washington School of Medicine. It is the first endowed Chair at the institution.

Under terms of the endowment, the Association will grant $15,000 annually to the Medical School for the continued support of an outstanding research investigator. Any funds remaining over the investigator's salary may be used as a grant for his research requirements, such as technical assistants, laboratory equipment and supplies. The investigator also will be eligible to apply to the Association for additional funds if needed to support his work.

Selection of the investigator to occupy the Chair will be made by the University School of Medicine and the Heart Association. It will be a permanent appointment with the researcher being subject only to the University tenure system. He will become a full-time faculty member of the Medical School with a standing of assistant professor or higher grade and will have qualities which are believed to eventually make him eligible for full professorship. The appointment is expected to be made this spring.

Endowment of the Chair differs from previous Heart Association research grants in that this endowment supports the man as well as his work, leaving him free to spend almost his full time in research unhampered by teaching and administration duties. Currently the Washington State Heart Association is supporting 15 investigations to discover causes and means of control of heart and blood vessel ailments.

Spokane County Medical Society

J. C. Hathaway has assumed the presidency of the Spokane County Medical Society, succeeding G. Clifford Smith. Those elected to office are: Clarence L. Lyon, president-elect; Joseph B. Finney, secretary; Robert F. Welty, treasurer; John R. Cole and A. T. Perry, trustees; and D. G. Corbett, censor. Delegates are: Dr. Hathaway, Dr. Lyon, Dr. Smith, A. O. Adams, George H. Anderson, Fred C. Harvey and Robert E. Jensen. Alternate delegates are: John C. Ely, M. M. Kalez, Eric R. Paulson, H. T. Pederson, Leon E. Pollock, G. E. Sanford and W. H. Tousey. All are Spokane physicians except Dr. Ely who practices in Opportunity.

Pierce County Medical Society

Herman S. Judd has been elected to head the Pierce County Medical Society during the present year. Others in top posts are: J. W. Bowen, Jr., president-elect for 1959; Chris C. Reynolds, vice-president, and Arnold J. Herrmann, secretary-treasurer. All practice in Tacoma.

Grant County Medical Society Elects

Officers of the Grant County Medical Society for 1958 are R. M. Gill, Moses Lake, president and Wayne Piper of Ephrata, secretary-treasurer. Anson F. Hughes of Moses Lake was named president-elect.

Physician Wins Civic Award

Wendell Kirkpatrick, Longview general practitioner, recently was presented with the Longview Junior Chamber of Commerce Distinguished Service Award for community service during 1957. Dr. Kirkpatrick has practiced in Longview since 1953. He is a member of the Longview school board, Rotary Club, Longview Music Society and the World Neighbors. He has been active in the Community Church and has served as president of Cowlitz-Wahkiakum Medical Society. He has been chairman of the Diabetes Detection Campaign, a member of the speakers bureau for the Heart Association and also has assisted with the Red Cross Bloodmobile program.

Location

J. A. Severson has opened offices in Bremerton for the practice of obstetrics and gynecology. Dr. Severson received his medical degree in 1953 from the University of Washington School of Medicine. He served his internship at Pierce County Hospital in Tacoma and then took three years of specialty training at Emanuel Hospital in Portland. In July 1957 he opened offices in John Day, Oregon, while waiting for an opening in Bremerton. Dr. Severson owned a livestock farm and served four years in the U.S. Coast Guard before taking up the study of medicine.

Obituaries

Dr. Olav Johan Fortun of Seattle, 83, died December 8 of cardiac failure due to coronary thrombosis. Dr. Fortun was graduated in 1910 from Chicago College of Medicine and Surgery. He had practiced in Mayvill and Grand Forks, N.D., and Everett before locating in Seattle.

Dr. J. Robert Morrow of Seattle, 68, died December 9 of a cerebral hemorrhage due to cerebral arteriosclerosis. Dr. Morrow retired in 1953 from the United States Public Health Sevice Hospital, Seattle, where he was a consulting eye specialist. He received his medical degree from Jefferson Medical College of Philadelphia in 1914. In 1931 he located in Seattle and had a private practice for several years before entering the Public Health Service.

Dr. Frederick A. McMurray, 65, retired Vahson Island physician, died December 16 of metastatic carcinomatosis due to carcinoma of the right kidney. Dr. McMurray attended Rush Medical College, Chicago, from which he was graduated in 1920. He took his internship at the Norwegian Hospital in New York city and was the first intern to serve at Children's Orthopedic Hospital, Seattle. Dr. McMurray, who began practicing on Vashon in August 1921, spent 36 years serving the Island community.

Dr. Harvey J. Felch, 92, pioneer Ellensburg physician, died December 24 in Des Moines, Wash., of an acute myocardial infarction. Dr. Felch was graduated in 1900 from Kansas City Medical College and located in Ellensburg that same year. He practiced in the Eastern Washington community until his retirement in 1930, at which time he moved to Vashon Island.

Idaho

IDAHO STATE MEDICAL ASSOCIATION
364 Sonna Bldg.
Boise, Idaho

SIXTY-SIXTH ANNUAL MEETING
July 6-9, 1958
Sun Valley

President, H. B. Waalley, M.D., Idaho Falls Secretary, W. B. Rass, M.D., Nampa Exec. Secy., Mr. A. L. Bird, 364 Sonna Bldg., Boise

T. O. Carver of Boise Appointed State Health Administrator

Terrell O. Carver, Boise, assumed his duties as State Health Administrator under the State Board of Health on February 1. Dr. Carver fills a position that has been vacant since the new Board of Health was appointed by Governor Robert E. Smylie last year.

A graduate of the University of Oregon School of Medicine, 1945, Dr. Carver interned at the U.S. Marine Hospital, San Francisco, and obtained his master's degree in Public Health from Tulane University, New Orleans, 1949. He has been licensed to practice in Idaho since 1949 and is an active member of Southwestern Idaho District Medical Society, Idaho State Medical Association, and American Medical Association.

Selecting a career in Public Health, Dr. Carver has served in a number of capacities. Prior to coming to Idaho, he was Louisiana State Tuberculosis Control Officer. He served as Director of Preventive Medicine, Idaho Department of Public Health, and for the past several years has been Director of the City-County Health Department, Boise, and Director of Health Program, Boise City Schools.

In his new position, Dr. Carver will also serve as Secretary to the State Board of Health and will be in charge of all Public Health activities in Idaho. Serving under him will be the Director of Public Health, and the Director of Mental Health.

Dr. Carver's appointment to the No. 1 Public Health post in Idaho was announced by Paul M. Ellis of Wallace, Chairman of the State Board of Health.

Idaho Physicians at Seattle Meeting

The Pacific Northwest Regional Meeting of the American College of Physicians, held in Seattle January 17, was attended by five Idaho physicians. Papers were given at the session by Charles C. Johnson and Maurice M. Burkholder, both of Boise. Richard P. Howard, Pocatello, was scheduled to present a paper, but was unable to attend. Other Idaho physicians who attended included S. M. Poindexter, Frank W. Crowe and William D. Forney, all of Boise.

Northwest Medicine Trustees Meet in Seattle

Annual meeting of the Trustees of NORTHWEST MEDICINE held in Seattle, January 24-25 was attended by Idaho Trustees Melvin M. Graves, Pocatello; J. B. Marcusen, Nampa, and William T. Wood, Coeur d'Alene.

State Officers and Councilors Hold First Meeting of 1958

First meeting of Association Officers and Councilors for 1958 was held in Boise January 11. Many important matters were considered, among them:

1. Approved renewal of the Medicare Contract and Fee Schedule for the period March 1, 1958 to February 28, 1959; designated Richard D. Simonton, Boise, as Chief Medicare Negotiator.
2. Approved employment of an attorney.
3. Approved plans to visit the ten component medical societies during March, April and May.
4. Reviewed and approved plans for the 66th Annual Meeting of the Association, Sun Valley, July 6-9, 1958.
5. Heard a report of the AMA meeting in Philadelphia, December 2-6.
6. Acting as the Medicare Board of Review, adjusted several Medicare claims.

Officers attending the session included President Hoyt B. Woolley, Idaho Falls; President-Elect Donald K. Worden, Lewiston; Past-President Charles A. Terhune, Burley; Secretary-Treasurer W. B. Ross, Nampa; AMA Delegate Raymond L. White, Boise; Councilors Robert E. Staley, Kellogg; F. Wayne Schow, Twin Falls, and Asael Tall, Rigby.

Guest Speakers Accept Invitations To Present Papers at 66th Annual Session

Scientific Program for the 66th Annual Meeting of the Idaho State Medical Association is now complete. Fred E. Wallber of Idaho Falls, program chairman, reports the following have accepted invitations to be guest speakers at the session:

Carl A. Moyer, St. Louis, Professor of Surgery, George Washington University School of Medicine.

Ralph C. Benson, Portland, Professor of Obstetrics and Gynecology, University of Oregon School of Medicine.

C. Donald Creevy, Minneapolis, Professor of Urology, University of Minnesota School of Medicine.

H. Corwin Hinshaw, San Francisco, Clinical Professor of Medicine (Diseases of the Chest), Stanford University School of Medicine.

Don H. O'Donoghue, Oklahoma City, Professor of Orthopedics, University of Oklahoma School of Medicine.

Subjects of the papers that will be presented during the 66th Annual Meeting of the State Association will be announced later.

Former Northwest Medicine Trustee Walter R. West Succumbs

Dr. Walter R. West, 62, Idaho Falls, who served as President of the Idaho State Medical Association, 1950-51, died January 2 in a Salt Lake City Hospital of carcinoma of the antrum.

Walter R. West, M.D.

Dr. West attended the University of Utah School of Medicine for two years and received his degree from the University of Cincinnati College of Medicine in 1925.

Long active in state and community affairs, Dr. West served organized medicine in a number of capacities including that of Trustee to NORTHWEST MEDICINE from 1952 through 1954, Bonneville County Health Officer, President of the staff of the Idaho Falls LDS Hospital, Councilor of Idaho State Medical Association, member of the Medical Education Committee, Civilian Defense Committee, and History and Necrology Committee.

Dr. West was an active member of the Idaho Falls Medical Society, Idaho State Medical Association, American Medical Association, International College of Surgeons, and American Academy of General Practice. He was also a member of the Board of Directors of the Idaho Hospital Service (Blue Cross), Idaho Falls Chamber of Commerce, Bonneville Chapter of the American Red Cross, and had served as President of the Idaho Falls Lions Club.

Obituary

Dr. Lester L. Shupe, 50, Caldwell surgeon, died suddenly December 7 in a local hospital following a heart attack. He was president of the Southwestern Idaho Medical Society at the time of his death. Dr. Shupe was graduated from Western Reserve University School of Medicine in 1932 and took his surgical residency at St. Vincent's Hospital, Cleveland, Ohio. He practiced at Fairbury, Neb., until entering the U.S. Army in April, 1941. Dr. Shupe was discharged from the service with the rank of Lieutenant Colonel in September 1945, at which time he located in Caldwell.

Location

William C. Mannschreck, who left Idaho last November to practice in California, returned to Lewiston in January to reopen his office for the practice of pediatrics.

Southwestern Idaho Society Elects

Newly elected officers for Southwestern Idaho District Medical Society for the coming year are:

President, Ralph R. Jones of Boise; Vce-President, George E. Davis of New Plymouth; Secretary, Glenn Talboy of Boise (re-elected); Treasurer, Vaun T. Floyd of Boise; Council Member, John F. Moser of Cascade.

Medical Planning Committee Meets

The Association's Medical Planning Committee, of which Charles A. Terhune, Burley, is chairman, met in Boise, February 8. A number of important matters were considered by this committee, made up of the following members: E. V. Simison, Pocatello; Donald K. Worden, Lewiston; Raymond L. White, Boise; Russell T. Scott, Lewiston, and Alfred M. Popma, Boise.

Officers Named for Rehabilitation Center

New officers of the Medical Staff for the Idaho Elks Rehabilitation Center, Boise, for the coming year will be:

President, Maurice M. Burkholder of Boise; Vice-President, William R. Tregoing of Boise; Secretary-Treasurer, Frank Crowe of Boise; Executive Committee Members, Manley B. Shaw and James J. Coughlin of Boise.

Idaho Ob-Gyn Specialists Elect Officers

New officers of the Idaho Obstetrical and Gynecological Society for the coming year are:

President, E. R. W. Fox of Coeur d'Alene; President-Elect, James C. F. Chapman of Boise; Secretary-Treasurr, Ervin S. Bills of Idaho Falls; Directors, Fen H. Covington of Twin Falls, and Ralph B. Hegsted of Pocatello.

State Chairman Attends AMEF Meet in Chicago

Jerome K. Burton, Boise, Chairman of the Association's American Medical Education Foundation Committee, attended a one-day national session of AMEF Chairmen in Chicago, January 26. Mrs. Hoyt B. Woolley, Idaho Falls, President of the Woman's Auxiliary to the Idaho State Medical Association, also attended the conference.

South Central Idaho Society Elects

New officers for South Central Idaho District Medical Society for the coming year are:

President, Bernard L. Kreilkamp of Twin Falls; President-Elect, Paul F. Heuston of Twin Falls; Secretary-Treasurer, Fred T. Kolouch of Twin Falls.

North Idaho Medical Society Elects

Eugene J. Baldeck of Lewiston has been elected president of the North Idaho Medical Society to succeed John Ayers of Moscow. Edward N. Dunn of Moscow was named to the office of vice-president and Lester C. Crismon of Lewiston was elected secretary.

Clyde Culp Enters Fellowship at Mayo

Clyde E. Culp, who practiced in Moscow since October 1, 1944, and who has served on the State Board of Medicine since 1954, enters a four year fellowship in proctology at the Mayo Clinic, Rochester, Minnesota, on April 1. Dr. Culp resigned from the Board of Medicine February 1.

State Board of Medicine

The regular meeting of the State Board of Medicine was held in Boise, January 13, 14, 15, 1958. Members of the Board attending the session included S. M. Poindexter, Boise, Chairman; W. B. Ross, Nampa, Vice-Chairman; Paul M. Ellis, Wallace; Clyde E. Culp, Moscow; Leland K. Krantz, Idaho Falls, and Fred T. Kolouch, Twin Falls.

During the meeting, two physicians wrote the examination and received passing grades and will be granted licenses upon completion of their internship. They were:

Doyle Barrett, Ogden, Utah. Graduate University of Utah Medical School, M.D. Degree, 1957. Internship now serving, Thomas Dee Memorial, Ogden.

Richard R. Kendrick, Ogden, Utah. Graduate University of Utah Medical School. M.D. Degree, 1957. Internship now serving, St. Benedict's Hospital, Ogden.

Permanent licenses were granted to the following physicians who received Temporary Licenses during the past six months:

Herbert A. Hartfield, Moscow, Graduate University of Louisville Medical School, Louisville, Kentucky. M.D. Degree, June 1928. Internship, St. Joseph's Infirmary, Louisville, Kentucky, 1928 to 1929. Granted TL-194 July 12, 1957. Granted Permanent License M-2380 on the basis of Kentucky written examination. School Health.

Roosevelt W. Kite, Sunnyside, Washington. Graduate University of Arkansas Medical School, Little Rock. M.D. Degree, June 1933. Internship Pulaski County Hospital, Little Rock, 1931 to 1933. Granted TL-199 November 4, 1957. Granted Permanent License M-2381 on the basis of Washington written examination. General.

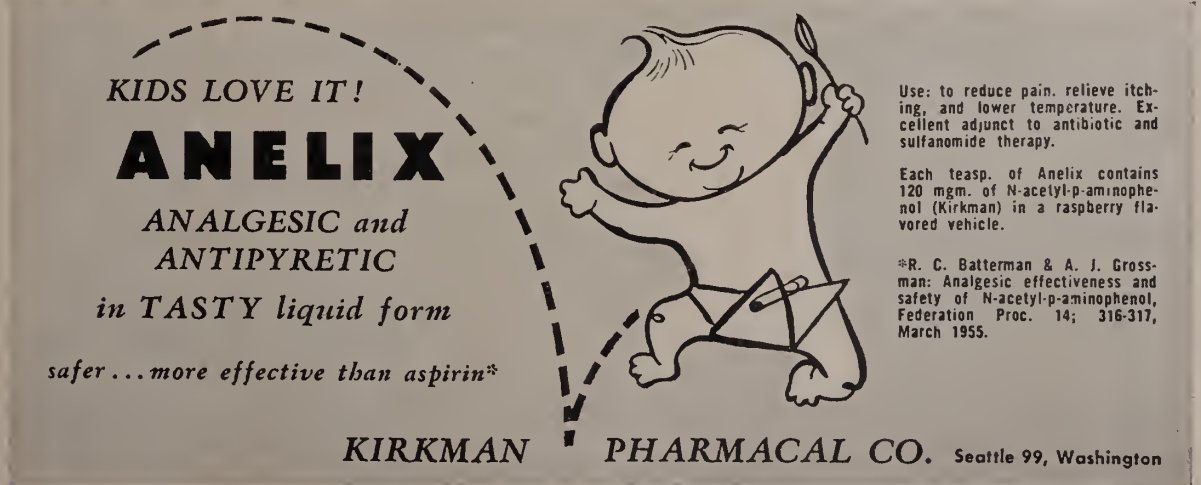
Robert H. Wilkinson, Boise. Graduate Cornell University Medical College, New York. M.D. Degree, June 1951. Internship Rochester General Hospital, New York, 1951 to 1952. Granted TL-195, July 18, 1957. Granted Permanent License M-2382 on the basis of Pennsylvania written examination. Pediatrics.

James H. Cuykendall, Caldwell. Graduate University of Colorado Medical School, Denver. M.D. Degree, June 1950. Internship St. Joseph Hospital, Denver, 1950 to 1951. Granted TL-197, August 27, 1957. Granted Permanent License M-2383 on the basis of Colorado written examination. Radiology.

Robert F. Crawford, Hells Canyon. Graduate of Emory University Medical School, Atlanta. M.D. Degree June 1954. Internship Hospital of the University of Pennsylvania, Philadelphia, 1954 to 1955. Granted TL-198, October 28, 1957. Granted Permanent License M-2384 on the basis of Georgia written examination. General.

Paul R. Stowell, Salt Lake. Graduate of Yale School of Medicine, New Haven. M.D. Degree, June 1955. Internship Salt Lake General Hospital. Granted TL-190, April 1, 1957. Granted Permanent License M-2386 on the basis of Pennsylvania written examination. Padiatrics.

William E. Powers, Coeur d'Alene, Graduate University of Illinois, Chicago. M.D. Degree, June 1951. Internship Bames Hospital, St. Louis, 1951 to 1952. Granted TL-196 August 3, 1957. Granted Permanent License M-2387 on the basis of Missouri written examination. Radiology.



Licenses to practice medicine and surgery in Idaho were granted the following candidates on the basis of written examination in a state maintaining standards comparable to Idaho, or through certification of the National Board of Medical Examiners:

Elmer Carson Rigby, California. Graduate University of Utah. M.D. Degree, 1942. Internship Boston City Hospital, 1942 to 1943. Granted Permanent License M-2385 on the basis California written examination.

William E. Afton, Boise. Graduate University of Colorado Medical School. M.D. Degree, September 1944. Internship Mercy Hospital, Denver, 1945 to 1951. Granted Permanent License M-2388 on the basis of Colorado written examination. Psychiatry.

William R. Rumel, Salt Lake. Graduate Northwestern University. M.D. Degree 1936. Internship St. Luke's Hospital, Chicago. Granted Permanent License M-2389 on the basis of Illinois written examination.

(Continued on page 376)

(Continued from page 375)

Marion John Renner, Goodland, Kansas. Graduate University of Kansas. M.D. Degree, June 1922. Internship Cleveland City Hospital, Cleveland, 1922 to 1923. Granted Permanent License M-2390 on Kansas written examination. General.

Joseph E. Cooper, Pocatello. Graduate Hahnemann Medical School, Philadelphia. M.D. Degree 1938. Internship Wyoming Valley Hospital, Wilkes-Barre, Pennsylvania. Granted Permanent License M-2391 on the basis of Pennsylvania written examination. Surgery.

Fred E. Marinenau, Sandpoint. Graduate University of Iowa Medical School. M.D. Degree, June 1955. Internship United States Naval Hospital, Bremerton, Washington. Granted Permanent License M-2392 on the basis of Iowa written examination. General.

Carl L. Moller, Jr., Hells Canyon. Graduate Stanford University School of Medicine. M.D. Degree, June 1955. Internship San Francisco Hospital, 1955 to 1956. Granted Permanent License M-2393 on the basis of California written examination. General.

John W. Swartley, McCall. Graduate of University of Oregon Medical School, Portland. M.D. Degree, June 1952. Internship Fresno County Hospital, 1952 to 1953. Granted Permanent License M-2394 on the basis of California written examination. General.

Alton R. Stier, Washington. Graduate University of Oregon Medical School, Portland. M.D. Degree, June 1952. Internship Indianapolis General Hospital, Indianapolis, July 1952 to 1953. Granted Permanent License M-2395 on the basis of Oregon written examination. Pathology.

Robert J. Hartmann, Hawaii. Graduate of University of Illinois Medical School, Chicago. M.D. Degree, July 1946. Internship U.S. Naval Hospital, Great Lakes, Illinois, 1946 to 1947. Granted Permanent License M-2396 on the basis of Illinois written examination. General.

Two members of the Board, Chairman S. M. Poindexter, Boise, and Leland K. Krantz, Idaho Falls, attended the 54th Annual Congress on Medical Education and Licensure, and the Annual Meeting of the Federation of State Medical Boards in Chicago, February 8-12.

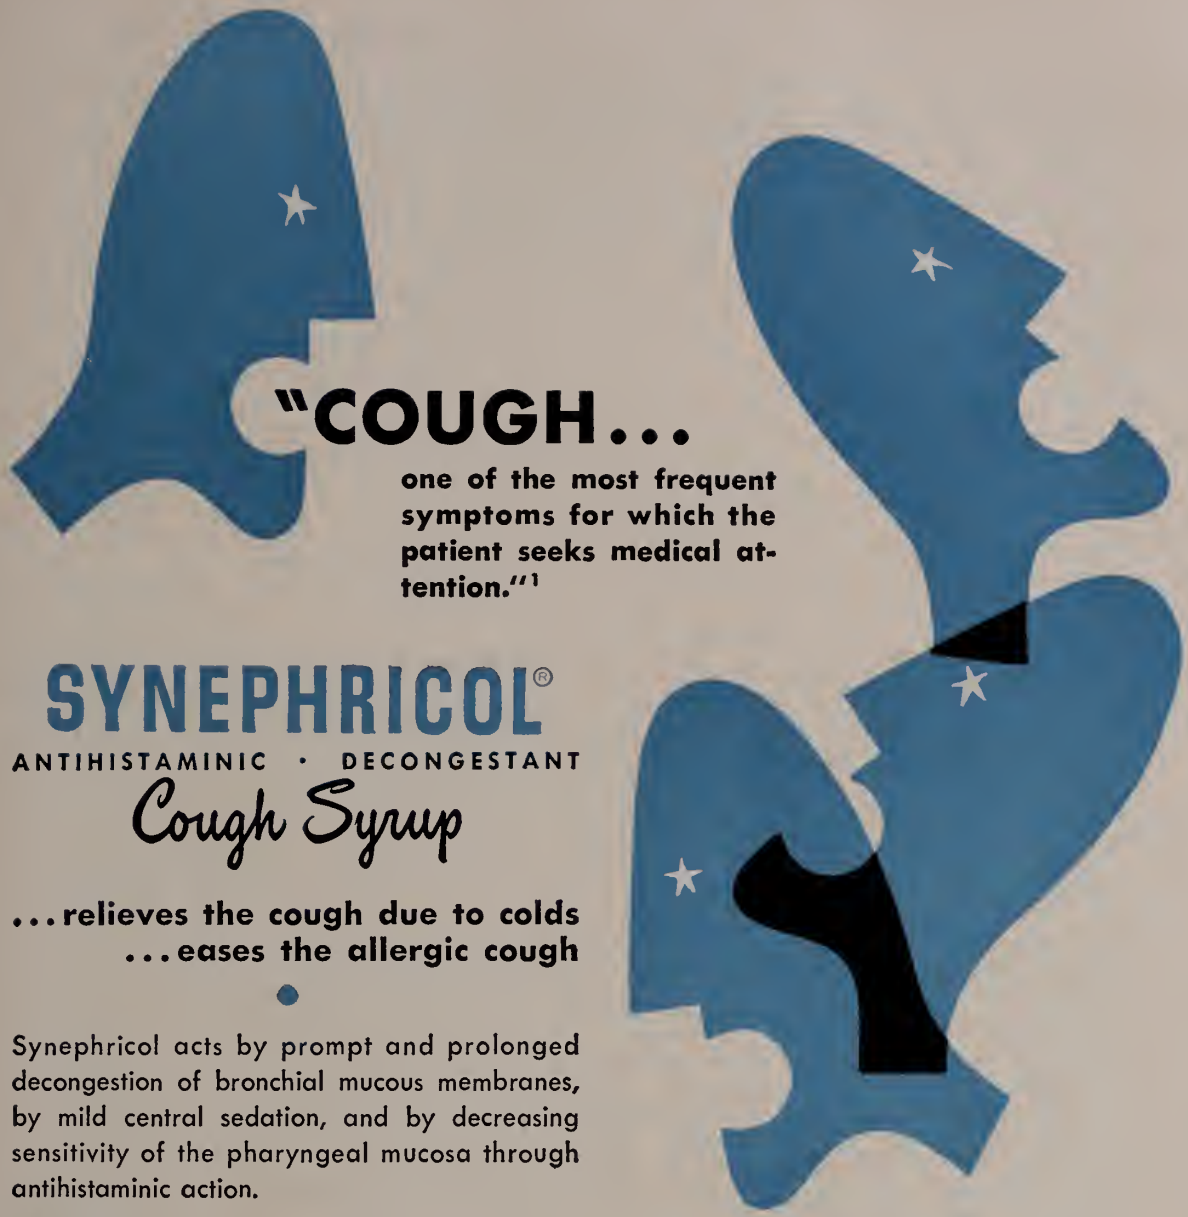
Dr. Poindexter served as Chairman of the Committee for Reports of Officers of the Federation, is a member of the five man Permanent Committee of the Federation for Examination Institutes, and attended a meeting of the Executive Committee of the Federation of which he is a member.

During the meetings, the Second Examination Institute was held. Dr. Krantz was the official Idaho Delegate to this session, and participated in discussions on anatomy, pathology, bacteriology, and surgery.

J. W. Marshall Receives Civic Award

Joseph W. Marshall of Twin Falls recently was presented with the Junior Chamber of Commerce senior citizen award for 1957. The presentation was made by Governor Robert E. Smylie at a banquet meeting. Dr. Marshall received the award for his activities in community life which include his church, service club, Boy Scouts and the medical profession.

LIVERMORE SANITARIUM



This facility provides an informal atmosphere seldom found in hospitals elsewhere. A sound and scientific approach to emotional problems is provided with careful deliberation, with the patients' best interests given every consideration. Our approach is eclectic with emphasis along the lines of dynamic and psychobiologic psychiatry. Every recent therapy is available.

Individual services are amply provided for; in individual cottages if desired, so that the patient's every need is considered.

All diagnostic and ancillary consultative services are available.

Information upon request.

Report from the Washington Office of AMA

Thomas H. Alphin, M.D.

Washington, D. C.—Those who are trying to follow the course of medical legislation, find an unusual situation developing in this session of Congress. All of Washington is being subjected to forces, some completely new, that often work at cross-purposes to each other. The result could be a moratorium on health legislation—or again it could be a flood of new laws.

At the start of the session, a new-born interest in science completely dominated the scene—by a frantic spending of billions of dollars we would overtake Russia. That was the theme in Washington, and it persisted despite a few quiet voices that asked whether Russia really had far outdistanced the U.S. or was merely exploiting a slight advantage.

Even before the American satellite started on its orbit, some of the panic had subsided, and most of the legislators had decided that advent of the space age had not removed all of the old problems and opportunities in legislation and politics. The familiar issues were still there, medical panaceas included.

The shock of Russian achievements will, at any rate, produce legislation designed to shore up our educational system. This seems to be generally accepted. For the medical profession, two provisions are of major interest. Scholarships would be either four years—possibly six—offering some assistance to premed students and in some cases to those in their first year of medical school. Also, fellowships would be available for medical and other graduates if they wanted to teach or go into research.

The administration's idea was a program that would cost a billion dollars; several leading Democrats joined in a bill proposing three billion dollars as a stimulant to mathematics and science.

But there are other factors to be reckoned with. For the first time a President set down in black and white in his budget just how he proposed to withdraw the federal government from some activities, or limit its participation, and turn the programs back to the states. Mr. Eisenhower wants to slow down on the Hill-Burton hsopital construction program and change its emphasis; he wants to mesh in some veterans' benefits with social security payments; he would have the states do more and the U.S. less in public assistance (where medical payments are a growing factor), and he hopes to get Congress to drop the $50 million a year program of grants to help build water treatment plants.

Whether Congress will follow the President's lead in the back-to-the-states movement is another question. At least he has said specifically what he thinks should be done, and when.

There was no expectation that the Russian scare would dilute politics this election year—and it has not. If anything, the partisans are struggling harder than ever to make records that will reflect glory on them next November. Some, of course, would be pressing for their projects regardless of the election.

So this is the prospect, in brief:

The Defense Department and science will get the major attention and the major money, but some may spill over into medicine.

There is some interest in a tight domestic budget and returning certain activities to the states, but old-fashioned politics combined with a fear of a continuing recession may again open up the federal purse.

Medical legislation, always a popular subject, may get more and more attention as the session rolls on. If so, the Forand bill among others would come immediately to the fore.

Notes:

Several developments in the legislative field on Jenkins-Keogh bills came early in the session. The American Thrift Assembly, representing some 10 million self-employed, urged favorable House Ways and Means action, and the American Medical Association pointed out that the proposal for tax deferment of money paid into retirement plans could help solve the problem of maldistribution of physicians.

In the Senate, a majority of the Small Business Committee introduced a tax relief bill with a J-K provision. This section would allow anyone

SEARLE *announces...*

a superior psychochemical
for the management of both
minor and major
emotional disturbances

Dartal T.M.

dihydrochloride

brand of thiopropazate dihydrochloride

- more effective than most potent tranquilizers
- as well tolerated as the milder agents
- consistent in effects as few tranquilizers are

Dartal is a unique development of Searle Research, proved under everyday conditions of office practice

It is a single chemical substance, thoroughly tested and found particularly suited in the management of a wide range of conditions including psychotic, psychoneurotic and psychosomatic disturbances.

Dartal is useful whenever the physician wants to ameliorate psychic agitation, whether it is basic or secondary to a systemic condition.

In extensive clinical trial Dartal caused no dangerous toxic reactions. Drowsiness and dizziness were the principal side effects reported by non-psychotic patients, but in almost all instances these were mild and caused no problem.

Specifically, the usefulness of Dartal has been established in psychoneuroses with emotional hyperactivity, in diseases with strong psychic overtones such as ulcerative colitis, peptic ulcer and in certain frank and senile psychoses.

Usual Dosage • In psychoneuroses with anxiety and tension states *one 5 mg. tablet t.i.d.*

• In psychotic conditions *one 10 mg. tablet t.i.d.*

not now benefitting from a qualified pension plan to set aside 10 per cent of annual income ($1,000 maximum). The bill went to Senate Finance Committee.

* * *

A limited number of medical scientists from this country and Russia will give lectures in each other's countries this year in an exchange program worked out by the State Department and the Soviet government. Also planned are exchanges of medical journals between medical libraries and of medical films. All these are part of a broad scientific, cultural and education program between the two nations. Details have not been worked out.

* * *

Six members of the Health Resources Advisory Committee have been named by Defense Mobilizer Gordon Gray. The committee, headed by Elmer Hess, advises government on health and medical problems in time of war or national emergency. Members are George C. Whitecotten, Oakland, Calif.; Franklin Yoder, Cheyenne, Wyo.; Mary Louise Gloechner, Conshocken, Pa.; Harold Oppice, D.D.S., Chicago; William Walsh, Washington, D. C., and Frances Graff, R.N., Grand Rapids, Mich.

COOK COUNTY GRADUATE SCHOOL OF MEDICINE

INTENSIVE POSTGRADUATE COURSES
STARTING DATES—SPRING, 1958

SURGERY—Surgical Technic, Two Weeks, March 24, April 21, May 12
Surgery of Colon and Rectum, One Week, May 5
Treatment of Varicose Veins, May 5
Gallbladder Surgery, Three Days, June 2
Surgery of Hernia, Three Days, June 5
General Surgery, Two Weeks, May 5; One Week, May 12
Fractures & Traumatic Surgery, Two Weeks, June 9
Breast & Thyroid Surgery, One Week, May 5

GYNECOLOGY & OBSTETRICS—
Office & Operative Gynecology, Two Weeks, April 14
Vaginal Approach at Pelvic Surgery, One Week, April 28
General & Surgical Obstetrics, Two Weeks, May 5

MEDICINE—General Review Course, Two Weeks, May 12
Electrocardiography, One Week Advanced Course, June 16
Hematology, One Week, June 2

PEDIATRICS—Two-Week Intensive Course, April 21

DERMATOLOGY—Clinical & Didactic Course, Two Weeks, May 5

RADIOLOGY—Diagnostic X-Ray, Two Weeks, April 28
Clinical Uses of Radioisotopes, Two Weeks, May 5

UROLOGY—Two-Week Intensive Course, April 14
Cystoscopy, Ten-Day Practical Course, by appointment

TEACHING FACULTY—ATTENDING STAFF OF COOK COUNTY HOSPITAL

ADDRESS: REGISTRAR, 707 South Wood Street, Chicago 12, Illinois

She's Been **SONATED**

She's just one of more than a million patients who have been treated with Ultrasound by the more than 20,000 physicians using Ultrasonics in their practices. If you are thinking of buying an Ultrasonic examine the mechanical features · look at the transducer. Is it adaptable (adjustable) to all five of the recommended treatment positions? Is the crystal small enough (5CM² is the experts' choice) to treat the concave areas? Is the electronic circuit stable so that output remains constant throughout treatment? Is the dosage always what reads on the meter? Is the manufacturer experienced in producing equipment for the medical profession? Does he have dealers everywhere to give you service when you need it? You owe it to yourself to know the answers to these questions. In all sincerity we believe that every Birtcher MEGASON Ultrasonic (there are four models, you know) will meet your every qualification.

64 page booklet "Medical Ultrasonics in a Nutshell" answers 25 commonly asked questions about ultrasound and contains abstracts of several medical journal articles.

World Congress of Gastroenterology To Meet in Washington, D.C., May 25-31

American Gastroenterological Association will host the first world congress to be held in the United States. More than 200 national and international scientists, physicians, surgeons, roentgenologists, and parasitologists will gather in Washington, D.C., May 25-31 at the World Congress of Gastroenterology to present the most recent clinical and investigative advances in gastroenterology.

The program will include five main symposia: Peptic Ulcer, Intestinal Infections and Infestations, Malabsorption, Nutrition and its Effect on the Liver and Pancreas, and Gastric Carcinoma. In addition, more than 150 papers will be presented. Throughout the entire meeting, simultaneous interpretation to and from the German language, Spanish, French and English will be available in the main auditorium.

To date, of the more than 200 individuals scheduled to appear on the program, 36 are from the U.S. and the remainder from 43 other countries. Representation on important scientific topics will be made from Argentina, Australia, Belgium, Brazil, British West Indies, Canada, Chile, Columbia, Cuba, Denmark, El Salvador, Dominican Republic, Egypt, France, Germany, Great Britain, Greece, Hungary, India, Israel, Italy, Japan, Mexico, Morocco, Netherlands, Norway, Paraguay, Peru, Poland, Portugal, Puerto Rico, Rumania, South Africa, Spain, Sweden, Switzerland, Syria and the U.S.

Those desiring further information about the World Congress, such as accommodations, registration and activities, are asked to contact: H. Marvin Pollard, M.D., Secretary General, World Congress of Gastroenterology, University Hospital, Ann Arbor, Michigan.

Pan-American Medical Women's Alliance To Meet in Miami, Florida, April 14-17

Sixth Congress of the Pan-American Medical Women's Alliance will be held in Miami, Florida, April 14-17 at the Hotel McAllister. All women physicians in the United States and Canada have been invited to attend the sessions which are held every two years alternately in North and South America.

The scientific program will be translated into both English and Spanish and will deal with medical problems of mutual interest to medical women of the two continents.

Requests for additional information should be addressed to: Hilla Sheriff, M.D., Director of Division of Maternal and Child Health, South Carolina State Board of Health, Columbia 1, S.C., or Eva Dodge, M.D., Department of Obstetrics and Gynecology, University of Arkansas, Little Rock, Ark.

Neurologists and Psychiatrists Set Meet

Annual convention of the North Pacific Society of Neurology and Psychiatry will be held April 11-12 at the Empress Hotel, Victoria, B. C. Guest speakers will be Augustus S. Rose, professor of neurology, University of California School of Medicine at Los Angeles and Brock Chisholm, president, World's Federation for Mental Health and former director of the World Health Organization.

"KENACORT" IS A SQUIBB TRADEMARK

Clinical Pathologic Conference

VIRGINIA MASON HOSPITAL, SEATTLE, WASHINGTON

Prepared under direction of Henry Tesluk, M.D.

Protocol

This was the fifth admission of this 53 year old white, single, retired logger and bartender who was admitted complaining of vomiting coffee-ground material and passing bloody stools.

Past history and personal habits: There is no record of any serious childhood diseases. In 1928, he claimed to have had a six week episode of rheumatism which had not bothered him since. He had been a heavy drinker since the age of 15, consuming up to 2 quarts a day, but claimed to have stopped drinking in August 1956. He smoked up to a package of cigarettes daily.

Present illness: The patient dated the onset of his illness at 1950 when he lacerated the dorsum of his left hand with a rusty nail. He developed lymphangitis which was first treated ineffectively with pencillin and then for three weeks with sulphonamides. Shortly after the institution of sulfa therapy, there was onset of chills and fever, marked pedal edema, arthralgia, and generalized discomfort. Associated with these symptoms was a wide-spread purpuric rash which was particularly evident on the lower extremities. This illness was marked by a course of remissions and exacerbations but disappeared entirely in 1955. As these symptoms improved, he began to lose his appetite and, by the summer of 1956, had lost 25 to 30 pounds. In August 1956, he began taking iron because of severe anemia. He improved on this regimen, regaining some weight. He still tired easily. He was first seen at the Mason Clinic in December 1956 with a complaint of easy fatiguability. A persistent, dry, hacking cough had been present for six months.

He appeared chronically ill with spider angiomata. Several petechiae were noted on the arms and about the ankles. He was blind in the right eye as a result of a childhood accident. The left sclera was strikingly injected with some areas of hemorrhage. Funduscopic examination showed grade II sclerotic changes. Mucous membranes of the mouth were pale. The heart had normal sinus rhythm with rate of 100. A grade II aortic systolic murmur was heard. Abdominal examination revealed an enlarged, firm, non-tender liver palpated six finger breadths below the costal margin. The spleen was not palpable. There was bilateral clubbing of the fingers.

Laboratory data: Hemoglobin 5.2 Gm.; packed cell volume 19 per cent; sedimentation rate 76/22 mm/hr.; white blood count 4550; differential lymphocytes 25, monocytes 36, neutrophils 17, stabs 3, and monoblasts 20; platelets (estimated) 150,000. Serologic tests for syphilis were nonreactive. Chemical studies: blood sugar 173, thymol turbidity 13.5 units and BSP retention of 5 per cent. Urinalysis: 1+ proteinuria, 6-8 granular casts/h.p.f. and 2-3 white cells/h.p.f. Roentgenologic studies indicated an infiltration in the left upper and mid-lung fields with a mediastinal shift to the left. Infiltrations were also seen in the right mid-lung field and lung base.

Subsequent laboratory data: Blood sugar 106; NPN 37, platelet count 10,000. Bone marrow showed depression of neutrophilic series with 20 per cent monocytoid blast forms, 8 per cent monocytes. GE ratio 2:1; erythroid elements present in normal proportions. Sputum smear was negative for acid fast organisms.

The patient was transfused with 8 units of blood and treated with 6-mercaptopurine to the toxicity limit. He was discharged after a week with hemoglobin of 11.9 Gm., packed cell volume of 40 per cent and white count of 2,000. A differential blood smear revealed a decrease in blast forms to 4.

At home the patient was alternated on 6-mercaptopurine and vitamin K therapy. Regular

(Continued on page 386)

(Continued from page 385)

hematologic studies showed little change in his blood picture. There were two episodes of epistaxis during this period.

The patient was readmitted to the hospital a month after discharge for intractable nose bleed. He also had vomited. Physical findings were the same as noted previously except for blood pressure of 75/40 with pulse rate of 104. Shotty inguinal lymph nodes were also palpable. At this time, hemoglobin was 2.6 Gm.; white blood count 4,625 with differential showing 3 blast forms. NPN was 89. The patient was given 7 units of blood and continued on a regimen of vitamin K. He was discharged in a few days with hemoglobin of 11.8 Gm. and leukocyte count of 4,880. He did well except for frequent nose bleeds and required several additional transfusions.

Final admission was required in March 1957 because of coffee-ground vomitus, which later was seen to be strongly guaiac positive. He was quite depressed at this time and unresponsive to questioning. He had noted a severe headache a week prior to admission but it had declined in intensity since its onset. Blood pressure was 140/80; pulse regular, 80 per minute and temperature normal. There was nucchal rigidity. Motor weakness was diffusely present without pupillary and ocular muscle involvement. Laboratory data: hemoglobin 12.4 Gm.; white blood count 5,700 with differential of 75 per cent monocytes but no blast forms; bleeding time 12 minutes, clotting time 7 minutes; platelets estimated 130,000 and prothrombin time 24.5 seconds with a control of 15 seconds. He was given 1 unit of blood and started on vitamin K. A spinal tap showed red cells 220/cu.mm.; protein of 130 mg.; sugar, 48 mg.; colloidal gold curve, 55555222100. Blood cultures were negative. After several days in the hospital, nucchal rigidity became less severe and the patient more responsive. Epistaxis was noted again and prednisilone was given in an effort to control the bleeding. Gross blood was also noted in the urine. He developed 104 F. fever. Left sided tonic-clonic seizures were noted. Terminally the hemoglobin was 11 Gm. with leukocyte count of 23,000. He became stuporous and died after three weeks in the hospital.

Differential Diagnosis

Rowland Pearsall: The patient for our conference today presents an extremely interesting and complicated problem in diagnosis. There seem to be two distinct phases in this patient's illness; whether they are actually related is somewhat difficult to say. From 1950 to 1956 he had recurring episodes of chills, fever, pedal edema, arthralgia and purpuric rash of the lower extremities. This may have been related to the use of a sulfa drug and penicillin for lymphangitis of his arm at the onset of this set of symptoms. If so, this suggests the possibility of a hypersensitivity angiitis or perhaps periarteritis nodosa. In the spring and summer of 1956 the patient began to lose weight and became anemic. He developed a rather dry, hacking cough along with spider angiomata of his skin. His physical examination revealed an enlarged liver, a heart murmur over the aortic area, and clubbing of the fingers. He had been blind in his right eye for many years, apparently from an accident.

This patient's laboratory studies revealed strong evidence for acute monoblastic leukemia with marked anemia, and thrombocytopenia. The only liver function tests available from the protocol are thymol turbidity, which was definitely increased, and prolonged prothrombin time. The BSP, however, was within normal limits. At this point we note that the chest film showed infiltration in the left upper and left mid-lung fields with mediastinal shift to the left. There were also minimal infiltrations in the right mid-lung field and right lung base. (See figure 1.) This film was made at the time of the initial

Fig. 1. Chest film showing bilateral pulmonary infiltration with some mediastinal left shift.

(Continued from page 386)

examination. No further films were made. The reason for this obviously was that the diagnosis seemed to be that of acute leukemia and it was the opinion of the physicians seeing this patient that he most likely had leukemia infiltration in his lung. The possibility of tuberculosis was considered. However, this was not followed up. One sputum examination was done and this was negative on smear for acid fast organisms.

This patient's subsequent hospital course was consistent with the clinical diagnosis of acute leukemia—either myeloblastic or monoblastic in type—and cirrhosis of the liver. He had several admissions for anemia resulting from severe hemorrhage. The terminal portion of his illness began approximately four months after his initial visit, with severe headache and subsequent findings pointing to cerebral hemorrhage. Terminal convulsive seizures on the left indicated a right cerebral hemisphere lesion.

His blood smear at this time showed no blast forms but 75 per cent monocytes. The spinal fluid protein terminally was 130 with moderate numbers of red cells and white cells, there being 57 lymphocytes and 117 polys observed, along with xanthochromic fluid. Many non-syphilitic spinal fluids will show increased protein from old hemorrhage or tumor and it seems probable that the colloidal gold curve can be explained on this basis also. One would expect that the greatest change should be in tube 6 and 7 if this were tuberculosis meningitis. Apparently no cultures were done on the spinal fluid for tuberculosis.

The patient then had the following:

(1) A lung lesion, not particularly emphasized in the protocol and apparently not given great consideration during the patient's terminal illness. This lesion may have been due to leukemic infiltration, carcinoma of the lung, fungus disease or tuberculosis. We have no real evidence from the information available as to which one of these possibilities the patient actually had.

(2) An apparent liver lesion consistent with the diagnosis of cirrhosis, probably of the Laennec's type. This is supported by a chronic alcoholic history and physical findings. The laboratory studies available favor cirrhosis, although extensive studies were not done in this regard.

(3) Urinary tract bleeding from a renal or bladder lesion probably due to a hemorrhagic diathesis. One should consider the possibility of renal tuberculosis however, and perhaps neoplasm.

(4) A brain lesion, probably due to hemorrhage.

(5) Obvious GI bleeding terminally.

(6) Terminally the patient also had a heart murmur and fever. Actually this patient did not have a febrile illness although there is no detailed record of his temperature until his terminal admission. The possibility of bacterial endocarditis arises, but there seems little evidence to support this.

(7) We also have an eye lesion and a large liver. This should make one think of melanoma. However, we can find no clinical grounds on which to make this diagnosis.

(8) Lastly and most important, we have a patient with a bone marrow lesion. This must either be an acute leukemia, probably monoblastic in type, as was considered clinically, or a leukemoid reaction.

Could this be a leukemoid reaction? We know that a variety of pathologic conditions may be mistaken for leukemia just as leukemia may be mistaken for other conditions. Also, lymphosarcoma, particularly in children, may be characterized by large numbers of circulating neoplastic cells and simulate acute lymphogenous leukemia. This is said to occur most often when the lymphosarcoma has invaded a moveable organ such as the lung. In thinking about leukemoid reactions, it is important to realize that the differentiation of a leukemoid reaction from true leukemia may on rare occasions be extremely difficult, if not impossible, from either the clinical picture or cellular study. Fever, hemorrhage, splenomegaly, and adenopathy may occur. The causes of leukemoid reactions are as follows:

(1) Infection. Counts as high as 150,000 with 50 per cent myeloblasts have occurred in patients with overwhelming infections of practically any type, including tuberculosis. Lymphocytic reactions have occurred from infectious mononucleosis and other virus diseases, as well as tuberculosis, which have been practically indistinguishable from acute leukemia. Monocytic reactions, however, are most common with tuberculosis, and this is important to keep in mind, as it may apply to our patient.

(2) Intoxications, such as burns, mercury poisoning, and eclampsia, may result in a leukemoid reaction.

(3) Malignancies which have invaded the bone marrow may cause a leukemoid reaction, particularly metastatic carcinoma, multiple myeloma and Hodgkin's disease.

(4) Severe hemorrhage or hemolysis may cause a leukemoid reaction.

Tuberculosis is the most common cause of a leukemoid reaction. Usually it is miliary with lymph node or spleen involvement. Monocytosis is most likely to occur when the disease is progessive.

As far as the diagnosis of acute leukemia is concerned, the evidence favors the monoblastic type. Many hematologists, however, feel that one can not distinguish between the types of acute leukemia in many cases. As far as our patient is concerned, it is peculiar that no adenopathy except that of a few inguinal nodes is reported at any time. One would have expected cervical lymph node enlargement, particularly if it was monocytic in type. Splenomegaly of some degree usually occurs during the course of a patient's illness with acute leukemia. This patient did not have splenic enlargement as far as we know, but did have liver enlargement. This is also perhaps one small bit of evidence against this being acute leukemia. He did have purpura and a hemorrhagic diathesis. In monocytic leukemia one would expect more bleeding from the gingival margins with ulceration and swelling. This apparently did not occur in our patient.

As far as the respiratory tract is concerned, a mediastinal mass may be the first sign of acute leukemia. Our patient did have some evidence of mediastinal involvement as well as pulmonary involvement, and it is not at all uncommon in acute myeloblastic leukemia to have migratory pulmonary lesions. In the GI tract, infiltration is somewhat unusual in acute leukemia, but when it occurs, it is found most often in the monocytic type. Our patient did have evidence of GI involvement. The terminal renal bleeding could also be explained on the basis of leukemic infiltration somewhere in the genito-urinary tract.

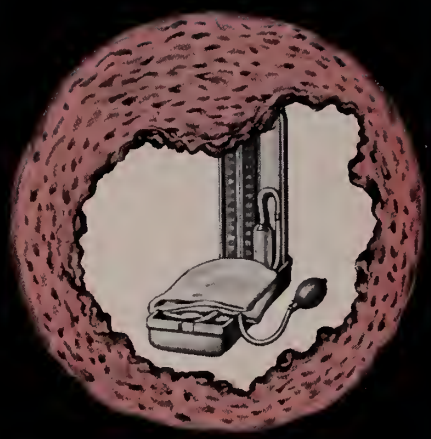
Another interesting finding that this patient had was that of clubbed fingers. It is now believed that clubbed fingers represent an early manifestation of hypertrophic osteoarthropathy. In acquired hypertrophic osteoarthropathy, primary pulmonary neoplasm is the most common cause. It is rare with lung metastasis. Chronic intrathoracic infection is the next most common cause. Congenital cyanotic heart disease often results in clubbed fingers, as does subacute bacterial endocarditis. We have no real evidence that our patient had either one of these conditions. The third important type is that due to hepatic causes. Hypertrophic osteoarthropathy is most often seen with cholangiolitic biliary cirrhosis, in itself a rare condition. It occurs less often in portal than postnecrotic, and obstructive biliary cirrhosis, as well as liver abscess and hepatic amyloid disease. Our patient probably had portal cirrhosis.

From a gastro-intestinal standpoint, intestinal tuberculosis, ulcerative colitis, regional enteritis and other types of diarrheal diseases may cause clubbed fingers. There seems little evidence that our patient had any of these conditions. In attempting to explain this patient's entire illness from 1950 to his death, the symptoms observed in the first four or five years seem the most difficult to correlate. So-called allergic rheumatism is an ill defined entity. It has been reported as being characterized by recurring episodes of articular and periarticular swelling with tenderness, associated with fever, syphiloid rashes and a high incidence of allergic reactions.

In reference to allergy, one also wonders about the possibility of some type of allergic purpura, non-thrombocytopenic in type, particularly Schonlein's purpura. This latter disease, however, occurs most often in young adults. There is periarticular swelling without joint hemorrhage. It most often affects the lower extremities and is associated usually with purpura, skin lesions and fever. There is no evidence that our patient had this condition.

In summary, then, we have a patient with rather strong clinical evidence that acute leukemia was the primary pathologic process. There are certain atypical features present, however, and careful perusal of the possibility that the patient had a leukemoid reaction suggests that this indeed could have been the primary nature of the illness. If a leukemoid reaction did exist, then tuberculosis is the outstanding possibility and the only one that could explain the picture.

I favor the latter possibility and my final diagnosis on the patient is: *(1) Cirrhosis of the liver with hypertrophic osteoarthropathy, (2) hemorrhagic diasthesis and terminal cerebral hemorrhage with the primary proces being a leukemoid reaction of the monocytic type resulting from disseminated tuberculosis.*



Gross Pathology

Henry Tesluk: This case proved to be complicated and I must compliment Dr. Pearsall on his effective and accurate survey of the possibilities.

(Continued on page 391)

IN HYPERTENSION

Blood Cholesterol Regulation Is Desirable

Patients with hypertension develop atherosclerosis more rapidly and at a younger age than people with normal blood pressure.[1] It is also known that clinical hypercholesteremia is associated with increased atherosclerosis[2] and that many hypertensives show elevated cholesterol levels.[3] For example, in one study including 120 patients with high blood pressure, hypercholesteremia was found in 44% of the hypertensive group.[3]

The consensus of opinion today is that elevated cholesterol levels should be reduced or prevented, and it has been amply demonstrated that this can be done very well by adding linoleic acid and vitamin B_6 to the diet. In scores of patients with hypercholesteremia, and particularly in patients with vascular disease, diets high in linoleic acid produced improvement.[4,5] Vitamin B_6 is apparently necessary to convert linoleic acid into the primary essential fatty acid, arachidonic acid. Thus the body is dependent on an intake of both linoleic acid and vitamin B_6 for normal cholesterol levels.[6,7]

This is why ARCOFAC (Armour Cholesterol Lowering Factor) provides *both* linoleic acid and vitamin B_6 in adequate amounts. As little as one dose a day lowers high blood cholesterol while allowing the patient to eat a balanced, nutritious and palatable diet.

Each tablespoonful (15 ml.) of Arcofac emulsion contains:
Essential fatty acids†.....6.8 Gm.
(measured as linoleic) with 2.5 I.U. of Vitamin E*
Pyridoxine hydrochloride (Vitamin B_6)...0.6 mg.

† Derived from safflower oil which contains the highest concentration of unsaturated fatty acids of any commercially available vegetable oil.

* Added as Mixed Tocopherols Concentrate, N.F.

References 1-7 from the 1956-57 literature supplied on request.

Armour Cholesterol Lowering Factor

THE ARMOUR LABORATORIES
A DIVISION OF ARMOUR AND COMPANY · KANKAKEE, ILLINOIS

(Continued from page 389)

At autopsy the body showed considerable evidence of cachexia especially involving the head, neck and shoulders, and there were numerous areas of ecchymosis scattered about involving skin and subcutaneous tissues. No palpable lymph nodes were encountered.

There was a rather dense, old fibrous pericarditis present with numerous adhesions. A number of moderately large firm lymph nodes were encountered in the superior mediastinum. There were numerous fibrous adhesions involving the left lung. These appeared old in character. The left upper lobe in general appeared quite firm and nodular. Numerous small firm nodules were also encountered scattered about in the lower lobe and involved portions of the right lung. The left lung weighed 540 Gm., the right 730 Gm.

The liver was slightly enlarged, weighing 2,300 Gm., but its surfaces were smooth and shiny and on cut surface all one could notice was some accentuation of the lobular pattern. No focal lesions were noted. The spleen was normal in size, weighing 250 Gm., but appeared somewhat paler than normal. The gastro-intestinal tract was not unusual with exception of areas of ecchymosis involving the gastric mucosa. There were no definite areas of ulceration. There were numerous lymph nodes encountered in the vicinity of the pancreas. These were enlarged, moderately firm and on cut section showed central necrosis and caseation.

The kidneys were normal with the exception of ecchymosis involving the mucosa of the pelvocalyceal system. (See figure 2.) The brain showed definite thickening of the meninges at the base and a focal area of hemorrhage and encephalomalacia involving the left hippocampal gyrus over an area of about 1.5 cm. in diameter. (See figure 3.) The bone marrow at the time of autopsy appeared cellular and dark red without any evidence of focal lesions.

Fig. 2. Kidney, lung and mediastinal and abdominal lymph nodes. Caseating nodules in lung and nodes.

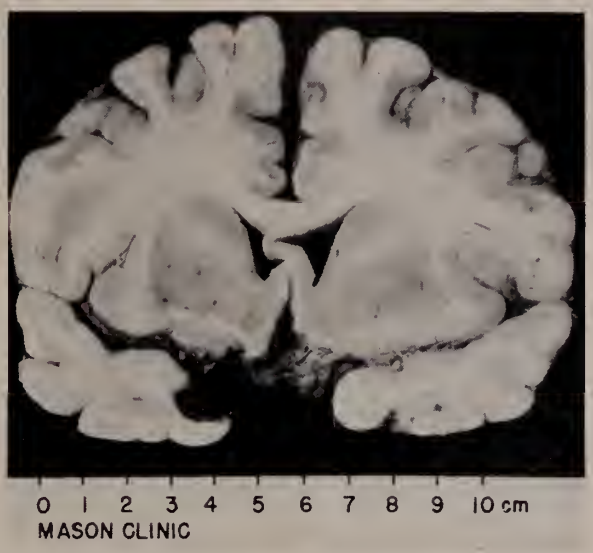

Fig. 3. Showing thickened meninges at base of brain. Hemorrhagic encephalomalacia, left temporal lobe.

In general, therefore, the gross autopsy findings failed to show any evidence for a leukemic involvement and, indeed, the major findings seemed to be confined to the pulmonary lesions, the lymph node involvement in the mediastinum and abdomen, and the thickening of the meninges encountered at the base of the brain.

Microscopic Pathology

Dr. Tesluk: Microscopic studies obtained from these organs showed rather surprising changes. The first section is from the left upper lobe and shows extensive granulomatous inflammation which are fairly discrete and which show a marked amount of caseation centrally with only a mild to moderate amount of cellular reaction surrounding them. There are, however, occasional epithelioid cells and rarely a multinucleated giant cell is encountered. One of these tubercles is endobronchial in character and shows caseation into the lumen. There are patchy areas of pulmonary edema and some tuberculous pneumonia surrounding a few of these lesions.

Sections through other portions of the lung

(Continued on page 392)

(Continued from page 391)

show somewhat better aeration but again, numerous medium sized granulomas are present. Acid fast preparation shows a scanty number of organisms in some of these granulomas. The section taken through the enlarged hilar nodes shows extensive caseation with the same type of granulomas. There is no evidence of a leukemic infiltration.

The next section is through liver and shows fairly normal architecture without any evidence of cirrhosis. There is, however, a focal granuloma in this section similar to those encountered in the lungs. This is a section through the spleen and is shown merely to indicate that there is no evidence of leukemic infiltration. Reticuloendothelial cells are fairly prominent and there are increased numbers of plasma cells scattered about. No granulomas are encountered.

The next section is through vertebral marrow. This shows some increase in cellularity with increased numbers of rather immature looking cells but there are at the same time islands of erythropoiesis present as well as numerous megakaryocytes. The preservation of the architecture again suggests evidence against leukemia. No definite granulomas are encountered. The next slide is an oil immersion field from bone marrow smears prior to death to demonstrate the nature of the cells thought to be leukemic. There are several very immature cells present. (See figure 4.)

The last section is through the central nervous system through the thickened meninges at the base and this shows an extensive granulomatous meningitis with numerous tubercles present. (See figure 5.) These are also present in the choroid plexus and in the ependymal lining. In addition, there is a definite area of hemorrhagic encephalomalacia in the lesion noted in the gross in the left hippocampal gyrus. There is no evidence anywhere of leukemic infiltrate.

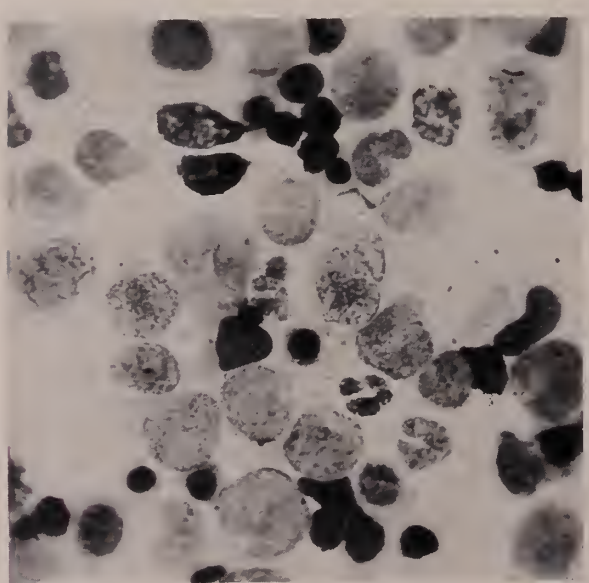

Fig. 4. Bone marrow smear (ante mortem). Shows numerous blast cells but also many mature forms with erythropoiesis are present. (Wright's stain, 667x.)

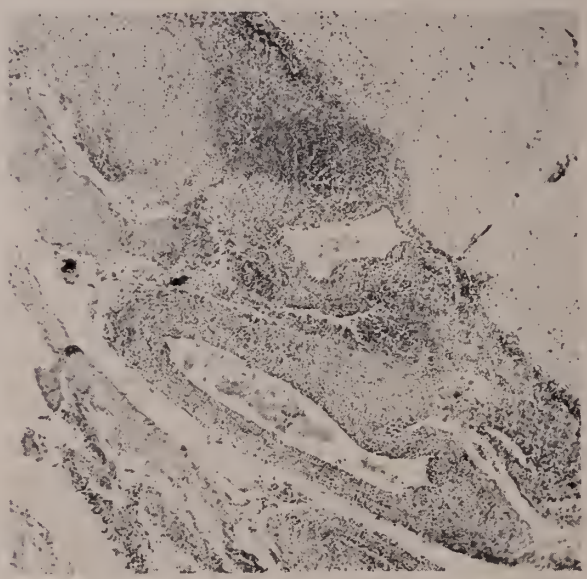

Fig. 5. Basilar meninges. Caseating granulomatous meningitis. (H & E stain, 80x.)

Conclusion

Dr. Tesluk: In summary, this patient had an extensive tuberculous infection involving lungs and lymph nodes primarily but showing some evidence of vascular spread with occasional lesions encountered in the liver and he terminally developed a tuberculous meningitis. The evidence available at the time of autopsy strongly suggests that there is no true leukemia present despite the marked atypicality of the cells encountered on bone marrow smear and peripheral blood examination.

Tuberculosis is known to be associated clinically on occasion with at least three types of disturbance from a hematologic standpoint—myelosclerosis with a leukoerythroblastic anemia, a leukemoid reaction and a peripheral pancytopenia. The pancytopenia is probably the best term to apply to the unusual situation encountered in this patient and this type of disturbance has been described frequently in the past in association with systemic tuberculosis.[1,2]

The disease apparently affects primarily middle aged men and at first is manifested by an anemia and terminally by fever and toxemia. These patients frequently show weight loss, sometimes have an enlarged spleen and a skin rash. The differential diagnosis from leukemia is sometimes extremely difficult and establishment of the presence of a tuberculous infection is sometimes difficult. Some authors have suggested that a punch biopsy of the liver may yield important information and certainly sections of bone marrow aspirates may on occasion disclose the presence of granulomas.

The pathogenesis in this disorder is of considerable interest. The hematologic phase of the disease has been produced experimentally in rabbits by Sabin[3] in 1927 and it is thought that it probably represents a reactive hyperplasia of hematopoietic tissue overly sensitized by the presence of tuberculosis and leading eventually to an exhaustion hypoplasia.

The tuberculosis in these patients frequently is somewhat atypical in that there is extensive caseation with little reaction. The syndrome should be appreciated and kept in mind by internists and hematologists especially, since they may encounter it in patients suspected of having leukemia.

There, of course, exists the possibility that leukemia was acually present in this patient. The bone marrow smears taken clinically have been reviewed and at least two hematologists practicing in this community have indicated that the diagnosis is still monocytic leukemia even knowing that the patient had tuberculosis. I think the fact that a similar reaction can be produced experimentally coupled with the knowledge that there is no evidence of leukemia from a morphologic standpoint at autopsy certainly places the burden of proof on their shoulders that leukemia is present in addition to tuberculosis. •

helps anemic knights to more vigorous days

Glytinic®

the new amino acid-iron hematinic!

Dragon-slaying in the days of King Arthur was a rugged task for even Sir Lancelot! • Yet blood-building with iron, and iron alone, is often just as difficult...because a protein deficiency frequently accompanies iron deficiency anemia. Without glycine, formation of the blood molecule cannot take place* and iron is unsatisfactorily or incompletely assimilated. • That's why Glytinic, Boyle's new Amino Acid-Iron Hematinic, contains both glycine and ferrous gluconate...and that's why Glytinic often succeeds in building blood where other hematinics fail. Next time you're faced with an iron-deficiency anemia, help him enjoy more vigorous days by prescribing Glytinic...available in 100 tablet or 1 pint bottles.

Daily Dose (2 tablespoonfuls or 4 tablets) of Glytinic contains: Ferrous Gluconate-13.5 gr.; Glycine-1.3 Gm.; Vitamin B-12-10.0 mcg.; Thiamine HCl-7.5 mg.; Riboflavin-7.5 mg.; Pyridoxine HCl-2.25 mg.; Niacinamide-45.0 mg.; Panthenol-6.5 mg.; Liver Fraction 1, NF-5.0 gr.; Cobalt-0.05 mg.; Manganese-5.0 mg.

PRE-EMPLOYMENT DISABILITY EVALUATION—Detailed Policies Regarding Applicants Applying for Employment with Special Reference to Various Disabilities. By William A. Kellogg, M.D., Clinical Professor of Surgery, New York Polyclinic Post-Graduate Medical School; Preface by H. L. Herschensohn, M.D., Medical Director, Douglas Aircraft Co., Inc., Santa Monica, Calif. 155 pp. Price $10.50. Charles C Thomas, Springfield, Ill. 1957.

Pre-Employment Disability Evaluation by William A. Kellogg clearly outlines the problems encountered by physicians who examine persons—with or without physical impairment—with the idea of placing the individual in a phase of industry that will eliminate undesirable results from both the standpoint of the individual and his employer. This manual covers the handicapped as well as the normal individual and describes the proper placement of each. It has been perforated both for tearout, and for easy insertion into a looseleaf folder for the addition of supplemental information from time to time. It is divided into 23 sections encompassing the body systems, general information as suggestions to the examining physician or nurse, and suggested medical forms.

In these sections are listed causes for rejection, re-examination, and restrictions for certain classifications of work, because of specific disease or impairment. In general, the volumn is of value as a basic guide to the nurse or physician who has had little experience in pre-employment examinations, but is also of value as a source of ready specific information for reference by the more experienced examiner.

Quentin W. Mack, M.D.

TAKE A LOOK AT NEW DIMETANE® THE UNEXCELLED ANTIHISTAMINE

ANATOMIES OF PAIN. By K. D. Keele, M.D., F.R.C.P., Consultant Physician, Ashford Hospital and Staines Hospital, England. 206 pages. Illustrated. Charles C Thomas, Springfield, Ill. 1957.

This little book presents an excellent history of the anatomic and physiologic basis of pain. The author does an admirable job in showing how changing ideas on this aspect of pain have flowed as a continuous process from the most ancient time until the present day. He presents many detailed data to disprove the rather prevalent misconception that nothing of value that can cast any useful or revealing light on the problem of pain can have existed previous to the important advances of the last century.

In the first chapter, which is entitled "The Sensory Heart," the author philosophises with the probable concept concerning pain held by primitive man and then relates historical findings which indicate the concept held by Egyptians, Mesopotamians, and the peoples of ancient India and China. The second chapter is devoted to a detailed account of the contribution of ancient Greek philosophers and physicians, beginning with Pythagoras in the 6th century B.C. and including such colossi as Alcmaeon, Anaxagoras, Empedocles, Diogenes, Democritus, Plato and others. The author devotes much of this chapter to a detailed analysis not only of the achievements of Aristotle's amazing intellectual powers, but also the magnitude of his errors concerning this problem. The third and fourth chapters contain important fragments on the history of pain from the time of Aristotle to the beginning of the 19th century. It includes contributions of Theophrastus, Herophilus, Galen, Avicenna, Leonardo da Vinci, Vesalius, Eustachius, William Harvey, Descartes and Von Haller. The fifth chapter contains many little known and frequently unappreciated events which led to the discovery of the spinothalamic tract and the thalamic relay stations to pain. The next chapter concerns concepts of pain mechanisms which have been developed during the 20th century and includes some of the work of Head, McKenzie, Dejerine, Sinclair, Wedell and their colleagues, Trotter, Lariche, Lorento de No, Lewis, Wolff and associates, among others. In all of these chapters the author has rendered accounts in an objective manner. In the seventh and last chapter, however, he expresses his personal views of the present concept on the anatomy of pain.

The book should prove of special value to those physicians particularly interested in the pain phenomenon, as well as to anatomists, physiologists, and and anyone interested in the history of medicine. Except for the last chapter, the book will prove of little or no clinical value to the busy practitioner.

John J. Bonica, M.D.

EAR, NOSE AND THROAT DYSFUNCTIONS DUE TO DEFICIENCIES AND IMBALANCES. By Sam E. Roberts, M.D., Associate Professor of Otolaryngology, University of Kansas School of Medicine, Kansas City, Missouri. Foreword by Morris Fishbein, M.D. 322 pp. Price $8.50. Charles C Thomas, Springfield, Ill. 1957.

This author indictes the medical profession with too little clinical investigation and too much dependence on the negative results of clinical laboratories.

He emphasizes that teaching of the specialties should be by preceptorships and with greater attention to subclinical imbalances, deficiencies and subclinical deficiency diseases—such as the vitamin balance, the endocrine balance, the electrolyte balance, the control of body temperature, the maintenance of the blood glucose level and the supply of oxygen to the cells, to give a few examples. A maladjustment of any of these or other biochemical process can result in poor health evidenced by clinically apparent conditions which we are inclined to treat without adequate consideration of the biochemical background.

The reader is cautioned to delve into the dietary

and personal history of the patient considered to have bizarre psychoneurotic complaints.

Dr. Roberts believes that with the exception of the antibiotics, chemotherapy and sedatives, therapeutics has reached an all time low, whereas with our increasing knowledge of nutrition, applied biochemistry, hormones and the aging process in which the gonads are so important, it should be at an all time high.

Many interesting case reports are presented along with dietary regimens.

This volume is interesting, refreshing and recommended reading for all doctors, especially all specialists—not strictly for otolaryngologists.

E. B. Parmelee, M.D.

THE PHYSICIAN'S OWN LIBRARY; Development, Care and Use. By May Louise Marshall, Librarian, Rudolph Matas Medical Library, Tulane University; Assistant, Orleans Parish Medical Society Library, New Orleans. 87 pp. Price $3.00. Charles C Thomas, Springfield, Ill. 1957.

This monograph on the basic planning of a physician's library fills a very definite need. It is based on sound theory in library practice and professional library experience but includes only the simple and practical methods which are applicable to the physician's library. For those who wish to pursue the subject further, references are included. Since most institutional libraries are in urban centers the physician's privately owned professional library assumes an increasing importance and it deserves careful planning and direction. The private library of a physician serves a distinctive purpose even where large institutional libraries are available. This monograph would be of great help in the organizing of any small library and required reading for the untrained medical librarian.

Chapter headings include: Libraries and the Physician, Planning the Library, Budgeting, Selection of Books and Journals, Ordering and Checking, Arrangement and Physical Care of Books and Journals, Library Records, Book Loan Services Available to the Physician, Photoduplication Services, Case Records in the Library, Use of the Physician's Own Library, The Medical Paper, Preparing an Index, and Plan for the Cooperative Organization of a Small Medical Library.

It is the author's hope "that the principles, suggetsions of methods and materials found practical in larger libraries will serve a useful purpose for the physician in the building and care of his own library and the fulfillment of his book need."

Ruth E. Harlamert, B.A., Libr.

ANTISEPTICS, DISINFECTANTS, FUNGICIDES, AND CHEMICAL AND PHYSICAL STERILIZATION. Ed. 2. Edited by George F. Reddish, Ph.D., Sc.D. (Hon.), St. Louis College of Pharmacy and Allied Sciences, St. Louis, Missouri. 67 Illustrations and 134 tables. 975 pp. Price $15.00. Lea & Febiger, Philadelphia. 1957.

This is a technical reference book which is well written and, for the type of work that it is, it is interesting. Much of the history and development of subject material is woven into each chapter. The observations, the methods and the prophecies of our antecedents are interesting and, considering the limitations of their era, the work of Semmelweis, Lister et al is truly amazing.

This work is current and pertinent. It should be available and be used by those responsible for our operating rooms, nurseries and wards. This book should be an asset to those plagued with resistant micrococcal morbidity and mortality. There is a full review of testing methods, antiseptics, disinfectants, preservatives and the physical methods of sterilization.

Daniel R. Kohli, M.D.

HAACK

UNEXPECTED REACTIONS TO MODERN THERAPEUTICS: ANTIBIOTICS. By Leo Schindel, M.D. 146 pp. Price $3.00. Charles C Thomas, Springfield, Ill. 1957.

It is necessary to be reminded occasionally of the shortcomings and real dangers of our present day "wonder drugs." This book does just that in less than 150 small pages. It can be read easily in a few hours. My enthusiasm of anticipation was dampened by the actual reading. It is undoubtedly factually correct and has extensive and apparently complete bibliography. Individual cases and authors' names are cited repeatedly. This would be helpful to the student of this subject but serves to make dull reading for the practitioner who just wants to refresh his memory. Each chapter deals with the development, use and adverse reactions of one antibiotic. In this manner, all the present day antibiotics used clinically are covered. It might have been helpful to have emphasized the value of oral penicillin in cutting down reactions. It was mentioned only in passing. There is a good chapter on antibiotic resistant bacteria which clearly points out the biggest problem in present day therapeutics.

In spite of being startled occasionally by words of British aetiology, and a few for whose spelling I could find no authority, I would say that the book is fairly well worth the time required to read it.

Peter Fisher, M.D.

HYPNOGRAPHY: A STUDY IN THE THERAPEUTIC USE OF HYPNOTIC PAINTING. By Ainslie Meares, MBBS, B. AGR. SC., DPM., Melbourne, Australia. 271 pp. Price $7.75. Charles C Thomas, Springfield, Ill. 1957.

The author gives a brief background of medical hypnosis as it has been traditionally used for the removal of symptoms by suggestion. Since psychoanalysis has entered the field of hypnosis it has greatly changed the concepts of hypnotherapy. In hypnoanalysis the patient verbally ventilates his repressed conflicts. A few years ago Meares found it difficult to get a hypnotized patient to verbally express himself. He gave the patient a pencil. The patient drew many pictures, and, while still under hypnosis, associated these drawings with his childhood conflicts. The author has called this technique "hypnography." Later he discovered that painting with black paint on white paper produced better results than drawing with a pencil.

The book is very well illustrated with hypnography. These resemble the paintings of children and are poor representations of the objects they wish to depict. Sexual conflicts are depicted with the inhibited realism of childhood. These paintings may express any event or events that have taken place from infancy to the present time.

One can well agree with the author that hypnography is a rather complicated procedure and requires both experience in hypnosis and real understanding of the dynamics of psychotherapy. It is a technique in which the prime aim is to help the patient to achieve insight, but at the same time it involves other mechanisms—suggestion, rapport, and abreaction—which have a therapeutic effect quite independent of insight.

On the whole, the author has done an excellent job in stimulating a keen interest in hypnosis and especially hypnography as an aid in diagnosis and treatment.

John E. Nelson, M.D.

ROENTGEN DIAGNOSIS OF ABDOMINAL TUMORS IN CHILDHOOD. By Charles M. Nice, Jr., M.D., Ph.D.; Alexander R. Margulis, M.D., and Leo G. Rigler, M.D., all from the Department of Radiology, University of Minnesota Medical School, Minneapolis, Minn. 75 pp. Illustrated. Price $4.00. Charles C Thomas, Springfield, Ill. 1957.

This concise book stresses simple x-ray techniques used to make possible anatomic localization of tumors. Chapters cover: masses in the region of the liver; other intraperitoneal masses (including spleen, mesenteric and omental cysts, lymphangioma of the

(Continued from page 405)

mesentary, alimentary duplication cysts, muconium ileus, ovarian tumors, intussusception, appendiceal abscess and subphrenic abscess); renal and adrenal masses; and other extraperitoneal masses. Where possible, clinical and x-ray findings are pointed out so that a specific diagnosis can be made.

Pertinent publications are correlated with the authors' wide experience. A logical presentation follows which reviews and summarizes the diagnostic possibilities of abdominal tumors in childhood.

Many radiographs are reproduced, illustrating the method of arriving at the anatomic location of masses. Diagrams or retouching some pictures would help give a clearer and sharper idea of the problem under consideration.

The book's interest would be enhanced if the authors had listed the abdominal tumors in children that have been seen at the University of Minnesota and if they had given their "batting average" in making the diagnosis. Some tumors are listed as "not rare" and then it states that 200 or so tumors have been described in world literature. In some of these instances the authors' perspective of relativity seems to be somewhat out of balance. Closer editing would have improved some passages.

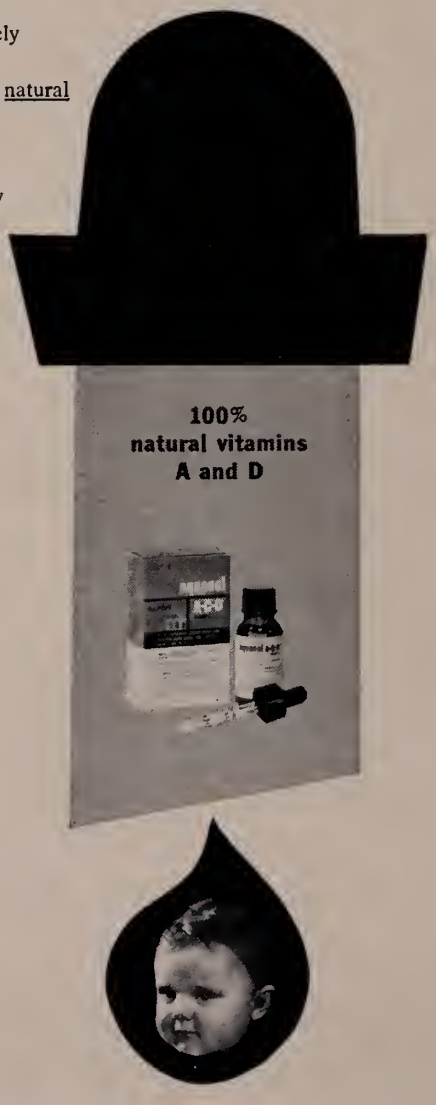
David P. Christie, M.D.

ORTHOPEDICS FOR THE GENERAL PRACTITIONER. By William E. Kenney, M.D., formerly Instructor of Orthopedic Surgery, Yale University School of Medicine, New Haven, Conn.; and Carroll B. Larson, M.D., Professor of Orthopedic Surgery and Chairman of Department of Orthopedic Surgery, State University of Iowa, Iowa City, Iowa. 413 pp. 180 illustrations. Price $11.50. The C. V. Mosby Company, St. Louis. 1957.

This is one of the better orthopedic books available today for the general practitioner. The section on congenital defects of orthopedics is excellent. There

natural and aqueous...

Aquasol A-C-D drops



superior activity – provides *all* immediately utilizable physiologically active isomers of natural vitamin A – together with complete natural vitamin D complex, a superior antirachitic.

superior utilization – more rapid and complete absorption assured by providing oily vitamins in *aqueous* solution.

superior in taste – an exceptionally delicious candy-like flavor – free from fish taste or odor.

superior toleration – specially processed to remove allergenic and non-vitamin factors of fish liver oil.

superior convenience – mixes readily with milk or formulas; may be given with foods or directly on tongue.

Each 0.6 cc. of Aquasol A-C-D Drops provides:

Vitamin A* (natural) . . . 5000 U.S.P. Units

are a few of the more common everyday fractures that are seen by the general practitioner, and many times treated by the general practitioner, that could possibly be just a little better covered—as type of treatment. The authors are weak in this point as to illustrations of treatment.

One of the nicer things about the book is that it is taken up in sections such as the shoulder, the knee, the back, and most of the pathologic, non-traumatic and traumatic diseases are covered in a running account under the proper sections. It does not leave you searching from one portion of the book to another, as the listing is anatomic rather than by disease.

This book is well worth the money and should be used by the majority of general practitioners.

Maurice E. Bryant, M.D.

SEX PERVERSIONS AND SEX CRIMES. By James Melvin Reinhardt, Ph.D., Professor of Criminology, University of Nebraska, Lincoln, Nebraska. 340 pp. Price $5.50. Charles C Thomas, Springfield, Ill. 1957.

The subject of this volume is not noted for characteristics of clarity, factuality or ease of investigation, but the premise that there is need for these to be attained seems quite valid. Therefore it is disappointing when this book fails to answer this need. It is discouraging to find that indeed it wanders inconclusively and in prolix confusion. It is disastrous to think that such a volume would be written "primarily for law enforcement officers, investigators, judges and prosecutors."

With the exception of chapter 13 in which the author details several brief case histories, the book appears to be without merit. Organization is lacking; documentation often at the level of newspaper clippings; definition hazy and style jumbled.

Though sex is here to stay, I doubt if this particular volume is.

Paul Alexander, M.D.

* * * * *

This book, "written for law enforcement officers, investigators, judges and prosecutors," could serve none of them any very useful purpose. The author seems to take every point of view: organic, hormonal, psychologic and psychocultural (whatever that is) but unfortunately does not drive home his main sociologic thesis. By the same token, he gives no clear view of perversions or sex crimes. Frequently, at the point where one would expect an answer or explanation he goes off into vague or trite statements.

Although there is a fair amount of factual material and even some clear thinking in places, the total adds nothing of value to the literature. Actually, with headings such as "The Flame of Passion" and "The Sorrowful Sodomist" followed by long and unedifying case histories, he seems to be appealing through sensationalism. I could forgive him that if he had done a good job of it. I do not recommend the book for anyone.

Robert L. Worthington, M.D.

URINE AND THE URINARY SEDIMENT; A PRACTICAL MANUAL AND ATLAS. Ed. 2. By Richard W. Lippman, M.D., Fellow of John Simon Guggenheim Memorial Foundation. 140 pp. Illustrated. Price $8.50. Charles C Thomas, Springfield, Ill. 1957.

This publication presents in attractive format a mass of readable information easily misconstrued as being "the last word" on the urinary sediment . . . perhaps. I would like to believe that this is merely the author's effort to find the last word. It is an excellent effort and the result is pleasurable. There are several areas where differences of opinion may exist. The possibility of such differences are quite honestly and fairly pointed out by the author in his forward.

In checking a reference to febrile albuminuria, I question the validity of the statement: "The most common cause of proteinuria is fever." The reference reports an increase in quantitative albuminuria in a series of 40 patients receiving therapeutic hyperthermia. Gross albuminuria was not present in 75 per cent as quoted. I feel that this particular conclusion is not valid on basis of fragmentary investigation.

The photographic reproductions are beautiful, and these alone make a treasure of clinical reference. There are 36 new color photographs in this second edition, which added to the 56 in the first edition make 92 in all.

I am not competent to review all of the section on technical methods. However, the section on paper chromatography clarifies the recent advances in this field. Within the limits of my technical knowledge, no errata or omissions were present in the section on technique.

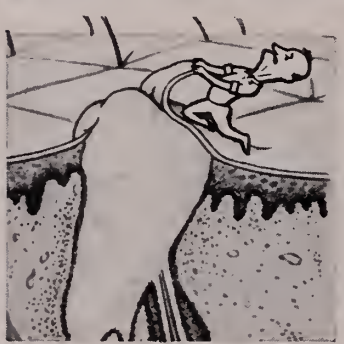
Fostex® degreases the skin and helps remove blackheads



Fostex contains a combination of surface active agents (Sebulytic*) which:

◄ Completely emulsify excess oil so that it is quickly washed off the skin.

◄ Penetrate and soften comedones, unblocking the pores and facilitating removal of sebum plugs.

Fostex dries and peels the skin

◄ The Sebulytic base of Fostex dries and promotes peeling of the skin . . . actions enhanced by the keratolytic effects of micropulverized sulfur and salicylic acid.

*(Sodium lauryl sulfoacetate, sodium alkyl aryl polyether sulfonate, sodium dioctyl sulfosuccinate.)

FOSTEX CREAM
for therapeutic washing of skin in the initial phase of acne treatment, when maximum degreasing and peeling are desired.

FOSTEX CAKE
for maintenance therapy to keep skin dry and substantially free of comedones.

Fostex is easy for your patients to use

◄ Patients stop using soap on affected skin areas. Instead they use Fostex for therapeutic washing of the skin. The Fostex lather is massaged into the skin for 5 minutes—then rinse and dry.

Menne Honored in Retirement

More than two hundred of his friends assembled at the Aero Club, Portland, February 17 to honor Frank Menne and wish him well in his retirement to his native Wisconsin. Tangible evidence of their regard was announced toward the end of the ceremonies when toastmaster, Jeff Minckler, presented to Dr. and Mrs. Menne the title and keys to an automobile. Their daughter, Ann, had come from Wisconsin to be with them on the occasion.

Joseph Nohlgren was chairman of the committee which arranged the dinner. Speakers included Dr. Nohlgren, Warren Hunter, Charles Holman, Isador Brill, John Raaf, Arthur Rogers, Eugene Rockey, Joseph Spendlove, and Edward St. Pierre. All expressed regret upon losing Dr. Menne from the community and all noted his many contributions both profesional and personal. Humor had its day also, particularly from the toastmaster. Few speakers escaped his good natured barbs and several were the subject of pointed rhymes. Dr. Menne's response was a mixture of warm gratitude plus a few samples of the humor for which he is well known.

Remarks of two of the speakers are quoted below:

Remarks by Dr. Holman

"It is my privilege to represent the Dean and Faculty of the University of Oregon Medical School this evening. Among all of us here there is no one who looks forward too happily to the prospect of Dr. Menne's retirement and removal to distant Wisconsin. However, to those of us primarily interested in medical education, its past progress and its future, an occasion of this kind can be a most heart-warming and encouraging experience. As you know, Dr. Menne joined the faculty of the University of Oregon Medical School in 1916 and continued as a full-time faculty member for 28 years until 1944, fourteen years of that time as Professor and Head of the Department of Pathology. He has been an important and valuable member of the faculty on a volunteer basis from 1944 until the present time. This occasion gives us an opportunity to reflect on the tremendous progress of the medical school and the important role played by one individual in the successes that have been achieved.

"We know that it is important to a medical school to have adequate facilities and financial support if it is to progress. However, we also know that the most important factor in the quality of education received by medical students and in the school's contributions to scientific progress is the quality of its faculty. The status of the University of Oregon Medical School in these respects is vastly different today than it was in 1916. The chief reason it is different is because of the contributions made by men of vision and ability, dedicated to the principles of medical education through past years.

"I know of no one who has participated more effectively in the development of the basic teaching programs during the important years of the school's advancement than Frank Menne. The effectiveness of his participation has not been restricted to his knowledge of curriculum arrangement and content and the techniques of imparting scientific information to medical students, but has extended to the many other tremendously important characteristics essential in a physician which the skillful instructor imparts to his students chiefly by example. These include such characteristics as devotion to the welfare of others and to the ideals of medicine, and the development of an inquiring and discriminating curiosity which makes a student of the physician for the rest of his days.

"We take for granted many of the features of our present educational program, but let me remind you that many of these things were unheard of and largely unthought of in 1916 when Dr. Menne came to the University of Oregon Medical School. Dr. Menne introduced the clinical pathologic conference to the Medical School and this area. He instituted the first residency in pathology. Before that time he started the student assistant program in pathology in which a number of students not only learned the basic elements of pathology, but by their relationship with Dr. Menne were inspired with the ideals that have made them leaders in their respective fields of practice. You know that many medical schools, including ours, have affiliations for teaching purposes with Veterans Administration Hospitals through the Dean's Committee arrangement. This is a relatively recent development. Previously the policy of the Veterans Administration strongly disapproved such a relationship. During that period Dr. Menne was instrumental in gaining access for students to the Portland Veterans Hospital for selected teaching activities. This was the first time students were allowed access to the local Veterans Hospital and may well have been the first in any Veterans Hospital. He was a member of many important faculty committees during years when much of the basic groundwork was laid for the development of our modern medical education program. Dr. Menne's contributions were not

(Continued on page 410)

(Continued from page 409)

dependent on his knowledge of medical education alone. They were greatly enhanced by his warm and friendly personality, by his imagination, by his ability to effect an harmonious working relationship among his associates and by his ability to command the loyalty and respect of his assistants.

"A few days ago while discussing Dr. Menne's plan to move to Wisconsin, Dean Baird said, "Of all the members of the medical profession in the city of Portland, none would be missed as much, should be choose to leave this area, as Frank Menne."

"Dr. Menne, we all feel the same way and I hope you don't expect to get us out of your hair by moving a few thousand miles away because we still expect to call for your assistance and counsel in the future as we have in the past."

Remarks by Dr. Hunter

"To you who are young, forty-three years—nearly half a century—must seem a long time to have practiced medicine; but to others of us, including our honored guest, it is hardly more than a "watch in the night", so fleeting is time as one grows older.

"A few weeks from now will mark the self-designated end of a long, productive, honorable and happy professional career having its beginning when Frank R. Menne left the family farm near Fond du Lac to enroll as a premedical student in the University of Wisconsin, at that time offering only the first two years of medicine. Transferring to Rush Medical College in Chicago was a fortuitous circumstance for it led to a student assistantship under the eminent Edwin R. LeCount and close association with the equally noted Ludvig Hektoen. Under such inspiring tutelage it is no wonder that Frank Menne became a pathologist.

"It may surprise some of you to learn that when Dr. Menne came to the University of Oregon Medical School in 1916 he was, next to the late and revered Robert L. Benson, the only other trained pathologist in Oregon.

"The end of World War I saw the beginning of the phenomenal growth of the medical school and in this period of expansion Dr. Menne had many important roles, especially after he became Head of the Department of Pathology in 1929 and until his resignation in 1944 to direct the laboratories of St. Vincent's Hospital. It has been gratifying *to me* to have my former cheif continue as Clinical Professor from 1944 until the prcsent moment. During the years at St. Vincent's he has continued to teach surgical pathology to our students to serve on faculty committees and perhaps most importantly, has furthered medical education at all levels through his wisdom and leadership as Chairman of the Sommer Memorial Lectures which have brought so many eminent speakers to the Alumni Association and Oregon State Medical Society Meetings and to others held at St. Vincent's Hospital. Now, he has chosen to lay aside the multitude of professional duties and to return to his native Wisconsin in order to be near his daughter, Ann, her children and the still-surviving brothers and sisters.

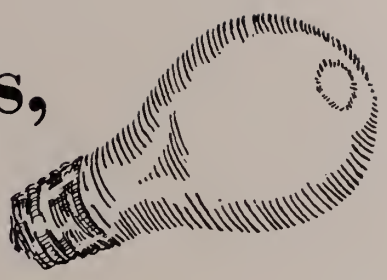
"The preceding paragraphs are not intended to do more than sketch the highlights of our honor guest's professional and civic activities and do not begin to say what all who know Frank Menne would want to voice on an occasion such as this. Others well qualified by long and close contact with Dr. Menne will touch upon a number of these facets. Perhaps my 24 years of close association with Dr. Menne, first as a student assistant and later as a colleague in the Pathology Department, qualifying me to voice the words that any of the host of frienas would want to say were they standing here.

"First, I should like to mention some of the professional attainments of the man we honor. In medical school we obtain only currently acceptable basic education. Once graduated we are on our own; self-education is obligatory if one keeps up with the ever-advancing frontiers of knowledge. When Dr. Menne came into medicine the monumental changes wrought by bacteriology, immunology and prevention of a number of infectious diseases, together with a full understanding of the pathology of these diseases had largely been attained. The near half-century marking his own active part in medicine has witnessed even more astounding changes; insulin treatment of diabetes, the alleviation and control of infectious diseases first by the sulfonamides and later by the antibiotics, the vastly improved outlook in tuberculosis via antibiotics and surgery, the successful surgical attack upon the circulatory system, the better recognition and treatment of cancer; the use of isotope tracers to ferret out many hitherto hidden secrets of physiology and disease, to mention only some of the more important new things that have come into being. The challenge of continued education has been met by Dr. Menne personally and we honor him for it.

"He is to be credited with two enduring contributions toward the understanding of common and important disease processes, both coming at a time when chaotic thinking reigned. I refer to his clinico-pathologic classification of goiter in collaboration with the late Thomas M. Joyce and equally valuable study of bronchogenic carcinoma in conjunction with the late Marr Bisaillon. To this day, these sound concepts serve me well.

"Thirty-seven years ago the Coroner of Multnomah County first contracted with the medical school to perform autopsies and possibly this dates the beginning of Dr. Menne's long interest in legal medicine, at that time even more neglected than now and a field in which few doctors in the state were fitted to participate. Through your interest, knowledge and energy you aided materially in the solution of many crimes locally and in the Pacific Northwest. To you belongs the credit for initiating the Crime Detection Laboratory of the Oregon State Police. Through your wide acquaintance with district attorneys, sheriffs, and coroners you were able to establish the value of the autopsy and other scientific means of the solution of crime in this state. Not without reason were you invited to attend the meetings of these law-enforcement organizations and made an honorary member of some of them.

"A tenet of ancient Greek medicine charged every physician with the duty of teaching others who wished to learn the healing art and no greater privilege or responsibility can be laid upon one than this. Knowledge is the sine qua non of the teacher but without other priceless ingredients the teacher will fail. Contagious enthusiasm, a zeal for the truth, ability to speak and to write well, patience, understanding and a genuine liking for the student as a person are among the qualities that go to make a successful teacher. I know of no one who meets all of these criteria better than does Dr. Menne.



"Early in my association with Dr. Menne other qualities than those just mentioned became apparent and were manifested in his relationships with all who became student assistants and residents. Always he stood ready to encourage and to stimulate us to do better work, to praise when praise was due, to use the rod lightly when necessary. Above all was the bigness and generosity of his soul, absolute professional courtesy and fairness so often manifest by his custom of mentioning the names of younger associates before his own in speaking of scientific accomplishments. His great desire was to see us grow in knowledge and into responsibility as rapidly as we were able to do so. I am grateful indeed for having been brought up in such a scientific climate. To my personal knowledge many others share this feeling.

"Finally, I shall attempt to pay tribute to a facet of Dr. Menne that every one knows, appreciates and loves, namely that universally recognized, but difficult to describe, something in one's personality that attracts and makes warm, enthusiastic and enduring friends. His native German best sums this up in the noun Gemütlichkeit, meaning "good nature, geniality, comfortableness," Dr. Menne possesses all of these qualities to the highest degree. In any group his presence has always meant that friendliness and good humor reigned; as a host on any occasion he was always superb.

"Dr. Menne, we shall miss you, but our memories of all that we have liked so much about you will remain undimmed. We wish that many years of good health and happiness will be yours to enjoy."

A Pod of Peas,

A Light Bulb...

And You

STUDENTS OF GENETICS will immediately recognize Mendel's beloved sweet pea. For it is the very symbol of the patient monk's laborious study, the results of which immeasurably enriched man's knowledge of himself. Long years of tedious toil, patient research interrupted by countless failures: these, too, were the lot of Thomas Edison, whose diligence and perseverance reached fruition in the first practical incandescent light bulb. He tested over 1,600 substances before finding a material which would function properly as a filament for his lamp. Yet Edison never considered these as failures, but as stepping-stones to success.

Behind man's every endeavor lies research, a valuable tool in the quest for scientific truth. In the search for the cause and cure of alcoholism too, research is indispensable, for this end can be realized only through critical and exhaustive investigation and experimentation. Therefore, Shadel continues to offer you, from 23 years of operation, research information gathered and developed by experienced specialists and technicians from over 10,000 patients which it has had the opportunity to serve.

PRACTICE OPPORTUNITIES

EXCELLENT GP OPPORTUNITY

Ten-bed hospital, full office equipment and living quarters in same building. Two x-ray machines, one a multiplane Westinghouse. If wife is a nurse, could operate a resthome or hospital. Your inspection invited. Name your own terms. Contact L. J. Stauffer, M.D., Priest River, Idaho.

INTERNIST WANTED

Board eligible internist wanted for private practice associated with established specialists. Suite for lease. Opportunity to share building and laboratory ownership. Prosperous growing Pacific Northwest City. Write Box 44-A, Northwest Medicine, 1309-7th Ave., Seattle, Wash.

INTERNAL MEDICINE PRACTICE FOR SALE

Internist or generalist with training in internal medicine wanted to assume practice of internal medicine. Progressive city of 32,000. Excellent hunting and fishing. Grossed over $30,000 in 1957, third year of practice. Asking $2,000 without equipment. Terms possible. Available now. Contact John W. Christerson, M.D., 4036 So. Sixth Ave., Klamath Falls, Oregon.

EXCELLENT GP OPPORTUNITY

Home-office combination for sale at Priest River, Idaho. Very reasonably priced. Full office equipment, including 50 ma Westinghouse X-ray. New hospital 7 miles away at Newport, Wash. Physician in service; town very anxious for replacement. Contact Mr. Dick Sonntag, Priest River or Capt. H. G. Lawson, USAH, Dugway, Utah.

PSYCHIATRIST WANTED BY VA HOSPITAL

Veterans Administration Hospital, 630 beds, has opening for psychiatrist or physician interested in psychiatry. Salary, depending on training and experience, up to $10,320 with 25 per cent extra allowance if board certified. Write: Manager, Veterans Administration Hospital, Roseburg, Oregon.

OPPORTUNITY FOR GENERAL PRACTITIONER

Only physician in large rural area, Northwestern Washington. Drawing area of 15,000. Very commodious office space, adequate equipment, comfortable furniture. Reasonable terms. Write Faith Funk, R.N., Everson, Washington.

SPECIALISTS NEEDED

An ophthalmologist and an otolaryngologist are needed in this town and district immediately. Area is growing. Due to retirement, furniture and equipment for sale. Contact Bernard Barkwill, M.D., Box 147, Coos Bay, Oregon.

OPPORTUNITY FOR GENERAL PRACTITIONER

GP group practice with four other GPs; 30 miles from Seattle. Snoqualmie Valley Clinic, Snoqualmie, Wash. Phone 88-3352.

CLINICAL DIRECTOR FOR REFORMATORY

Physician needed immediately to act as clinical director of Reformatory at Monroe. Involves complete responsibility for all phases of medical program. Starting salary $9552-$11,400, depending on qualifications. Full information on request. Contact Washington State Personnel Board, 212 General Administration Building, Olympia, Wash.

LOCATIONS DESIRED

INTERNIST DESIRES LOCATION

Internist wishes position in or near Seattle. Board eligible. Recently completed residency. Age 44. Wide background in general practice. Consider any position in internal medicine or closely allied field. Contact R. L. Longanecker, M.D., HOlly 0185, 5437 Beach Drive, Seattle, Wash.

MEDICAL OFFICE SERVICES

SPECIALIZING IN MEDICAL ACCOUNTS

Excellent experience in medical office methods and accounting. Service includes full bookkeeping, billing, taxes and collection—tailored to fit your needs. Medical references available. Limited to King County. Call Mr. Ellis, WAbash 3751, Seattle, Wash.

PLACEMENT BUREAUS

PHYSICIANS AND SURGEONS REGISTRY

If interested in re-locating, joining a group or in disposing of equipment and practice, contact us. Services strictly confidential. Continental Medical Bureau, 510 West 6th Street, Los Angeles 14, or Pacific Coast Medical Bureau, 703 Market Street, Room 1404, San Francisco 3.

EQUIPMENT FOR SALE

HOSPITAL EQUIPMENT FOR SALE

Complete, older but adequate, 25-bed hospital equipment at fraction of replacement cost. Ideal for small private or community hospital or nursing home. Write or call R. L. Longanecker, M.D., HOlly 0185, 5437 Beach Drive, Seattle, Wash.

OFFICE SPACE

NEW MEDICAL OFFICE FOR LEASE

Office space of approximately 550 sq. ft. on ground floor. Will tailor to suit specifications. Reception room to be shared with dentist. Excellent parking lot. Thriving community. Contact Mr. J. E. Jones, MYrtle 2-2112, Route 1, Box 25, Silverdale, Wash.

GP OFFICE AND EQUIPMENT FOR LEASE

Completely furnished and equipped medical office for lease. Ground floor. Adequate parking. Busy suburban area in Seattle. Available immediately. Write Box 37-A, Northwest Medicine, 1309-7th Ave., Seattle, Wash.

MEDICAL OFFICE FOR LEASE

New medical office with 800 sq. ft. located at Kenmore near Seattle. Adjoins dental office. Available now. Call GLadstone 3240 or FIlmore 1867, Seattle, Wash.

PHYSICIAN'S OFFICE FOR LEASE

Office for lease in small clinic building located in good suburban district of Seattle. A pediatrician and 2 dentists well-established in building for two years. Have excellent practices. Ample parking. Will offer very low rent until established. Telephone KEnwood 6096 or write 4321 East 41st St., Seattle, Wash.

MEDICAL SPACE FOR LEASE

Excellent opportunity for pediatrician or general practitioner. One unit available in new 4-unit residential Medical-Dental Clinic in Spokane. Share receptionist. Very attractive rental offer to start. Contact Mr. A. K. Sheely, 1319 Old National Bank Bldg., Spokane, Wash.

EQUIPPED MEDICAL OFFICES FOR SALE

For sale at a fraction of replacement cost—completely equipped medical offices in 47 year established location, former St. Maries Hospital; building has other possibilities. Write or call Ray A. Bowen Agency, CHerry 5-3471, St. Maries, Idaho.

BUY OR LEASE MEDICAL SPACE

Opportunity to buy or lease in Medical Dental Center, to be built to your specification. Fast growing suburban area in S.E. Southgate district, Portland. Contact Mr. Roy Van Pelt, York Realty, 401 S.E. 81st Avenue, ALpine 4-1774, Portland 15, Oregon.

In Asthma

PRE-MICRONIZATION of particle size assures maximum effectiveness

Medihaler-EPI®

For quick relief of bronchospasm of any origin. More rapid than injected epinephrine in acute allergic attacks.

Epinephrine bitartrate, 7.0 mg. per cc., suspended in inert, nontoxic aerosol vehicle. Contains no alcohol. Each measured dose 0.15 mg. free epinephrine.

Medihaler-ISO®

Unsurpassed for rapid relief of symptoms of asthma and emphysema.

Isoproterenol sulfate, 2.0 mg. per cc., suspended in inert, nontoxic aerosol vehicle. Contains no alcohol. Each measured dose 0.06 mg. free isoproterenol.

MEDIHALER® *For Ample Air Right Now!*

Millions of asthmatic attacks have been aborted faster, more effectively, more economically with Medihaler-Epi and Medihaler-Iso. Automatically measured dosage and true nebulization...nothing to pour or measure...One inhalation usually gives prompt relief.

Prescribe Medihaler medication with Oral Adapter as first prescription. Refills available without Oral Adapter.

The Medihaler Principle of automatically measured-dose aerosol medications in spillproof, leakproof, shatterproof, vest-pocket size dispensers also available in Medihaler-Phen® (phenylephrine, hydrocortisone, phenylpropanolamine, neomycin) for prompt, **lasting** relief of nasal congestion.

NEW

HYPAROTIN*

Mumps Immune Globulin (Human)

when mumps endanger men

Superconcentrated
The mumps antibody content of Hyparotin (165 mg. gamma globulin per cc.) is eight times that of the usual immune serum globulin and twenty times that of human mumps immune serum.

Safe
Smaller dosage made possible by highly concentrated Hyparotin minimizes tissue distension. No serious reactions or transmission of homologous serum jaundice have ever been reported.

1. Gellis, S. S., McGuinnes, A. C., and Peters, M.: Am. J. M. Sc. *210*:661, 1956.
2. Bowers, D.: West. J. Surg. *61*:72, 1953.
3. Editorial: New England J. Med. *256*:1066, 1957.

HYPAROTIN provides effective prophylaxis against mumps and its complications.

Prevents Orchitis
To prevent orchitis, the minimum suggested dosage of mumps immune globulin following exposure is 3 to 4.5 cc. according to weight and delay. After the onset of mumps symptoms, massive doses should be administered as soon as possible for greatest effectiveness.[1]

In Pregnancy
Recent studies raise the question that mumps during pregnancy may result in congenital defects of the newborn.[2,3] Although no specific protective or therapeutic action can be assured, Hyparotin may be useful in avoiding such abnormalities.

Hyparotin is prepared from the plasma of venous blood from human donors hyperimmunized with mumps vaccine.

SURELY a most versatile and vital instrument in any surgeon's list of equipment is the scalpel. Even in the mind of the layman the scalpel is associated with the skill of the surgeon as is the brush with the artist and the pen with the writer — a necessary adjunct to the ability with which he operates. The shining blade, the steady hand; each is a complement of the other. But the pen, the brush and the scalpel are of little value without an understanding of their possibilities and a firm grasp of their utmost potential.

Napoleon aptly phrased it when he said: "The tools to him that can handle them." A hospital too, in a sense, is a tool of the successful physician; a specialized piece of equipment as necessary as the surgeon's scalpel and providing even greater potential. For this very reason Shadel offers you, the physician, its services. By taking advantage of them in dealing with the problem of alcoholism you, and your patients, will benefit and you will add to your equipment a valuable implement.

NILEVAR FOR PROTEIN TISSUE BUILDING

Protein Deficiency, a Hazard in Surgical Patients, Reversed with Nilevar®

With surgery made safe for the patient, the patient may now be made safe for surgery.

Patients about to undergo extensive surgery[1] frequently have negative nitrogen balance and protein deficiency. And after any severe trauma, including extensive surgery, the rate of protein breakdown is increased.

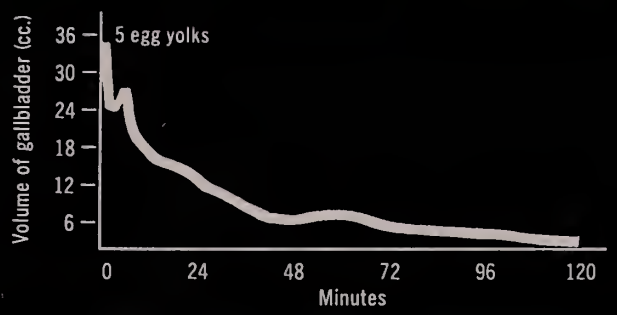
It is also well recognized that patients with a strongly negative nitrogen balance are much more prone to suffer delayed wound healing[2], secondary infections[3], shock[2] and delayed convalescence[4].

The need for an effective protein anabolic agent is stated by Moore and Ball[5]—"there is one unbreakable rule of surgical convalescence: to complete his recovery, regain strength and return to work the patient *must* come into positive nitrogen balance."

Nilevar (brand of norethandrolone) is a new anabolic steroid which rapidly and effectively reverses or diminishes excessive protein catabolism and nitrogen loss accompanying major surgical procedures. The protein anabolic activity of Nilevar is specific. There are usually minimal or no androgenic side effects.

In addition to its use both preoperatively and postoperatively, Nilevar is indicated in all conditions in which excessive protein catabolism (nitrogen loss) hinders or delays convalescence:

Recovery from pneumonia, poliomyelitis, severe burns and fractures, and in the care of premature infants, decubitus ulcers and wasting diseases such as cancer and tuberculosis.



The daily adult dose is three to five Nilevar tablets (30 to 50 mg.). For children the daily dosage is 1 to 1.5 mg. per kilogram of body weight for the first ten days of treatment, after which the daily dosage should be reduced in all prepuberal patients to 0.5 mg. per kilogram of body weight. Individual dosages depend on the need for and the response to therapy. G. D. Searle & Co., Chicago 80, Illinois. Research in the Service of Medicine. References supplied on request.

AN AMES CLINIQUICK

CLINICAL BRIEFS FOR MODERN PRACTICE

"EMPTYING" OF GALLBLADDER AFTER FATTY MEAL*

*Adapted from Wright, S.: Applied Physiology, ed. 8, London, Oxford University Press, 1947, p. 734.

What's wrong with the term "emptying of the gallbladder"?

The gallbladder discharges bile by fractional evacuation. It is not emptied completely at any one time even following a fatty meal.

Source—Lichtman, S. S.: Diseases of the Liver, Gallbladder and Bile Ducts, ed. 3, Philadelphia, Lea & Febiger, 1953, vol. 2, p. 1177.

'DIURIL'

(CHLOROTHIAZIDE)

in

EDEMA

Start therapy with one or two 500 mg. tablets of 'DIURIL' once or twice a day.

BENEFITS:

- The only orally effective nonmercurial agent with diuretic activity equivalent to that of the parenteral mercurials.
- Excellent for initiating diuresis and maintaining the edema-free state for prolonged periods.
- Promotes balanced excretion of sodium and chloride—without acidosis.

Any indication for diuresis is an indication for 'DIURIL':

Congestive heart failure of all degrees of severity; premenstrual syndrome (edema); edema and toxemia of pregnancy; renal edema—nephrosis; nephritis; cirrhosis with ascites; drug-induced edema. May be of value to relieve fluid retention complicating obesity.

SUPPLIED: 250 mg. and 500 mg. scored tablets 'DIURIL' (chlorothiazide); bottles of 100 and 1,000.

'DIURIL' and 'INVERSINE' are trade-marks of Merck & Co., Inc.

MSD MERCK SHARP & DOHME

Division of MERCK & CO., Inc., Philadelphia 1, Pa.

as simple
as 1-2-3
in

HYPERTENSION

1 INITIATE 'DIURIL' THERAPY

'DIURIL' is given in a dosage range of from 250 mg. twice a day to 500 mg. three times a day.

2 ADJUST DOSAGE OF OTHER AGENTS

The dosage of other antihypertensive medication (reserpine, hydralazine, etc.) is adjusted as indicated by patient response. If the patient is established on a ganglionic blocking agent (e.g., 'INVERSINE') this should be continued, but the total daily dose should be *immediately* reduced by 25 to 50 per cent. This will reduce the serious side effects often observed with ganglionic blockade.

3 ADJUST DOSAGE OF ALL MEDICATION

The patient must be frequently observed and careful adjustment of all agents should be made to determine optimal maintenance dosage.

BENEFITS:

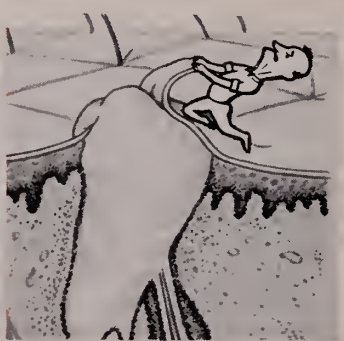
- improves and simplifies the management of hypertension
- markedly enhances the effects of antihypertensive agents
- reduces dosage requirements for other antihypertensive agents—often below the level of distressing side effects
- smooths out blood pressure fluctuations

INDICATIONS: management of hypertension

Smooth, more trouble-free management of hypertension with 'DIURIL'

IN ACNE

Fostex® degreases the skin and helps remove blackheads



Fostex contains a combination of surface active agents (Sebulytic*) which:

◂ Completely emulsify excess oil so that it is quickly washed off the skin.

◂ Penetrate and soften comedones, unblocking the pores and facilitating removal of sebum plugs.

Fostex dries and peels the skin

◂ The Sebulytic base of Fostex dries and promotes peeling of the skin . . . actions enhanced by the keratolytic effects of micropulverized sulfur and salicylic acid.

*(Sodium lauryl sulfoacetate, sodium alkyl aryl polyether sulfonate, sodium dioctyl sulfosuccinate.)

FOSTEX CREAM
for therapeutic washing of skin in the initial phase of acne treatment, when maximum degreasing and peeling are desired.

FOSTEX CAKE
for maintenance therapy to keep skin dry and substantially free of comedones.

Fostex is easy for your patients to use

◂ Patients stop using soap on affected skin areas. Instead they use Fostex for therapeutic washing of the skin. The Fostex lather is massaged into the skin for 5 minutes—then rinse and dry.

SANDOZ

CORRESPONDENCE

Standards

Spokane, Washington

EDITOR, NORTHWEST MEDICINE:

I have particularly enjoyed the February issue, possibly because there is a number of well written articles, with subjects in which I am interested. There is, however, one thing on which I think we should insist, in our articles, and that is that an indication be given of where the work which is reported is carried out and by whom. For example, in the article on arterial aneurysms the author obviously has not done 114 aneurysms in Tacoma since his arrival there, and it would be interesting to know whether these are all his own cases or cases on which he collaborated with other men. I assume, since he does not indicate otherwise, that they are his own. However, I think it makes a great deal of difference because one would assume, if one did not think about it, that they were done in his present hospital, but I doubt very much if this is the case. I think it is very important to know whether these operations are carried out under the conditions which exist in a local community hospital or whether they are carried out at a big University hospital, such as the one in Minneapolis where I gather he had his previous experience. When one reports an article on pure research, one always carefully at the begining of the article describes material and methods and the conditions under which the experiment was carried out, and I think in clinical research the source of material and some details regarding where, when and by whom it was carried out, should be included in the presentation of material. Otherwise, its evaluation is very difficult.

I do not mean this as criticism of the article because it certainly represents a tremendous experience, with an enviable mortality and morbidity.

With kindest regards, I am

Sincerely,
C. P. Schlicke, M.D.
Editorial Advisory Board
Tacoma, Washington

° ° °

EDITOR, NORTHWEST MEDICINE:

This is in response to the question raised in Dr. Schlicke's letter.

In the presentation of the article, Surgery of Major Arterial Aneurysms, a great deal of the clinical material was drawn from my experience at the University of Minnesota Hospitals while I was a supervisor of vascular surgery at the Mineapolis General Hospital and the University Hospitals. The 114 arterial aneurysms presented in this manuscript were drawn from date accumulated during my tenure in these hospitals as well as from private practice in the Tacoma, Washington, area. However no aneurysms were included in this series which had not had at least a four months postoperative follow-up at the time of writing the manuscript, for obvious reasons. The experience is by and large a personal one in that the patients were either operated upon by myself or immediately supervised by myself, assisting one of my surgical residents.

In this particular manuscript I was reluctant to enlarge upon the topic of recommending such major surgery including the use of the pump oxygenator in a local community hospital, primarily for the reason that those who advocate such procedures must accept some of the responsibility in doing so. At this time the establishment of facilities for extra corporeal circulation, a cardiac catheterization laboratory and facilities for performing major cardiovascular surgery in local community hospitals is more or less on an experimental basis. In the last eight months 23 such procedures of a major cardiovascular extent, largely arterial aneurysms including thoracic aneurysms using extra corporeal circulation, have been performed. There have been two deaths associated with these procedures. In one the patient expired 24 hours after the removal of a ruptured abdominal aneurysm, having undergone a long period of shock in the pre-operative interval. The second patient expired of a massive cerebral vascular accident on the fifth post-operative day following the resection of an abdominal aortic aneurysm.

I feel that the entire topic of the advisability of extending major surgery involving complicated techniques, multiple trained physicians and extremely complicated nursing service into the community hospital is one that must be performed as a pilot experiment and that a thorough evaluation of the results of these efforts may well be presented sometime in the future.

Very sincerely yours,
Thomas O. Murphy, M.D.

Legal Opinion on Publication of Case Records

American Medical Association
535 North Dearborn Street
Chicago 10, Illinois

EDITOR, NORTHWEST MEDICINE:

Dr. Austin Smith has asked me to answer your letter to him dated February 26, in which you referred to an article which appeared in the February 15 issue of *The Journal* concerning ownership of and access to hospital records.

Until your letter was received it did not occur to me that there would be any confusion concerning the authorship of that article. Now that I look at *The Journal*, I

(Continued on page 437)

This advertisement is one of a series by the Council for Advancement of the Privileges of Medicine. For further information on Child Health

(Continued from page 435)

see that some confusion might arise. On page 796 of *The Journal* in the column, "Medicine and the Law," there is a heading, "Opinions of the Judicial Council." Immediately following this heading there is an italicized statement that the Council has authorized the publication of the following *Opinion*. Actually, the opinion regarding an interpretation of the second sentence of Section 7 of the Principles of Medical Ethics is the only material on that page which emanated from the Judicial Council. It is not made clear that Ownership and Access to Hospital Records is a Law Department article on the legal aspects—not ethical—of ownership and access to hospital records.

Your quotations from the article, again not made by the Judicial Council but by the Law Department, represent the opinion of the Law Department. In our opinion a doctor does have the right to write up his cases. If he should find it helpful or even necessary to refer to hospital records to complete his scientific discussion in the interest of the advancement of science, he should be permitted to do so as long as he does not infringe upon an overriding right of someone else, i.e., the hospital or the patient. It is to be doubted that the hospital's physical ownership of records overrides the right of a physician to promote the advancement of medical science. It is to be doubted that the patient's right to privacy is violated in a write-up of a case when anonymity of patient is maintained.

From the legal point of view, I do not find reason to be concerned if a physician-author publishes a report of cases which may include information from hospital records of hospitals with which the author no longer has connection. I cannot visualize an action being brought for assault, trespass, plagiarism, invasion of privacy or the like, by the hospital, and being maintained successfully, except perhaps in the instance when a cause celebre is being reported and direct reference is made to the hospital and direct quotations are used from its records. I would be inclined to agree with your thought that the doctor-author either quotes from his own personal records or uses the hospital records to "refresh his recollection." Certainly—and again in the interest of medical science—your suggestion that difficulty would be avoided by deleting initials, hospital numbers and the names of hospitals is sound; and as a matter of policy should protect any medical journal.

I trust these comments have been helpful to you.

Sincerely,
Edwin J. Holman

Army Procedure on Publication of Case Records

Department of the Army
Office of the Surgeon General
Washington 25, D.C.

EDITOR, NORTHWEST MEDICINE:

In your letter of 25 February 1958 you raise the question concerning the propriety of publishing a manuscript embodying the experience of a physician, now a civilian, gained while he was serving in the Army.

At present, civilian authors reporting experience gained in the military service are not required to submit material for clearance. Many civilian authors, however, do submit material based on their military experience for review for factual accuracy or security, or both.

The above procedure is a service provided by the Army and is elective on the part of the author. Such review is accomplished by forwarding the material and a letter requesting type of review to:

Chief, Magazine and Book Branch
Office of the Chief of Information
Department of the Army
Washington 25, D. C.

Thank you for your interest in the Army Medical Service in making this inquiry and it is hoped the above information will be of service to you.

Sincerely,
Bryan C. T. Fenton

George Washington stated in 1776 that "It is among the most difficult tasks that I ever undertook in my life to make these people believe that there is now or could be danger until the bayonet is pushed at their breasts."

Today, as in 1776, it takes men of vision to recognize that a threat to National Security exists and to take positive steps to minimize that danger. These men, together with other physicians and the hospital officials of the state, are taking positive steps to: (1) establish a practical area plan for the management of mass casualties, (2) insure that each hospital in the state can double its bed capacity and has adopted and tested an approved disaster plan, and (3) are assisting in the development of emergency hospitals to provide increased bed capacity under disaster conditions.

This definitive planning is making a vital contribution to the security of our state and to our nation, and we therefore pay tribute to these men for their unselfish devotion to the accomplishment of this important task.

Sincerely yours,
Charles C. Ralls

EDITORIAL

Education for General Practice

General practice has been defined many times in many ways. There is no agreement. Failure to agree has led to breakdown in communication, blockade to progress and finally to inability of the medical profession to deliver what it could and should provide for the public. Almost without exception, the definitions of general practice have attempted to describe it as an area. As it exists to a certain extent today, and as it could be under ideal conditions, general practice is not an area but an attitude.

This attitude is not solely the prerogative of the general practitioner. It is apparent in the practice of many specialists, more of whom would be willing to display it except for fear of incurring the wrath of other members of special groups. Some general practitioners do not have the general practice attitude but most possess it because of their experience with people who are ill or distraught or both. Medical care for the latter group does not all come out of a bottle nor is it terminated with an operation or the writing of a prescription. The general practice attitude is a human attitude toward human beings and has little to do with expertness in any field except to augment its application.

The medical profession has been the target of many attacks by politicians, by sensation seeking magazines and by demagogues within the profession. It is currently in the throes of a struggle over closed panel group practice and preliminary skirmishes indicate coming warfare which may well be disastrous. Frequency and severity of these attacks have increased almost in direct proportion to increased ultilization of science and technology in medicine. The attacks have come, not because we have added something new, but because we have forgotten something old.

A sick human being is not an appendix, a gallbladder, a lump in the breast or just a host for the newest virus. Illness does not anesthetize his emotions and no operation, save perhaps prefontal lobotomy, has yet been designed to separate man from his fears and his questions. The fact that he does not express his fears or ask his questions does not mean that they are not there or that they are not doing incalculable harm.

The fear-question part of any illness is seldom discovered when a patient goes through an assembly line of specialists or is referred around town to a variety of practitioners, each of whom is anxious to spend as little time as possible with the patient. Administering to the need of the patient to express his fears and ask his questions is a part of the general practice attitude and it should not be confined to any group. If such an attitude, which is old, could be properly combined with the knowledge of science and technology, which is new, the profession would find itself immune to the attacks of politicians, magazine writers and demagogues. If all physicians could accept the doctrine of individual responsibility of the individual physician to the individual patient, all attempts to destroy the private practice of medicine would fail. The uproar over closed panels such as the Kaiser system and the United Mine Workers Fund, would never have arisen.

Attitudes of those physicians now in practice

might be changed by a well directed campaign conducted by the American Medical Association and such an activity may become necessary if private practice is to be saved. What is more important, however, is to develop proper attitudes at the most impressionable period in the physician's life—while he is in medical school.

It makes no difference whether the student ultimately will engage in what is called general practice or whether his field will be more limited. His attitude should be the same.

There are general practitioners who are skillful surgeons, some who are competent obstetricians, some who are excellent pediatricians and some who are expert cardiologists. It is not likely that any one general practitioner is a skillful surgeon, a competent obstetrician, an excellent pediatrician and an expert cardiologist. Frequently, the only detectable difference between these high grade general practitioners and equally high grade specialists is one of atittude. Undoubtedly, many superior specialists do have the attitude and are able to benefit their patients by rendering care beyond the confines of a narrow field.

Davison, in this issue, presents a program for a general practice department in the medical school. Comments from other educators, published with Davison's article, are uniformly in agreement with his objectives. There is some disagreement with the method suggested. This does not appear to be a serious obstacle to progress. It is clear that much disagreement stems from lack of adequate definition of general practice and particularly from lack of general recognition that it is an attitude more than it is an area. Therefore, it is apparent that Davison does not go far enough. If the general practice attitude is the attitude best suited to carry modern science and technology to the public, without losing the art of our predecessors, it will be necessary to orient the whole school to that attitude. Davison's proposal appears to be a good first step.

The article and comments indicate that those most intimately concerned with medical education have devoted and are devoting a great deal of thought to the problem of how best to teach general practice. There is complete agreement that good general practitioners should be produced but not much agreement on how it should be done. Some would agree with Darley who would look far ahead to determine needs, then build a course to produce the desired type. Others would follow Dimond who wishes to go further, more quickly. He would start afresh, taking the student out of high school into seven years of entirely re-designed education, obviously pointed toward the general practice attitude. There are other veiwpoints not represented in the comments received. It is known that several schools have established departments of general practice or are contemplating such plan. Most encouraging, however, is the fact that there is much discussion and still much disagreement, indicating deep and purposeful interest of all concerned. Progress, not merely change, will appear after disagreement has exerted its stimulating effect on further thought. •

Circulation of Cancer Cells After Surgery

Every surgeon who operates for cancer should read a recent report on the frequency with which cancer cells may be found in the blood stream shortly after operation.[1] It has been known for many years that cancer cells can be found in the blood of some cancer patients. The authors of this report, however, have carried the investigation far enough to make the information significant. It might not be surprising that they found such cells in the blood from 9 of 28 patients with incurable cancer. Of much more import is their finding of the cells in blood from 12 of 72 cases deemed curable at operation.

As the samples of blood in which the cancer cells were identified were only 10 cc. each, and

1. Roberts, S., et al., Technique and results of isolation of cancer cells from the circulating blood, A.M.A. Arch. Surg. 76:334-346, (March) 1958.

as it is probable that cancer dissemination occurs in showers and in clumps, it would not be surprising that the true incidence of free cancer cells in the blood is much higher than reported.

That operating on a cancer is no benign procedure is evidenced by the fact that in 5 of their cases they found no cancer in the blood before surgery and cancer cells were found after operation. One case of carcinoma of the kidney showed a fourteenfold increase of cancer cells in the inferior vena cava postoperatively.

Efforts to prevent the implantation of free cancer cells after operation have been made. I have used mild radiation (800 r) pre-operatively in 10 cases of cancer of the breast. Unfortunately, tissue cultures of the tumors showed no inhibition of growth whatever after radiation.

It is possible that chemical inhibitors of tumor cells might be of real value if given before, during or just after cancer surgery. It also might be wise to develop a two stage technique for cancer surgery. The first stage would be the simple removal of the tumor in the least traumatic manner possible. The second stage would then be the cancer operation for removal of lymphatic spread after the original tumor had been removed. It would then be impossible to inadvertently massage living cancer cells into the blood stream from the primary growth. •

D. M.

Obesity

Those who are not enthusiastic about success in treating obesity will enjoy reading one of the Cornell Conference Reports published in the January 1 issue of *New York State Journal of Medicine*. This is largely a report by Albert Stunkard, Assistant Professor of Medicine at Cornell, who has been working in the field of obesity.

Using the criterion of loss of 20 pounds, he does not find treatment of obesity a very successful procedure. Neither have others been able to reduce more than 30 per cent of their patients by that amount, regardless of the method used. In fact, results seem to be rather uniform in degree of success which leads Stunkard to observe that the only universal element is the doctor-patient relationship. He concludes that the treatment becomes one of psychotherapy with treatment of the patient a great deal more important than treatment of the obesity.

Most obese persons will not continue treatment and of those who do, most will not lose weight. Of those who lose, most will regain what they have lost. Stunkard interviewed 100 patients at his clinic. Only 12 of these succeeded in losing more than 20 pounds during a year of observation and by the end of the period, 4 had regained the loss. Psychosomatic symptoms developed in half of the patients under treatment. These included nervousness, anxiety, restlessness, weakness and irritability.

These discouraging facts led Stunkard to an entirely new concept of his role as a physician in treating obesity. He no longer gives the patient a diet upon starting treatment but waits until the patient insists on a diet or voluntarily begins to reduce his food intake. Then the diet is given simply as a guide to prevent malnutrition. He has decided that psychotherapy is simply the influence exerted on the patient by the physician through psychologic means. Such influence is part of the physician-patient relationship and has its place in any treatment, including treatment of obesity.

Stunkard found that embarrassment over failure to lose weight caused most of his patients to discontinue their visits. This was further reason to assure the patient that the physician's interest was in the patient, regardless of the outcome of his dieting. The same factor applies in those who do succeed in losing weight. Many explained their failure to maintain weight reduction by stating that the physician seemed to lose interest after they had reached the predetermined goal.

Other factors were discussed in the report but the most interesting and by far the most significant influence in the obesity problem appears to be the one so important in many other conditions. The physician who is more interested in his patients than in their diseases seems to get the best results. •

routine checks verify clinical accuracy

Every lot of 'Tes-Tape' (Urine Sugar Analysis Paper, Lilly) is subjected to a panel of ten persons at the Lilly Research Laboratories who are unfamiliar with the use of 'Tes-Tape.' Each panel member examines twenty-five urine specimens containing different concentrations of glucose. When last computed, the average accuracy of the observations at the designated levels was as follows:

Glucose Concentration	Accuracy
2 percent	98.6 percent
0.5 percent	88.9 percent
0.25 percent	90.3 percent
0.1 percent	95.6 percent
0 percent	100 percent

A total of 5,500 different specimens were assayed, with an over-all accuracy of 98.6 percent.

Available at all pharmacies in plastic dispensers of approximately 100 tests.

ORIGINAL ARTICLES

The Medical School Department of General Practice

ROBERT A. DAVISON, M.D.
MEMPHIS, TENNESSEE

It is with deep appreciation that I have accepted your gracious invitation to speak to you on one of the most controversial topics in medical education today. It is a topic for which I have considerable emotional feeling as well as intellectual interest, but I will try to discuss it here in the light of my experiences and observations as an educator and physician without regard to other factors.

A department of general practice in a medical school needs definition as to purpose, function, peculiarities or differences from other already established departments, educational need, and qualifications of staff. Each of these must be carefully delineated in the light of the purpose of the medical school—*that of supplying well-trained physicians to meet the total medical needs of the country. There is no other proper reason for the existence of a medical school.*

True it must train men for research, for teaching, for opening new frontiers in the advancing science of medicine as well as for the active practice of medicine; but all of these find their respective purpose culminated in funnelling back their knowledge, experiences and findings to the clinician at the bedside, to the patient who is in need of the most complete care modern medicine has to offer.

Justification

With this as the purpose of the medical school, a department of general practice must justify its addition to the medical administration of the school by fulfilling the purpose of the school through adding to the curriculum a body of knowledge and instruction peculiar unto itself, such as cannot be properly and effectively added by already established specialty departments. This is a big order but it must be recognized that if it cannot be filled, there is little reason to disrupt the already over-crowded departmentalized school. If it can be filled, it becomes the responsibility of the medical school authorities to take steps to correct this omission in the undergraduate curriculum, if they are to fulfill the purpose of their school. The functions of a department of general practice should complement and supplement the already existing teaching functions of the specialty departments, just as in actual practice the reverse is true where the specialist complements, supplements and extends the general medical functions of the general practitioner.

General practice has been defined and redefined many times but for the purpose of this discussion I submit the following definition as more completely meeting our needs here:

> **General practice is that area of medical care performed by a doctor of medicine in conducting preventive, diagnostic and therapeutic measures in all fields of medicine, assuming a total continuing responsibility for the health of the individual or the family as a unit.**

This is a broad definition and differs from many definitions by not stipulating "limitations com-

Read before Section on General Practice, Washington State Medical Association, Seattle, Washington, September 17, 1957.

mensurate with training and ability." All physicians, regardless of their specialty, have limitations, even within their specialty, and such is not appropriate in a definition although it might be justifiable in a directive dealing more with ethics, morals and conduct than ability.

Essentials of a Department of General Practice

Because there seems to be some confusion and variance of thought on the definition of a department in a medical school, the following criteria are used here as being necessary for departmental status. A department has:

1. Its own fiscal allotment of university funds for operation.
2. Its own curricular student time allotment.
3. Its own physical space for operation.
4. Its own staff.
5. An appointed faculty department head.
6. Full responsibility for the content and presentation of the material taught.
7. Part or all of its courses required for graduation if it is an active teaching department.

For a department of general practice to be truly effective it must fulfill these seven criteria, otherwise it will be sufficiently unstable to ultimately lose its identity and standing. Its department head and members of its staff must be general practitioners.

Purposes of a Department of General Practice

Purposes of a department of general practice depend primarily on the assumption that the general practice or family doctor type practice is desirable and needed. The need has been recognized by medical educators, leaders in national medical organizations, other medical authorities, economists and those dealing intimately with national and community problems and needs. Opinion polls and spontaneous responses of the general public to lay articles on medicine indicate strongly that there is a desire, even a demand, by the public for well-trained available family doctors.

Purposes of a department of general practice may be noted, at least in part, as follows:

1. To complete the intramural representation of all fields of medical practice as a part of undergraduate training.
2. To give students an opportunity to associate with and be taught by physicians who have distinguished themselves in active general practice and thus learn what facilities and knowledge are necessary for doing good general medical practice.
3. To improve the level of medical practice in the community by:
   a. More direct training of the student choosing this field.
   b. Stimulation and promotion of graduate and postgraduate courses through the medical school for the practicing physician.
   c. Setting higher standards for future family physicians through more intimate medical school association and direction.
4. To coordinate and correlate the various specialty trainings of students for better total patient care.

(It can hardly be considered good teaching, with regard to assuming patient care, to have the student repeatedly referring his patients to other clinics because the complaints on that day do not happen to fall within the treatment scope of the student's assigned clinic, even though the student is competent to meet the patient's need. It is easy to translate this into student parlance of "passing the buck" or "sloughing the patient to another clinic," particularly if the day be hot or the patient load heavy and tiring. If we are to give the student confidence and responsibility enough to retain what he learns, it hardly seems pedagogically justifiable to meet his patient's multiple complaints by having him follow the patient through to several specialty consultations. That cumbersome process might be helpful in specialty teaching but at some point the school should insist that the student know enough to assume more than referral responsibility in the care of his patient. In the general practice clinic the student should have one staff man who should insist that the student draw upon his specialty training as completely as he can, seeking consultation only when his knowledge is exhausted. He can treat the diabetic hypertensive with leg ulcers and pelvic inflammatory disease without referring her to the diabetic clinic on Tuesday, hypertensive cardiovascular clinic this afternoon, GYN clinic Wednesday morning and surgery clinic for varicose ulcers Saturday morning. He studies his own abilities and knowledge to the fullest in response to the multiple needs of the patient before expanding his knowledge by consultations. This type of general-practice-responsibility-demanding student-teaching-clinic should be added to the specialty clinic teaching program of the school and not substitute for it.)

5. To teach the relationship of various specialties with the general practice of medicine at the undergraduate, postgraduate and active practice levels.

Functions of a Department of General Practice

Some of the functions of a department of general practice have been alluded to but others deserve more comment.

1. One of the functions is to bring together, as a functioning body of knowledge, all the specialty training of the student so that he may assume the proper responsibilities toward the needs of his patient. We discussed this more fully under purposes, which is hard to separate from functions.

2. To expose the student, during formative undergraduate years, to the home environment

of disease, sickness, recovery and rehabilitation and to direct him in meeting a physician's responsibility with his medical knowledge.

3. To give him an opportunity to see common diseases not seen in the hospital and to discover and see early disease in the home before it becomes of hospital or even clinic office severity.

4. To direct him in the clinical application of preventive medical measures so often taught by lecture and by occasional bedside comment, but lost to true learning for want of tangible application.

5. To demonstrate the proper breadth, as well as limitation, of general practice and the responsibility of the physician to be fully prepared to meet medical obligations as delineated.

6. To give instruction in family medical practice in home, office and hospital situations.

7. To give instruction in the availability of ancillary community medical and welfare aids.

Differences From Other Departments

Some of the peculiarities or differences from other already established departments in the medical school which give the department of general practice instructional value in excess of that of other departments might be listed as follows:

1. All phases or specialties of the practice of medicine are coordinated and brought into use for the expressed purpose of meeting the needs of the patient, no matter how multiple or few they may be. *It brings the student back to a broad base of thinking when approaching the patient.*

2. All members of a family, regardless of age or sex, enter into treatment consideration in restricted or broadest sense, for the sake of the health of the individual, the family, the community, or all three. *This gives the student a broad comprehensive concept of the entire field of medicine and orients him to the responsibility of being a doctor first, before being a therapeutic specialist.*

3. Emphasizes office and home management of illness, as contrasted to the usual specialist hospital management.

4. Scope of teaching has breadth rather than depth. The specialty of general practice has lateral rather than vertical scope. Eighty to 85 per cent of the training of the student is reemphasized in a *summarizing course resembling a practical examination designed specifically for teaching. The general practice clinic and home care course become a proving ground both to the student and the faculty as to what further training the student might find desirable as he seeks his future place in American medicine.*

5. A course in Family Medicine emphasizes the importance of recognizing the total family constellation in the practice management of any one individual. Preventive as well as therapeutic medicine finds a natural and realistic accent in the student's training.

Educational Need For a Department of General Practice

Recognition or denial of the educational need for a department of general practice within a medical school curriculum rests with the acceptance or rejection of the foregoing objectives in student teaching. Medical education cannot ignore the need to add this type of teaching to the curriculum, even at the expense of diluting some of the already existing courses. Many schools have already changed their entire curriculum in an attempt to meet some of the objectives mentioned. An active and expanded department of general practice must offer these educational advantages if it is to justify itself. A well-organized, fully supported curriculum of a department of general practice can offer many of these educational advantages. •

62 S. Dunlap Street.

Prepublication copies of the above paper were sent to 78 deans of medical schools and four other educators in important positions. Twenty-seven deans replied. Sixteen of the letters were simple acknowledgement, usually with an expression of interest, but did not include permission to publish. Eleven of the fourteen letters published below are from deans and one is from a department head. These replies, therefore, reflect the situation in 15 per cent of the nation's 78 medical schools. Some schools known to be contemplating or having established departments of general practice are not represented in the replies. Ed.

EDITOR, NORTHWEST MEDICINE:

I think the best way to respond to your inquiry of February 4 is to ignore the confusions and tensions of the present and to look ahead and anticipate the way things will or ought to be in the near future.

In doing this I will be extending the remarks I made in a letter I wrote on May 7, 1957, to Herman G. Weiskotten, presently Chairman of the AMA Committee on Preparation for General Practice.

I have come to believe that whatever we do, we must accept the fact that the knowledge important to medicine is going to increase at an ever-accelerating pace and that specialism, which has arisen in response to this expanding body of knowledge, is going to increase at the same time. I think we must also accept as fact, that as medical knowledge continues to increase, we can no longer produce physicians who can effectively carry on according to our present concepts of general practice. And yet, as medical knowledge grows and as specialism grows, I believe that the need for a special kind of generalist who will need a special kind of training will definitely emerge. In fact I think this need is apparent now.

What I am really trying to say is that instead of attempting to resolve the problems of general medical care in terms of the status quo, we should look ahead in the light of present trends and try to anticipate what the capacities and patterns of medical service will be or ought to be, say 20 years from now. It is the men and women we are educating now who will be carrying the burden by then—not us. The kind of general practice residencies that are being offered today are geared to the status quo and in terms of present-day trends are not realistic.

What do I mean when I say we will need a special kind of generalist? I think this physician had best be described in terms of what he will do, rather than in terms of what he will not do.

He must be qualified to serve as the health counsellor throughout the entire life span of any given individual. He will be dedicated to the philosophy of continuing care. He must be trained to supervise the care of infants, adolescents, mature adults and old people. The management of chronic illness will be his forte; rehabilitation will be his passion. He must be an astute diagnostician, particularly if he is to recognize and intelligently control significant disease in its beginnings. His function will be to maintain and promote health as well as to prevent or combat disease. There is a very impressive body of knowledge that is now accumulating in the area of health management and disease prevention. An intimate part of this comes from the field of mental health and psychosomatic medicine. Therefore, this physician must be well trained in mental hygiene and clinical psychiatry.

This physician's training in the medical and surgical specialties will only go far enough to give him an understanding of their diagnostic and therapeutic concepts. He will not be trained in the technical aspects of any of the surgical specialties. I would not want him to have training in obstetrics. With modern communications and transportation developing as they are and with our population becoming more concentrated and homogeneous, the need for any physician to practice in isolation without quick and easy access to fellow specialists is almost over or certainly will be 20 years from now. Thus, this physician's training will be such that he will know when his patient needs the services of a specialist from a field other than his own—he will follow the patient through the period of his care so that he can continue on when the specialist is no longer needed.

One of the fundamental responsibilities of this physician will be to guide his patients through a complex structure of medical care. In all probability the bulk of his activity will involve the ambulatory patient. The main center of his activities will be his office. But from this office, according to the best interests of his patient, he will extend his services into the hospital or into the home and the community. He will be keenly aware of the importance of utilizing those community resources having something to offer in the management of his patients. Because of his firsthand knowledge of the home and the community, he will be in a position to manipulate or help his patients adjust to environmental factors that may be of importance in their health problems.

The training of this physician will draw from the fields of preventive medicine, psychiatry, pediatrics and internal medicine. I believe the training could not be obtained in less than three years and, if this were the plan, I believe the specialty areas concerned could be induced to pool their resources and develop a well-rounded training program. I also believe that specialty board status should be provided, and I suggest the name of "The American Board in General Practice."

As I read the future, medicine's greatest challenges lie in the field of mental hygiene and preventive medicine. And I believe that if these challenges are to be met, it will only be through the medium of the kind of physician I am advocating. If the knowledge of either of these areas is to be applied effectively, it must be grafted upon a basic knowledge of pediatrics and internal medicine, and its application will depend completely upon the rapport of the patient-physician relationship. I am not advocating the training of a specialist in public health. Nor am I advocating that the specialist in general medicine supplant either the pediatrician or the internist—he will need both upon occasion as consulting specialists.

In essence then, I am proposing a new specialty: one that can be defined in positive terms; one that will depend upon the development, organization and application of a special body of knowledge; one that will require special training, and one that will fill a need that no other specialty will fill.

Now turning briefly to Dr. Davison's paper, I do not see the establishment of medical school departments of general practice as the answer to this problem.

In fact, as I have carried the problem of the need for a general physician upon my mind from year to year, I have become convinced that surgery should be dropped from all general practice residencies, that the residency period should be lengthened and that all of the effort should be centered around the concepts I have outlined above. Until such time as large numbers of these specially trained physicians can supply the needs for teachers and investigators as well as for practitioners, the training program must be the joint responsibility of the pediatricians, internists and psychiatrists. And if our psychiatrists are to meet this responsibility, it will mean that they will have to develop and apply teaching programs that very few up to now have taken on. I believe that the psychiatric knowledge essential to such programs exists, and I would like to think that the challenge inherent in the above concepts will attract psychiatry to the task. We need to have a better understanding as to how the physician-patient

relationship can be developed and used as a more deliberate force in medical and health evaluation and management.

It seems to me that in order to justify general practice as a special area of teaching with separate departmental status it should, like all other special areas, be centered around the development of a special body of knowledge through research. General practice, as we know it, is not in a position to do this. On the other hand, as a special academic area, general medicine of tomorrow could develop the research essential to the concept I am promoting. For example, research centering around health evaluation and management should extend into the field of the doctor-patient relationship and how to make it a really effective diagnostic and therapeutic instrument. A special study of doctor-caused and aggravated illness (iatrogenic illness) would be in order. And further, research could be extended into the measurement of the effectiveness of medical care—effectiveness as to the various patterns of medical care and of experiments therein.

All specialties have arisen in response to special knowledge and special needs. I believe that such is now the case in the field of general care. I believe that Dr. Davison and I probably agree on the need that exists, but with his definition of general practice centering around things as they are and my concept centering around things as I think they ought to be, I do not see much chance of our getting together on the idea that all medical schools should have departments of general practice.

Except for the existing family care or general care clinics, much will have to happen before my concept could develop to the point where it could be expected to have any impact upon the departmental organization of a medical school. I would point out that these clinics are not general practice clinics. For the most part they are administrative devices whereby a staff, mostly made up of internists, pediatricians, psychiatrists and general practitioners who do no surgery, are pooling their capacities and interests in emphasizing to medical students, interns and residents the importance of the total patient and his continuing care. Many of these are concerned with research in patient care and in medical education. In other words, I think these clinics may represent the beginning of the things I am interested in, but I believe we have a long way to go before we begin to bite off a very significant portion of our total problem.

I believe that Dr. Weiskotten's committee represents a logical and intelligent approach to the future of a medical generalist. I hope that neither the committee's recommendations nor its acceptance will compromise the best interests of the best posssible education. We must have an educational program that will compare in excellence and stature with those in any of the existing specialty areas. If we advocate anything less than this, it is my humble opinion that graduates in medicine will seek to enter training in more attractive and challenging fields.

Most sincerely yours,
Ward Darley, M.D.
Executive Director

Editor, Northwest Medicine:

I want to thank you for your courtesy in sending me the proof of the article by Dr. Robert A. Davison on "The Medical School Department of General Practice." I must say that your comment in your covering note to the effect that the views of thoughtful educators may or may not coincide, is undoubtedly correct.

Here are my thoughts on the matter: It seems to me that Dr. Davison (whom I have met and talked with) is confusing two things—A Department of General Practice in a medical school and a Department of General Practice in a hospital or hospital clinic. The two things are by no means synonomous. From our point of view at least, a medical school department is an academic unit whose purpose is primarily to teach fundamentals and basic principles of medicine, and the medical school organization is departmentalized primarily for the purpose of convenience in such teaching. In a hospital on the other hand, a department is designed primarily as a service function for patient care although, of course, intimately bound up with teaching at the same time. In other words, in a hospital such a department is designed for the practice of medicine, not primarily for instruction in fundamental principles.

Another way of stating what I have just said might be this: Any course in general practice actually represents the application of methodology or techniques—that is, the application of the basic principles learned in the regular departmental program, to special situations. For example, a student learns the proper methods of treatment of a patient with pneumonia, primarily under the direction of a department of medicine. Those general principles apply no matter where the patient may be treated. On the other hand, in a course in general practice, the emphasis would likely be on how to treat a patient with pneumonia in a home in the country, for example, or in a tenement house in the city. Granted that the handling of patients under these conditions may not be identical with that in a good hospital, nevertheless the differences represent the application of techniques—not any difference in fundamental principles.

That is the reason why I oppose the establishment of departments of general practice in medical schools, and our faculty is in accord with my position. I would have no objection to creating a special division or section under some special name for this purpose but I would object vigorously to setting up a unit which would theoretically be on a par with other regular academic units.

Another point I would like to bring out is that many of the items mentioned by Dr. Davison can well be covered in other departments and, indeed, in our own school are already so covered. For instance, under the heading "Functions of the Department of General Practice" he lists "to give instruction in the availability of ancillary community medical and welfare aids." In our own school that has been done for several years as a part of the

student's regular course in preventive medicine. One does not need a separate department in order to teach that kind of material. Furthermore, in many schools there are programs listed under various labels, one of which is "Family Care Program" whereby students do have contact with families in their own homes and environments. That is true in our own school although at the present time it is on an elective basis; in some schools it is compulsory, I understand. Here again this can he carried on as a function of a regular department as, in our case, the department of preventive medicine.

Finally, the general practice clinic in a teaching hospital, as described by Dr. Davison, is already in effect in some institutions, although not necessarily called by that name. I have visited medical schools and their teaching hospitals where such a clinic almost exactly as described hy Dr. Davison is in operation, serving precisely the functions he describes, but not officially labelled as either a general practice clinic or a department of general practice.

I might sum up by stating that my objections to a separate department of general practice in a medical school are based on a difference in philosophy as to what departments in general mean in the academic sense. A department of general practice in a hospital is not objectionable and as you know, the Joint Commission on Accreditation of Hospitals recommends that such departments be established. And to summarize the second major point which I raised above, I repeat that much of the material which is included under the heading of a department of general practice can easily be taught, and in many instances is taught in many schools, as a part of the program of other departments.

I will be interested in other deans' reactions to this.

Sincerely,
J. Murray Kinsman, M.D.
Dean

P.S. I should have mentioned somewhere along the line that in our school for may years we have had a series of lectures given to our seniors by general practitioners, on the subject of general practice. I think these have very definite value because they do cover certain aspects which are not included in the regular curriculum *but* here again the important point is that the emphasis is on methodology and techniques, not on fundamental principles.

EDITOR, NORTHWEST MEDICINE:

I read Dr. Davison's paper with interest. It is a little hard to comment without getting involved in the intricacies of the Medical School curriculum and departmental organization. The use of Department and Division varies so much in different schools that more precise definitions than Dr. Davison supplies would be helpful. However, I have made the following comments which you may use if you see fit.

If I understand Dr. Davison correctly, it is hard to disagree with his thesis that during his undergraduate years the medical student should have some opportunity to study and treat patients as human beings in a particular environment, including their ecology and emotional as well as physical ills. Various plans to accomplish this are in effect in a number of medical schools. At Tufts University School of Medicine, for instance, fourth year students are assigned full time for two months to Preventive Medicine. During this period they make home visits under supervision, see the same patients when indicated in their "Office" in the outpatient clinic, and follow these patients to the Rehabilitation Institute or to such consultations as are indicated. The experience is made as much like the private practice of medicine as possible and practical. This is implemented by the cooperation of the Departments of Medicine, Surgery, Pediatrics and Psychiatry, as well as the Specialties, under the coordination of the Department of Preventive Medicine.

I cannot agree with Dr. Davison that his objective can only be accomplished by a Department of General Practice. He justifies such a department in the belief that it would add to the curriculum "a body of knowledge and instruction peculiar unto itself." What this body of knowledge is, I do not know. We hear much of "training students for general practice." This implies that at the *undergraduate level* the training of a man who plans to enter general practice should differ from that of a man who plans to specialize, teach, or follow a career in research, public health, or industrial medicine. Certainly in the lay mind at least, "training for general practice" infers inferior training. Since the family doctor or general practitioner usually sees the patient first, when diagnosis is most difficult, and when action must be based largely on the physician's judgment rather than on the results of a battery of laboratory tests, it seems to me that his background in physiology, pathology and pharmacology, as well as in the clinical disciplines, must be just as broad and just as thorough as that of his colleague who will enter a narrower field.

Sincerely yours,
J. M. Hayman, Jr., M.D.
Dean

EDITOR, NORTHWEST MEDICINE:

Thank you for the opportunity of reviewing the manuscript by Dr. Robert Davison, "The Medical School Department of General Practice."

Perhaps more than most "Medical School Specialists," I am in agreement with the conclusion that the graduate of our medical school should be a generalist (that is—family doctor, general practitioner, general internist).

Under today's schooling we are only achieving this aim by an internal medicine residency. Various attempts to construct general practice residencies are certainly useful, but the "GP Specialty Board" movement needs to ask itself if the solution is in extending the training program, or if the true problem is not on the present

poor use of the seven years of pre-degree time now available. Dr. Davison is suggesting a solution by adding another full department to the school. Such an approach has possibilities. However, many of the purposes and values cited by Dr. Davison are already obtained in certain medical schools by strong general medicine clinics (attended by both internists and American Academy of General Practice members) and required general practice preceptorships.

By supporting these efforts with a continuing education program (circuit courses, symposia, seminars), a regional medical school can produce a brand of family physician of amazingly high caliber. We have watched this happen in Kansas.

I believe that a new department will gradually emerge in our medical schools. It will grow from our present internal medicine departments. Into this department should be brought general practitioners with titles, duties and responsibilities. The objective of this group should be to guide an education program which will produce a family physician. The *graduating product should be the family doctor*. If a residency is required to accomplish this, then the seven years are not presently satisfactorily used. The solution is not in additional departments or residencies, but in a drastic reorganization of the presently available seven years.

Cordially yours,
Edmunds Grey Dimond, M.D.
Professor and Chairman
Department of Medicine

Editor, Northwest Medicine:

Thank you for the opportunity to read the article, "The Medical School Department of General Practice," by Dr. Robert A. Davison and to express my views about its general theme.

There is no disagreement between Dr. Davison's objectives and mine in medical education, though we disagree in the methods of arriving at their implementation. I believe that Dr. Davison, himself, presents a bit of inconsistency in that under "Differenees From Other Departments," Item 4, he states "The general practice elinic and home care course becomes a proving ground both to the student and the faculty as to what further training the student might find desirable as he seeks his future place in Ameriean Medicine" and under "Educational Need for a Department of General Practice," he states "Recognition or denial of the educational need for a department of general practice within a medical school curriculum rests with the acceptance or rejection of the foregoing objectives in student teaching."

In my opinion, it is desirable to have a general practice clinic and home care course, but in order to have such a course it is not necessary to create a new department. I believe that the prestige of a department of medicine in a medical school would afford the kind of leadership and cooperation which the offering of such a course requires. Because of the emphasis of late on specialization, I doubt that a group of men specializing in general practice would have the prestige and command the support in the average medical school which the offering of such a course requires.

It is my conviction that in order to present the objectives and the philosophy of the general practitioner, it is desirable to have in every basic science department at least one general practitioner serving on a part-time basis. We have this arrangement in Anatomy, Pathology and Pharmacology. I hope to be able to extend this interest to the other departments concerned.

Sincerely yours,
Robert S. Jason, M.D.
Dean

Editor, Northwest Medicine:

I am pleased to comment on the thoughtful article by Dr. Davison.

The plan to establish a department of general medicine is not new, nor has the idea been given superficial consideration. Particularly since the rise of the interest in specialty boards, there also has been noted a gradually increasing interest in various ways and means through which a more adequate experience can be provided for those interested in general practice.

No one has defined exactly of what general practice consists, nor how a curriculum should be devised. Unfortunately in the minds of many it is associated with inferior ability, which it certainly should not be. The faculties of various medical schools both in the United States and in Canada have considered on many occasions the possibility of establishing departments of general practice. Such departments have been established abroad about the time plans for "national" medicine were developed. Edinburgh in 1948 established a department which is apparently still going. The intent was to demonstrate to students the "indivisibility of medicine and to illustrate the social aspects of health and sickness."

The general attitude of the faculties of the medical schools in this country is to provide a strong basic background of medical experience which would permit students to go in practically any direction after the completion of formalized supervised training in their undergraduate years.

The idea of separate departments for general practice has been generally rejected for several reasons but primarily because of the possibility that they may become units of vocational training rather than a true educational experience. Graduates would likely be a discredit to the cause of the general practitioner. The accumulation of medical knowledge available today as a result of emphasized basic and clinical research in the medical fields makes it almost impossible for the medical school faculty to transmit to the student the full array of information he might need in any area.

There is a consensus that teaching experience can and should be condensed rather than extended—or at least started earlier—so that training for special areas, including general practice, may be obtained after graduation from medical school. No one should deny the importance

of the role of the general practitioner. However, to believe that the pressures toward excessive specialization come from the undergraduate years is wrong. They come mostly from the student's knowledge of the way medicine is practiced after he receives his degree. I do not believe departments of general practice will change this attitude, but I am pleased at the apparent current trend toward a greater interest in general practice.

L. T. Coggeshall, M.D.
Dean

EDITOR, NORTHWEST MEDICINE:

Your kind letter inviting me to comment on Dr. Robert A. Davison's interesting article entitled "The Medical School Department of General Practice" was appreciated.

I certainly agree with Dr. Davison that the primary purpose of a medical school is "that of supplying well trained physicians to meet the total medical needs of the country." However, I should prefer to believe that these total needs are met best through the coordinated contributions of the entire faculty of the school of medicine. Each member should add to the student's knowledge of comprehensive care. Certainly coming in contact with and learning from qualified teachers of general practice medicine will help many students organize their thoughts about practice. However, all of the procedures outlined in Dr. Davison's manuscript can be carried out in a well organized Department of Medicine.

Although I can not agree with Dr. Davison's recommendation for a Department of General Practice in the School of Medicine, he has brought forward some timely thoughts to all of us who have responsibilities in medical education.

Most sincerely yours,
John Parks, M.D.
Dean

EDITOR, NORTHWEST MEDICINE:

In response to your letter of January 28, 1958, I submit the following:

Dr. Davison's article certainly explores a field greatly in need of much development. I believe that in the process of recognizing the various foibles of professional jurisdictional jockeying for administrative position, we sometimes miss the point. Before synthesis of knowledge can be effected, some compartmentalization of the approach to the acquisition of the knowledge to be coordinated must occur. The functional approach of the students' handling of patients and the supervision provided should approach the whole patient and not a distributed or segmented psyche and anatomy. I have proposed, pending adequate funds, that we approach the teaching of total patient care through the medium of our out-patient department as the central core. The student under the supervision of adequate internists and general physicians will maintain an "office." The families and household neighbors become his patients as his case load develops. He makes the necessary house calls; he arranges for hospitalization and follows the patient throughout his hospitalization and carries out post-hospital care. The consultant comes to the general medical clinic. A regular consultation form is executed and incorporated in the record. Patients having conditions which should be cared for by specialists are referred for definitive care and returned. The student is obliged to keep in contact with the specialist consultant and the patient when the patient is to be returned after definitive examination or therapy. It is hoped that a practical training program in the area of general medicine can thus be approached. Too much talk on department or departmental status is too divisive.

Trusting that the above comment will be helpful, I am

Sincerely yours,
F. G. Gillick, M.D.

EDITOR, NORTHWEST MEDICINE:

This is in answer to your request for comment on the article "The Medical School Department of General Practice." I believe my general feelings were expressed in the report "Medical Schools in the United States at Mid-Century," published by McGraw-Hill. On page 323 there is a brief description of general practice, and in the chapter on medical school departments, page 180, there are recommendations with respect to the formation of new departments.

I do feel that the teaching in medical schools becomes chaotic when a large number of departments are involved. Certainly, the trend today is to more closely integrate and draw together the teaching of existing departments. Departments of internal medicine as now organized could very well, can and often do, offer the student a sound background for the practice of a limited type of general practice.

John E. Deitrick, M.D.
Dean

EDITOR, NORTHWEST MEDICINE:

The need for more and better family physicians can scarcely be disputed. Good basic medicine is the same, however, whether it is practiced by general practitioners or by specialists. At Johns Hopkins, and I assume in most other medical schools, an effort is made to teach the basic principles of diagnosis, treatment and prevention of disease rather than to try to acquaint the student with every situation which he is likely to encounter in practice.

I would see little to be gained by setting up a department of general practice which would inevitably duplicate most of the things departments of medicine and

pediatrics are now doing or certainly should be doing. A better approach, in my opinion, would be to develop further the group clinic idea in out-patient services which more nearly reflects the office type of practice that comprises the bulk of family practice today.

I might say that at Johns Hopkins we have some very fine general practitioners teaching in our out-patient clinics, although I doubt if even these general practitioners would in fact attempt to conduct "preventive, diagnostic and therapeutic measures in all fields of medicine—."

Sincerely yours,
Thomas B. Turner, M.D.

Los Angeles 33, California

EDITOR, NORTHWEST MEDICINE:

I have serious reservations regarding Dr. Davison's proposal. The principal one centers about his statement that "the scope of the teaching is breadth rather than depth." I have a haunting suspicion that in our medical schools we attempt at present to cover far too much of the field and often in a quite superficial manner. I would question the wisdom of training medical students in techniques of practice and instead would favor emphasis on basic principles of underlying mechanisms, diagnosis and therapy as well as the cultivation of an inquiring attitude. I believe that these objectives can be accomplished without sacrificing the valuable features provided for in Dr. Davison's program, such as experience with disease in early stages and the viewing of the patient as a whole in his social environment.

I should think the answer lies in operating our programs in a better fashion rather than instituting a new department which offers breadth rather than depth.

Sincerely,
Thomas H. Brem, M.D.
Dean (Acting)

EDITOR, NORTHWEST MEDICINE:

I have enjoyed the opportunity to read the article by Dr. Davison and I am interested in his comments on the need for Departments of General Practice. I am sure that all medical educators recognize the need for the education of students in a manner that will permit them to deal with the diverse disease and health problems encountered by the general practitioner. The main question is—can this be accomplished within existing departments or is it necessary to establish a separate department for such a program? I believe that all of this can be accomplished within existing departments.

A number of Departments of Medicine, Pediatrics, or Preventive Medicine operate Home Care Programs such as Dr. Davison describes.

At Wisconsin, we have conducted a Preceptorship Program since 1925, and we feel that this has been a most valuable approach toward having students understand the complex problems inherent in the practice of medicine.

I am not aware that the program at Tennessee has led to the production of a larger number of general practitioners than is true in other tax-supported medical schools.

Yours sincerely,
John Z. Bowers, M.D.

Chicago 10, Illinois

EDITOR, NORTHWEST MEDICINE:

Thank you for sending me the proof of the paper by Dr. Robert A. Davison on "The Medical School Department of General Practice."

At the present moment I do not believe I have any comments to make in regard to this article. As you know, the Council on Medical Education and Hospitals of the American Medical Association in cooperation with the Association of American Medical Colleges and the American Acadmey of General Practice has a very active committee studying the best background preparation for general practice. It is hoped that during the course of this year, the Committee will be able to make a report and recommendation geared in as effectively as possible with the knowledge and needs of the times.

In the meantime, I think many individuals who have given a great deal of time and thought to this matter would be inclined to state that a medical school department of general practice is only one out of several possible ways of emphasizing the background experiences essential to the field of family practice.

With best regards,

Very sincerely yours,
Edward L. Turner, M.D.

EDITOR, NORTHWEST MEDICINE:

I have read the galley of Dr. Davison's article on "The Medical School Department of General Practice" with a great deal of interest, and I appreciate your invitation to discuss the paper for your journal. I think that Dr. Davison's paper is very good, and he raises a number of points which are subject to careful consideration and discussion, for there is something to be said on the other side.

Unfortunately, I must leave within a very few days for a series of meetings out of town which will occupy my attention fully, and I simply do not have time to write the necessary comments before I leave.

With regrets, I am,

Sincerely yours,
John McK. Mitchell, M.D.
Dean

Acute Fatty Metamorphosis of the Liver Associ

Clinical Pathologic Conference
Providence Hospital, Seattle, Washington

Prepared under the direction of David G. Mason, M.D.

Protocol

M. Richardson: This patient is an 18 year old white woman who entered Providence Hospital July 29, 1956 at 7:15 P.M. for induction of labor, with a complaint of nausea and vomiting. She was gravida 0, para I with an expected date of confinement of July 30, 1956.

Present Illness: Patient was seen in her physician's office two or three days prior to admission. Blood pressure and urinalysis were normal. She complained then of some nausea and vomiting for which she was given 25 mg. of chlorpromazine.

Past History: Menarche occurred at 11 years. Menses were moderate and lasted three to four days at 28 day intervals. Health prior to pregnancy was good. During the first trimester, moderate nausea and vomiting occurred.

Physical Examination: T 98.6 F.; P 110; R 22; BP 114/80. Scleral icterus was questionable. The throat was slightly injected. Lungs were clear to percussion and auscultation. The breasts were firm. The heart beat was rapid and bounding. A soft, grade II, systolic murmur was audible over the aortic area. Tumor of pregnancy was present with the fetal head well down in the pelvis. Fetal heart tones in the LLQ were 136 per minute.

Laboratory: Urine was yellow, cloudy; S.G. 1.011; albumin 40 mg.; *p*H 4.5; reduction and acetone negative; RBC 3-5; WBC 5-7; epithelial cells moderate; considerable numbers of bacteria and much mucus. Blood count was not done.

Hospital Course: On the evening of admission the patient was given 200 mg. secobarbital and one ampule of Synkayvite, intramuscularly. During the night she went into spontaneous labor. At 5:45 A.M. on July 30, 1956, a vaginal examination was done and the membranes were ruptured with moderate fluid loss. The fetal heart tones were 136 to 140. At 6:30 A.M., 200 mg. secobarbital, 100 mg. meperidine, and 1 minum of oxytocin were given. At 8:30 A.M. a prolapsed, non-pulsating cord was evident on second sterile examination. At this time it was determined that the heart tones of the fetus at 136 per minute were synchronous with the mother's. A diagnosis of fetal death was made. At 8:30 A.M., in the morning light of the labor room, the sclerae were unequivocally icteric and the skin was also slightly icteric. Labor progressed and at 9:50 A.M. a 7 lb. 2 oz. boy was stillborn under nitrous oxide and oxygen anesthesia. A left medio-lateral episiotomy was done and outlet forceps used. Following delivery of the placenta, 1 ml. of Methergine was given. Repair of the episiotomy and of a left lateral cervical laceration with a deep sulcus tear of the left vaginal wall was done. Blood loss was estimated at 1 L. Intravenous fluids and dextran were started. The blood pressure at this time was unobtainable. Pulse was weak, rate 100 per minute. The fundus became boggy in spite of intravenous pituitrin and massage. By now, it was becoming apparent that the degree of sedation seemed in excess of that expected with the given medications. Following delivery, two massive episodes of vaginal bleeding necessitated the giving of 2 units of blood simultaneously under pressure. A blood sample revealed sluggish clotting without retraction. Five Gm. of fibrinogen

ated with Pregnancy

was given along with vitamin K. On one occasion blood pressure of 80/40 was obtained. Through the day she was given 13 units of whole blood and other intravenous fluids. Bleeding, shock and unconsciousness persisted. At 4:00 P.M. laparotomy revealed a boggy uterus and an hematoma in the left broad ligament. Through a supracervical hysterectomy and left salpingo-oophorectomy the pulse stayed at 100 to 112 per minute. Bleeding per vagina persisted. Further manipulation was not possible and a vaginal pack was inserted. At 6:30 P.M. the respirations were 30, pulse 120, and blood pressure unobtainable. At 8:35 P.M. the respirations and pulse ceased. It was later learned that during the past two weeks the patient had not felt well, noting malaise, chills, slight temperature elevations and dark brown urine on several occasions.

Differential Diagnosis

Jerome Smersh: First of all, I would like to bring out a few points which will be worthy of comment: (1) complaint of nausea and vomiting, (2) color of the urine, (3) excessive sedation from moderate dosage, (4) icterus, (5) the wounds—episiotomy, cervical and vaginal lacerations, (6) fibrinogen administration, and (7) the final sentence of the protocol.

This final sentence is most basic, and shows me not only the direction in which to head, but makes me suspect that this is one of the more important reasons for this case being presented. I think what we are trying to show here is the importance of always getting a good history from our patients, including the obstetric patients. Pregnancy is such a normal situation in the vast majority of cases that we tend to see obstetric patients quickly, and often fail to ask them specific questions on every visit. I think this case is a good lesson in this respect.

In view of this last sentence, in particular the mention of dark brown urine, along with nausea and vomiting, icterus, and the matter of excessive sedation, the underlying basic disease would appear to be in the liver. The dark urine signifies the presence of bilirubin. It further signifies regurgitation jaundice primarily, with no doubt retention jaundice as well. I am sure of the former. I feel that this is caused in this particular case by some type of diffuse pressure in the biliary system due to swelling of hepatic cells. As to etiology of this damage to liver parenchyma, the most likely cause would be viral hepatitis.

There are other things to consider as far as differential diagnosis is concerned. Although the vast majority of cases presented in pathologic conferences deal with unusual diagnoses, I am going to go on the premise that the main point in presenting this case is to show the importance of history details. I do not think this case falls into the toxemia of pregnancy classification in any way. There is some albumin in the urine, which may or may not be significant. It is more likely the latter, even if the specimen is a catheterized one. I do not think we have to go to the extreme of acute atrophy of the liver to explain the cause of death. Less severe underlying liver damage with resultant interference with blood

coagulation could explain the sequence of events. There could well have been acute atrophy in this case as a terminal situation. It appears that acute atrophy of the liver is simply a more severe form of acute hepatitis. It frequently will occur where a damaged liver is subjected to another type of insult even though it may be mild.

Hepatitis may be of two types: Infectious hepatitis or serum jaundice. They are basically the same as far as pathology and clinical symptomatology are concerned, fundamental differences lying in the incubation period and the actual source. Fever is uncommon in the preicteric stage in serum jaundice. There is diffuse involvement of the liver in both cases. There is usually jaundice, although jaundice may not appear. In some cases, jaundice is the only symptom or sign. The onset may be quite abrupt or it may be insidious. Anorexia, nausea, headache, abdominal distress, lassitude, frequently fever, and often chills or chilly sensations are the symptoms of hepatitis. Nausea and vomiting are frequent. Majority of the cases have abdominal symptoms preceding jaundice by one to three weeks. The urine is commonly dark, one or more days prior to the appearance of jaundice.

I would like to comment on the yellow urine at the time of hospital admission. This is not in contradiction to what I have already said. With the onset of hepatitis, the renal threshold for the one minute, so-called prompt bilirubin, is low. Bilirubin spills over into the urine very easily at the onset. Then jaundice increases the threshold, and the bilirubin in the serum can reach higher levels and yet not appear in the urine. Renal threshold for bilirubin probably explains why this urine was not dark when seen in the laboratory.

A brief comment only is necessary regarding the excessive sedation. This again points to the liver. Barbiturates are excreted by the liver, and if there is liver damage we would expect increased sedation from the dose administered here.

It is to be noted that there was secondary blood loss from the episiotomy and lacerations. However, we still have the uterus as a source of blood loss, so that these are not necessarily significant. What is significant is failure of blood coagulation.

This patient received fibrinogen. This is a case in which I would not expect fibrinogen to help very much, as I feel it is the prothrombin that has been affected rather than the fibrinogen. Liver damage must be very severe in order to have interference with fibrinogen. Also, fibrinogen must be almost totally absent before coagulation fails. Prothrombin is affected much sooner than fibrinogen, and I believe this to be the basic defect here. Vitamin K will act to help the liver produce prothrombin, but did not help here because the liver was damaged, and was not able to promote prothrombin formation.

As to the blood she received, one can only say that we do not know how fresh the blood was. We know that several factors in the blood—platelets, prothrombin, and fibrinogen—decrease on storage. This is particularly true of prothrombin which diminishes very rapidly on storage. I feel, therefore, that she probably did not receive very much actual prothrombin from the blood transfusions.

Finally, I would say that we are dealing with a case of liver damage. It is most likely a case of viral hepatitis with hemorrhage the immediate cause of death due to the damaged liver and consequent lack of prothrombin, with possibly excess barbiturate effect being a contributory factor.

Discussion

Dr. Mason: Are there any questions from anyone in the room to the discussant or to Dr. Codling whose case this happened to be?

Henry Myers: In this case I agree with Dr. Smersh. Any medication is probably too much. In this case, certainly, 200 mg. of secobarbital followed sometime later by another 200 mg. secobarbital and 100 mg. meperidine is too much medication. However, I must admit that in ordinary circumstances in a healthy patient I might give more.

There is one other thing here that has not been brought out—that is, this was a pretty traumatic delivery. With no remarks directed toward the obstetrician, there are some deliveries which are traumatic because you can not do anything about it. But with a lateral cervical tear and deep sulcus tear, I think that very probably we had one or more branches of the uterine artery involved in this thing also. This would not help the situation any.

A Physician: I do not think that the barbiturates were given in excess. Certainly, I think that we should consider the operative wound. This woman was evidently bleeding very badly. I would like to ask a question. How long did the baby live? Was it a macerated stillborn or was it a recent death?

Henry V. Bories: I would like to ask Dr. Smersh one thing. Inasmuch as you gave a diagnosis of infectious hepatitis, can you classify what type of liver lesion this is? Is it necrotic?

Dr. Smersh: No, but it could be. You could have a diffuse atrophy—acute atrophy terminally —but I think that you could just say diffuse parenchymal damage.

Dr. Mason: Can we get an answer to the question about the fetus? How about the fetus, Dr. Codling? Was it macerated?

John Codling: No, this was a very recent death. I do not know if this fact was brought out in Dr. Richardson's presentation, but perhaps a little clarification is necessary. When the cervix was 5 cm. dilated, a sterile vaginal examination was done—approximately at 6:30 A.M. The membranes were bulging and were ruptured with forceps. About one hour later a prolapsed cord was noted. No fetal heart tones were noted. Apparently the fetal heart was recorded on the chart at 136 per minute, an hour or so before. The mother's pulse was also 136. In retrospect, these could have been one and the same—meaning that the infant could have been dead prior to prolapse of the cord. It should be noted here that in 13 of the 14 cases of this disease that have been recorded in the world literature, every child has suffered intrauterine death.

David Metheny: This woman had her blood volume practically replaced. The blood that replaced hers had anticoagulants in it. There is some debate in the literature whether the anticoagulants in this amount of blood would affect the coagulation of the recipient or not. The army regulations at one time stated that people receiving massive transfusions should be given calcium. Later on they seemed to think that calcium was not necessary. However, in this particular patient, who must have had liver damage, the anticoagulants in the donor blood might have been a factor in failure of her blood to clot.

Dr. Mason: I think that they used to use about 50 cc. of 1 per cent sodium citrate. Isn't that right, Dr. Coleman?

Daniel Coleman: I think the answer to that is not so much that a calcium deficiency has developed as what was partially brought up earlier—that this patient was losing her own prothrombin and accessory factors by bleeding. If she is given whole bank blood which does not contain these factors, they actually compound or initiate an hemorrhagic tendency. A patient can start bleeding with a peptic ulcer and end up with an hemorrhagic diathesis due to the lack of these factors. Clinically, I do not think that calcium deficiency has ever been indicted as a reason for a bleeding defect.

Alexander R. Stevens, Jr.: I do not think it is used very often. However, in the last week, two patients at Harborview might have been given calcium. I do not think that point has been well settled.

A Physician: I believe that our turnover in blood here is so rapid that most of the blood is just a few days old and still relatively fresh when used. It would have adequate labile factors. It certainly contains adequate prothrombin and adequate fibrinogen. I find it difficult to subscribe to Dr. Coleman's hypothesis unless the blood was three weeks old, and it practically never is here in Seattle.

Lois Day: In reference to the bleeding and the amount of stored bank blood this patient received, I had an experience with a patient who had an abruptio placenta with massive hemorrhage before the advent of fibrinogen. She received approximately 13 units of stored blood during hysterectomy and was in good condition for seven hours postoperatively when she began to bleed from the abdominal wound. Administration of vitamin K intravenously stopped the bleeding promptly and the patient's postoperative course was uncomplicated further.

Dr. Mason: With all the activity that attends a case of this type, individual minds are on dif-

ferent things, and it is not difficult to overlook the obtaining of data that might be of value. For instance, prothrombin determinations and other blood studies might have been most revealing.

Lawrence H. Tarte: In reading up on this case, I noted an article reporting a case quite similar to this in many respects. Their treatment differed from that used here only in that cortisone was tried and the patient did recover. She seemed, in fact, on admission, in worse condition than this patient. She was in a coma with jaundice and had severe hemorrhage following delivery. They used calcium along with their blood replacement. But, they attributed the recovery largely to the use of cortisone. This may be something to consider.

Dr. Myers: Did the protocol say that the patient received only 25 mg. of chlorpromazine?

Dr. Mason: I believe that is correct. That was two or three days before she was hospitalized. Do you care to make any comments about the dosage?

Dr. Myers: I was just wondering if she had had chlorpromazine earlier in her pregnancy.

Dr. Mason: She had not had it before and she did not have more than the 25 mg. dose, which I would be inclined to discount as causing any combined effect or enhancing action when hooked up with the barbiturates. One would think that a small dose of chlorpromazine, three days before barbiturates, would have been metabolized and excreted long before secobarbital was given.

A Physician: When a patient has a sulcus laceration and a cervical laceration and possibly a uterine laceration, I do not know if the term *outlet forceps* is applicable to the delivery. Was it truly an outlet delivery with such an extensive laceration at the time of delivery?

Dr. Codling: It was truly an outlet forceps, and a very easy delivery. Part of the condition present seemed to be the poor quality of the tissues. It was like sewing wet cardboard. The sutures just tore out. The patient's tissues had no normal resistance or turgor. It reminded me very much of a pregnancy patient who had extremely severe gallbladder disease. She was on a most rigorous diet during her pregnancy, and at delivery presented the same type of friable tissues.

Gross Pathology

Frank Placek: The only external change of note was slight icterus of the skin and sclerae. There was no significant hemorrhage around or in the recent wound. The abdomen contained an estimated 500 cc. of bloody, but watery, fluid. The sutured stump of the cervix appeared intact. The pelvic peritoneum was bluish over the lateral walls and up over the bladder due to an estimated 200 cc. of collected blood clot. The liver, weighing 1050 Gm., was small for an individual weighing approximately 120 pounds. Its edge was blunt and above the right costal border. The capsular surface appeared smooth but strikingly yellow and without evidence of hemorrhage. The surfaces made by section of the liver appeared a light yellow-tan.

Aside from a mild hydronephrosis and hydroureter on the right, thought related to the pregnancy, the kidneys showed no noteworthy change. The lungs, heart, adrenal glands, pancreas, spleen, and gastro-intestinal tract were normal.

A Physician: Do you have any idea of the amount of blood in the left broad ligament?

Dr. Mason: It was not over 200 cc. at the most.

Microscopic Pathology

Charles C. Reberger: Dr. Smersh was correct in drawing attention to the more obvious cases. Before we start this discussion, I think that it should be pointed out that there have been only 14 cases reported so far in the literature of this particular disease complicating pregnancy. The most recent article was a review of the literature with a report of 3 cases by Ober and LeCompte[1] in the *American Journal of Medicine* in which they cited Sheehan's earlier work in 1940. He collected 6 cases out of 400 autopsies at his own obstetric hospital. They have termed the disease which we find in this patient as *acute fatty metamorphosis of the liver associated with pregnancy.* Sheehan[2] had used the term *obstetric acute yel-*

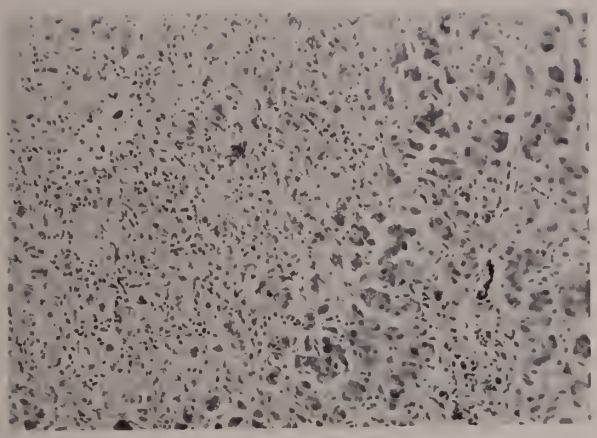

Fig. 1. Preserved liver cells in the portal zones (lower right). A central vein is seen in the upper left corner.

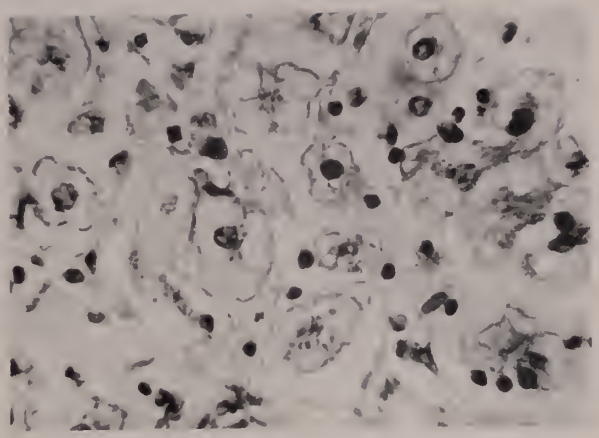

Fig. 2. Showing preservation of liver cell nuclei and multiple fat vacuoles in the cytoplasm.

low atrophy of the liver but recognized that true necrosis of the liver cells did not occur. In fact, the dramatic difference in these cases and those of the infections or toxemias is the presence in the latter of necrosis of the liver cells. In this particular condition, there is complete lack of necrosis of the liver cells.

In acute hepatic necrosis there are hemorrhagic zones, large areas of complete degeneration of liver cells and not much inflammatory exudate. Higher power of the same thing shows nuclei which are faded, other areas where the nuclei are completely gone and liver cells which show no particular features except for perhaps a slight increase of granularity of their cytoplasm.

Figure 1 shows a few peri-portal cells that are not altered. Approximately the remaining four-fifths of the liver lobule shows the feature of distention of the liver cells with vacuoles which one sees in the ordinary fatty liver. These vacuoles tend to be clear, small and multiple (Fig. 2). Sheehan has described these cases quite vividly as occurring in the third trimester of pregnancy, usually the thirty-sixth to fortieth week of pregnancy. The patient will complain of nausea, vomiting, sometimes epigastric pain, sometimes headache. Their course is one of rapid deterioration. Chemistry done on patients of this type indicates severe liver damage with tragic increase of circulating amino acids, decrease in the urea nitrogen (both in the blood and in the urine) and in some cases there has been a marked fall in the prothrombin concentration.[3] One of the cases reported by Ober and LeCompte had a prothrombin concentration of 11 per cent of normal. Apparently, Ober and LeCompte in their series of patients had the same difficulty we are having here—that is, the therapeutic problem of how to keep the patient alive and not really sufficient time to do all the laboratory work one would like to do.

Fat stain showed that the material within the vacuoles is actually fat. It has been determined that most of the fat is in the form of fatty acid —not neutral fat. Droplets in cytoplasm of epithelial cells of the proximal convoluted tubules were fat. According to Ober and LeCompte, this change may or may not be present in given cases.

In summary, this is an unusual condition. It may be unusual in that it has been observed in only the past few years. The actual process by which it occurs is rather hazy in most investigators' minds. It has been found that it simulates the condition seen in certain forms of experimental carbon tetra-chloride intoxication and in the livers of animals fed on protein-deficient diets. It also has been seen in the female rat fed on a diet high in ethionine which apparently is a metabolic competitor for methionine. It is not seen in male rats fed ethionine. The rats have had some improvement after administration of protein hydrolysates, methionine, and choline but this has not been duplicated in the human being. As we know, methionine and choline as therapeutic agents in the human being are still subject to considerable question.

Only 1 case lived out of the 14 which Ober and LeCompte collected. This patient was a 30 year old Chinese who developed nausea, anorexia and jaundice four weeks prior to term. She was also stuporous. She delivered a live baby by cesarean

section. At this time a liver biopsy was done. This demonstrated the same type of change which we see on this series of slides shown. This patient recovered after a very stormy clinical course.

Dr. Day: Is there any evidence of damage to the fetal liver or fetal kidney?

Dr. Mason: It has not been described.

A Physician: In this case?

Dr. Mason: We do not know. There was no autopsy done on the fetus.

A Physician: Did all the cases occur in the last trimester?

Dr. Mason: Yes, that is right. This person was right at term. Most of the reported cases had nausea, vomiting and epigastric pain, followed by deepening jaundice. The symptoms began two or three weeks before the baby was expected. Clinically, the cases are indistinguishable from acute infectious hepatitis.

A Physician: Is this a form of toxemia of pregnancy?

Dr. Mason: The etiology is not known. In reported cases there has been no evidence of dietary deficiency or of exposure to exo-toxins. It is felt that the condition in some unknown manner is related to an endogenous alteration in metabolism.

Dr. Myers: Just as a matter of interest, did laceration of the cervix extend up into the lower segment?

A Physician: No, it did not.

Conclusion

Dr. Codling: In summary, it seems we are dealing here with a new entity or one seldom recognized. Certainly, it was entirely foreign to me—this so-called "fatty metamorphosis of the liver associated with pregnancy."

I was drawn into this case by the unusual hemorrhage. I was asked to give a helping hand in the cutdown for the transfusions while Dr. Nisco was trying heroically to repair some rather minor lacerations in the face of tremendous vaginal bleeding. The cervical tear was minimal, requiring two or three stitches.

There were multiple small tears, resulting, as I said, from poor tissue and not from a traumatic delivery.

There were three objective findings besides shock: (1) jaundice, (2) coma, (3) exsanguinating hemorrhage. Because of the suspected liver impairment, we gave 3 units of fibrinogen, hoping to offset the failure of blood clotting that was manifest. The bleeding never was controllable. Many transfusions were given; hysterectomy finally resorted to, and the patient died a liver death.

Cause of this disease can only be postulated on lowered liver reserve. Somewhere in the liver cell there are several factors, such as methionine, choline and vitamins, working in concert to keep the liver going. Now, perhaps, at term pregnancy, the tremendous amounts of estrogen that have to be detoxified puts too great a load on the liver and acts as a precipitating factor. Perhaps extoxins or endotoxins play a role to produce this fatty change in the liver cell.

Ober and LeCompte suggest certain therapeutic approaches if an antemortem diagnosis can be made and therapy is to be evolved:

1) Needle biopsy of liver to see what you are dealing with.
2) Fat free, high protein intake.
3) Parenteral fluids and vitamins.
4) Emptying the uterus.

In closing, may I remark here that in the last two years there have come to our attention two alarming obstetric conditions. One is afibrinogenemia, and we are making nice progress in its recognition and treatment. Now comes the fatty metamorphosis of the liver to threaten our mothers. At least we can now recognize, diagnose and treat it, perhaps—and perhaps can also save a mother. •

Close Your Wounds

David E. Sullivan, M.D.
SPOKANE, WASHINGTON

Surgical principles of wound care are well established and have been widely disseminated. Yet their importance is so great that they bear frequent repetition and clarification. Selected for discussion here is the fundamental of wound closure. I should like to make a plea for the early closure of wounds, list the advantages of such management, and outline the more common maneuvers that have proved useful.

A Plea for Early Closure of Wounds

Immediate closure of wounds is carried out as a matter of course in the commoner types of wounds, such as surgical incisions and ordinary lacerations. But what of the wounds associated with loss of tissue—the amputated finger-tip, the avulsion wound, or the third degree burn? These too should have the benefit of early closure. But all too frequently they are left open to "drain." All too frequently they are simply dressed and allowed to granulate and heal by scarring. The resulting impairment of both function and appearance is then ascribed to inevitable consequences of the wound itself rather than to poor wound management, as it should be.

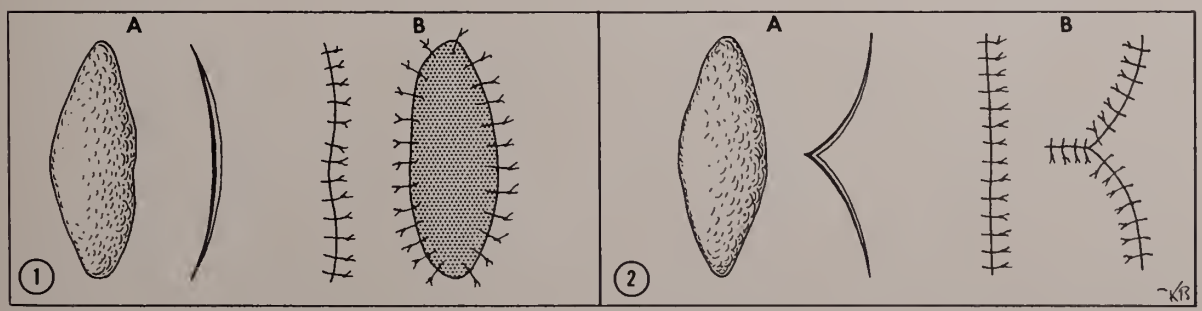

Fig. 1 Wound defect on left, resulting directly from trauma or from excision of devitalized tissue. Relaxing incision on right allows shift of tissues and immediate closure. Secondary defect closed with split-graft. Fig. 2 Wound defect closed by using a V-shaped relaxing incision. Secondary defect closed by suturing in a Y.

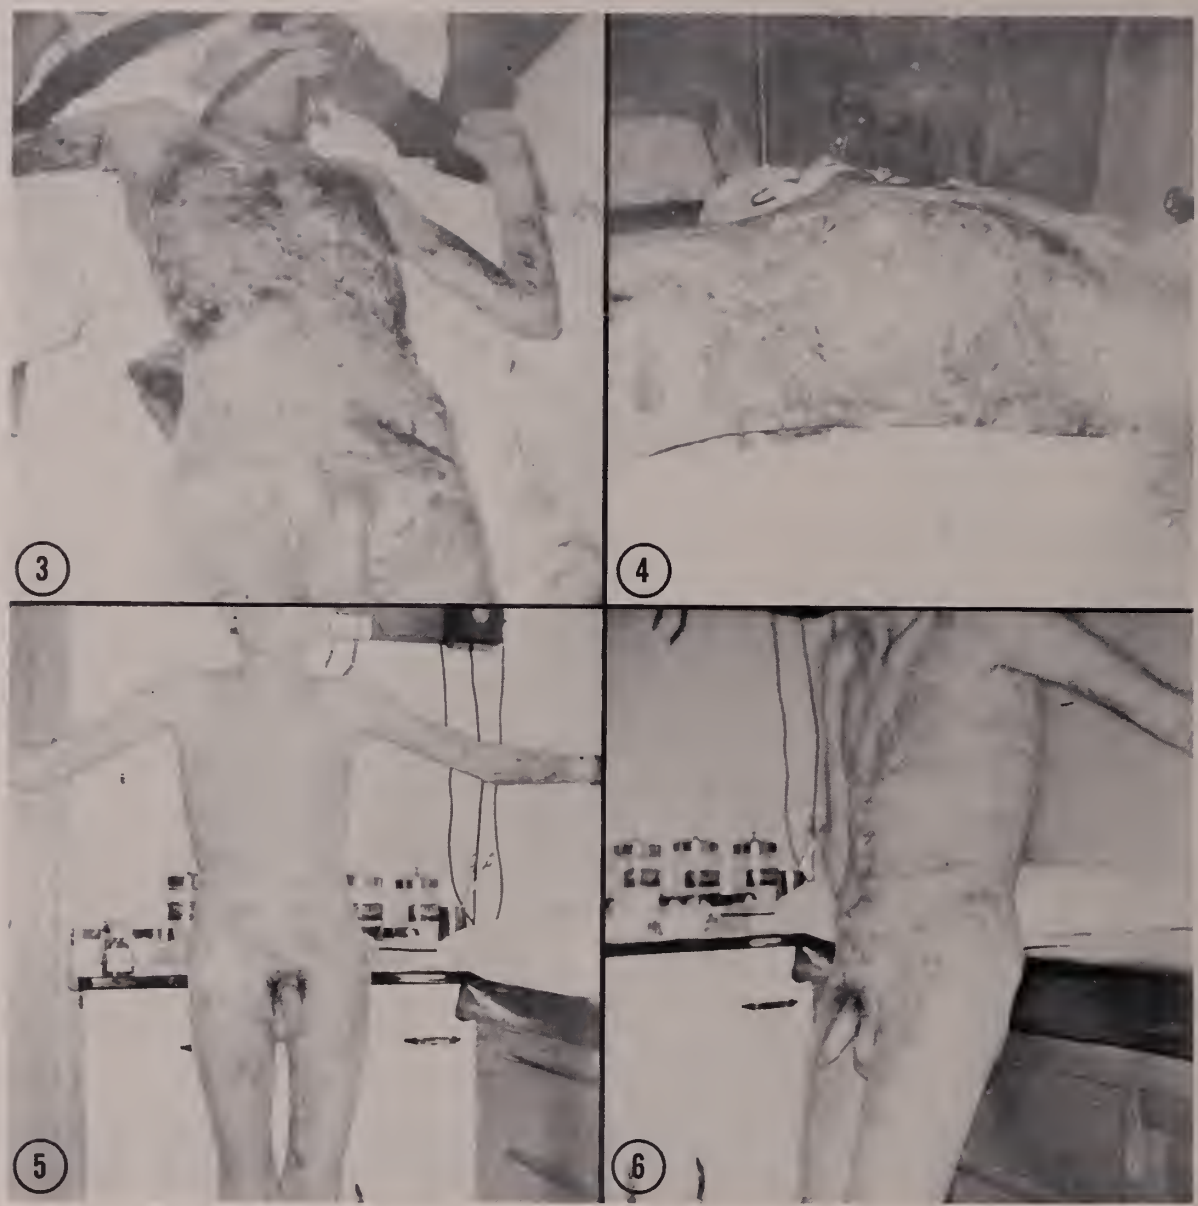

Fig. 3. Extensive third degree burns from tractor radiator coolant. Fig. 4. Burns involved both sides of trunk as well as anterior aspect. Fig. 5. Wound closed with thin split-gratts from back and legs. Fig. 6. Early coverage prevents protein depletion, scar contractures and other complications.

A common excuse for prolonged delay or neglect of early closure of wounds is that the patient's general condition will not permit the additional stress of a general anesthetic. Definitive wound care can often be carried out early under local or regional anesthesia, while resuscitative measures are being carried out simultaneously.

Early wound closure includes both primary closure and delayed closure. Sound surgical judgment is needed in deciding which method is indicated in a specific case. Surgeons who managed many wounds in the Armed Services need not be reminded of the advantages of secondary suture, or of the sometimes disastrous effects following primary closure of a grossly contaminated or infected wound.

Most open wounds encountered in civilian practice lend themselves to primary closure. The favorable circumstances in which the wound is incurred and the short interval between the injury and definitive care permit this.

There are some wounds, however, which are so badly contused and contaminated that delay-

Fig. 7. Late radiation effects on lower nose with chronic ulceration. Fig. 8. Pedicle delayed on scalp and left forehead. Fig. 9. Pedicle in place. Only hair-free forehead skin is used for permanent coverage on the nose. The hair-bearing scalp serves only to carry the blood supply. Fig. 10. The extensive open wound on the scalp and under side of the pedicle is closed with an intermediate split-graft to prevent infection, drainage and exuberant granulations. Fig. 11. Pedicle flap has been sectioned and inset. Scalp pedicle has been returned to its original position, after removing all of split-graft except small portion on left upper forehead, which will serve as permanent cover.

ed suture must be the method of choice. Wounds inflicted by farm accidents, explosions and tornadoes often fall in this class. The possibility of mass casualties from civilian disaster or atomic attack is always with us. Under such circumstances the longer delay between infliction of wounds and their treatment, as well as the severe contusion and contamination of wounds, will require handling along the lines of military casualties in the field. This will include wound cleansing and debridement, application of sterile dressings, systemic antibiotics and tetanus immunization, followed by secondary wound excision and closure on the fourth to seventh day.

Even less common are wounds that should not be closed at all because of danger of anaerobic infection. Certain penetrating wounds and bites, especially human bites, are examples.

While early closure of open wounds is the treatment of choice in all areas of the body, it is

Fig. 12. Surgical defect created by excision of most of lower lip and large section of underlying mandible for persistent squamous cell epithelioma. Immediate closure has been outlined, using large advancement flaps from either side. Fig. 13. Wound closure after healing is completed. Fig. 14. Reconstructed lower lip is tight but functional. No evidence of persistence after five years.

particularly important in certain areas and tissues. Hands comprise one of these regions. In the management of a wounded hand, early or late wound closure often means the difference between a good functional result and a poor one. Prompt closure is required in wounds which penetrate any of the body cavities. Open wounds of joints seriously jeopardize their integrity. Joints must be debrided of all foreign matter and devitalized articular cartilage, irrigated freely with saline, and then closed immediately. Cartilage in general should not be left exposed in a wound. Otherwise it is prone to low-grade drawn out infection, and the cartilage is extremely slow to sequestrate. Since cartilage does not accept a split-graft at all well, it is better to cover bare cartilage with soft tissues, either sacrificing enough cartilage to allow the soft tissues to be closed over it or covering the exposed cartilage with a pedicle flap. Early coverage of exposed dura or brain is likewise most important. Eyelids so disrupted as to expose the eyeball must have their continuity restored promptly in order to protect the globe, utilizing lid adhesions, rotation flaps and any other maneuver necessary.

Advantages of Early Wound Closure

1. Early wound closure provides the best possible barrier to infection.

2. It effects maximum conservation of tissues. When the wound is left open, subsequent infection, edema and fibrous contraction destroy tissues, converting a simple problem into a complex one.

3. It minimizes the inflammatory reaction, which includes edema.

4. It reduces pain and the need for frequent dressings.

5. It stops the loss of fluids, protein and electrolytes. It thus prevents the development of nutritional problems seen in extensive wounds such as third degree burns which have been left open for many weeks. These nutritional problems, in turn, delay healing.

6. It minimizes scarring and contractures, and makes for better blood supply to the part.

7. It speeds healing and facilitates early motion.

8. It minimizes the period of hospitalization and disability as well as time-loss from work.

9. It contributes to the maximum functional result obtainable.

10. It reduces the need for secondary repara-

tive or reconstructive surgery. In the occasional case where they are still needed, it aids materially in achieving the best possible functional and cosmetic result.

Helpful Maneuvers

In the vast majority of soft tissue wounds, closure can be carried out simply and directly, employing time-honored principles. These include thorough washing of the surrounding skin while protecting the wound; irrigation of the wound itself with saline; removal of foreign bodies, dirt and devitalized tissue; respect for and gentle handling of tissues; accurate and complete hemostasis; preservation of blood supply; use of fine ligature and suture material (stressing non-absorbable sutures in clean wounds); closure in layers using sutures to approximate and not strangulate tissues; pressure dressings; immobilization and elevation.

Less commonly, wound closure is complicated by the absence of an appreciable amount of tissue, due either to avulsion by the injury or to necessary excision of devitalized tissue during definitive wound care. Certain maneuvers are available to help in the early closure of these clean but complicated wounds. Those who assume responsibility for the management of wounds should learn and employ these maneuvers. They should not resort to protective dressings and systemic antibiotics, waiting for the wound to close by second intention.

The simplest of these maneuvers is undermining and advancement of wound margins. If the possibilities of this simple technique were fully appreciated and utilized, many patients would be spared delays in healing, prolonged morbidity and disability, extensive scarring and reduced function.

In cases where undermining and advancement of wound margins is not quite enough for wound closure, or where the resulting tension on the wound is too great, relaxing skin incisions can be very useful. The secondary wound thus created should in turn be closed, either with a split-graft or by a plastic procedure such as the V-Y (Figs. 1 and 2).

Few wounds require the addition of free skin grafts to complete closure. But where such additional coverage is required, one should not hesitate to use it. Furthermore, it is usually best done at the time of the original definitive care, not waiting for the wound to granulate. The

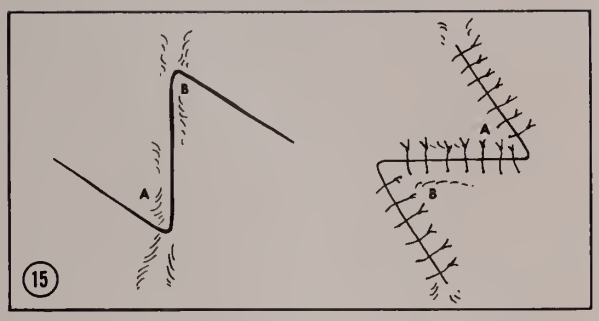

Fig. 15. Z-plasty, used most frequently to release contractures.

advantages and disadvantages of different thicknesses of free skin grafts should be kept in mind. Thin split-grafts are most certain to "take," even on a granulating bed (Figs. 3, 4, 5 and 6). On the other hand, they undergo marked contraction and do not wear as well as thicker grafts. Thick split-grafts contract less and stand up to wear and tear better, often providing permanent coverage. However, greater care is required in their application and they are less certain to "take" in their entirety. Intermediate split-grafts combine both the advantages and disadvantages of the above. It is important to remember that split-grafts may be used for wound coverage to achieve early healing, and then be excised later for considerations of improved appearance or function (Figs. 7, 8, 9, 10 and 11).

Full thickness skin grafts and composite grafts are rarely indicated in the primary closure of wounds. Technique of handling them is most exacting. Consequently they find their greatest application in secondary and reconstructive surgery. "Pinch" grafts, "sieve" grafts and other similar grafts are not recommended because the result is unsightly in both the donor and recipient areas, and because the appreciable scarring which attends their use detracts from the functional result.

Also uncommon in early wound closure is the need for pedicle flaps. These differ from free grafts in that they remain attached to the body and draw their blood supply through their base, or pedicle. Rotation flaps are taken from the margin of a wound and used to cover a critical area. The donor area from which the flap is taken is closed either by undermining and advancing the wound margins or by coverage with a split-graft. Rotation flaps and advancement flaps find their most frequent use about the face, scalp and neck (Figs. 12, 13 and 14). They are also utilized in extremeity wounds to cover bare

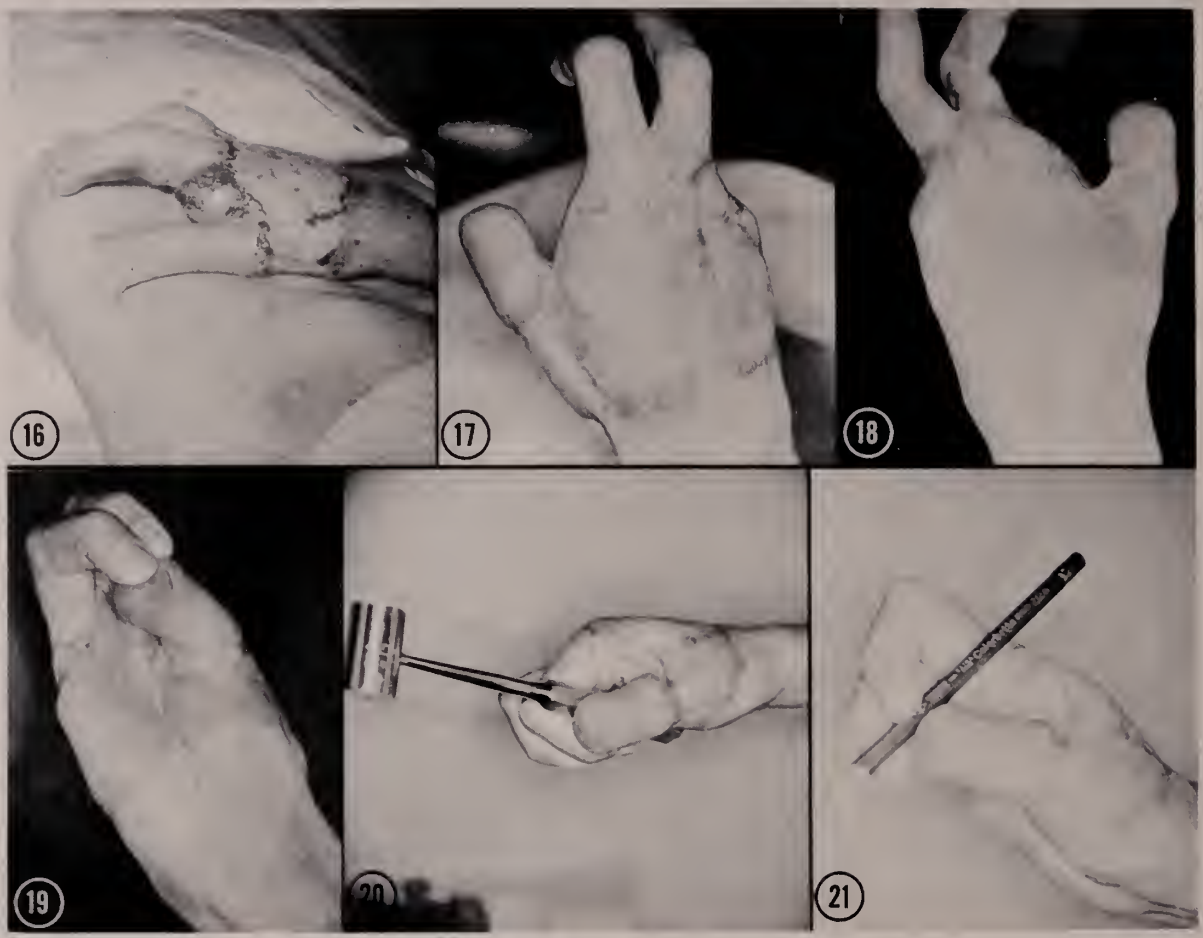

Fig. 16. Salvage of a hand severely traumatized in a dough-mixing machine. Devitalized index finger, little finger and most of thumb had to be excised. Remaining proximal phalanx of thumb, devoid of tendons or nerves, was covered with a single pedicle tube from the left abdomen. Fig. 17. Split-graft on dorsum of hand and tube pedicle on remnant of thumb after healing is complete. Fig. 18. Healed split-graft on palm. Surviving middle and ring fingers extended as much as possible. Fig. 19. Fingers flexed as much as possible, meeting shortened thumb. Demonstrates principle that if stiffening of finger joints is inevitable, the reduced range of motion will provide maximum function possible if fingers are held in position of semi-flexion while healing takes place. Fig. 20. Provision of a thumb which can be opposed to remaining fingers gives grasping action. This patient now makes his living using a telegraph key with his right hand. Fig. 21. Pincer action, as in writing with a pencil, is likewise most important.

bones, joints, tendons, and occasionally major blood vessels and nerves. Z-plasties comprise a special type of rotation flap (Fig. 15). They are used occasionally in the primary closure of wounds in order to prevent development of contractures. They are used most frequently in secondary reparative surgery to release contractures already formed.

Flaps from a distance represent still another maneuver which is frequently employed in reconstructive surgery, but which can on rare occasions be utilized to advantage in the early closure of wounds. Cross-finger flaps should find wider application in finger injuries as their many advantages are more fully appreciated. Somewhat less advantageous as an alternative to shortening fingers in order to close wounds are palm-to-finger flaps and cross forearm flaps. More extensive wounds on the fingers and sizeable avulsion wounds elsewhere on the upper extremity are often best covered by an immediate pedicle from the trunk (Figs. 16, 17, 18, 19, 20 and 21). Likewise in extensive avulsion wounds of the lower extremity exposing bone, joint or tendon, where a free graft will not provide adequate cover, an immediate cross-leg flap will solve the problem very adequately. Such flap coverage on extremities provides excellent skin cover in cases requiring secondary surgery on bones, joints and tendons.

One or more of these maneuvers may be required in a given case. Part of a wound may be closed by direct suture of the margins, while a split-graft is required to close the rest. If at all possible, close the wound in one operation and not in stages. When it appears unlikely that a split-graft will survive, use a pedicle flap.

Summary

Wound closure, one of the important fundamentals of open wound care, is selected for discussion. The vast majority of wounds encountered in civilian practice lend themselves to primary closure. Most of those remaining, in which the circumstances are not quite so favorable, can be closed by secondary suture on the fourth to seventh day. A plea is made for early closure of wounds, including the more complicated ones with loss of tissue.

Early wound closure provides many advantages. It prevents infection, conserves tissue, minimizes inflammation and scarring, speeds healing and contributes to the best possible functional and cosmetic result.

Those who assume responsibility for the management of wounds should learn and employ maneuvers which have proved useful in the closure of wounds complicated by loss of tissue. The commonest of these maneuvers includes undermining and advancement of wound margins, relaxing incisions, the V-Y procedure, split-grafts, full thickness skin grafts, local pedicle flaps and pedicle flaps from a distance. One or more of these maneuvers may be indicated in a given case.•

Publication Plethora

The great majority of subscribers to the *Gazette* receive their copy by post, and this is another issue which joins the rising tide of medical literature which daily thuds, plops or flutters on to the pile beneath the letter box in so many homes. As an old-established institution, the *Gazette* may legitimately look around and blink at the number and variety of publications which join it in print week by week, and may ponder the problem they present more and more forcibly—where to begin and how many to read? Where once the standard journals, with their reports of original work and their annotations of clinical advances, could be regarded as the obvious means by which isolated medical men might keep abreast of their colleagues in the fields of research and of clinical specialisation, the situation confronting today's doctor is complex in the extreme. Journals range from Hansard-like accounts of learned societies and their doings through the specialist organs of confessedly limited appeal, to the publicity products of pharmaceutical firms, which form an increasingly important part of the volume of reports of original research and advances in treatment. The student, to whom journals are available at bargain prices, and who is presented with the glossy and extremely attractive publicity magazines, may reasonably feel despondent at the volume of printed matter which is thus added to the textbooks on his shelf. A recent correspondent in the *British Medical Journal* points out that in the proliferation of medical literature, the difficulty is that there is something of value in almost everything that is published. Many of us have learned to glance through the summaries of papers before deciding which ones to read, while we have all heard apocryphal stories of the cupboard doors throughout England which, if incautiously opened, release an avalanche of those solid cylinders, the tightly wrapped weekly journals. A pleasant relieving factor in the general melee is exemplified by journals such as the *Gazette,* which mingle clinical articles with news of a particular hospital and its work; its staff and its patients, their sports and activities, linking past and present members of a living community. The readiness to add to the volume of medical litarature thus evinced by doctors and firms, is more than matched, however, by the eagerness of the public to read medical information of almost any description, which leads to success stories such as that of *Family Doctor.* The clearing of the Victorian clouds and cobwebs of false modesty has led to a rebound phenomenon of which the merits are in extreme cases, in some respects debatable. It has been said that doctors, with photographers and fortune-tellers, are the men most irresistible to the egoist in each of us. Certainly this fascination, allied with the volume of honest inquiry, leaves no doubt that the supply of medical literature for the layman is still far from outstripping the demand.

Control of Bleeding After Dermabrasion

WALTER SCOTT BROWN. M.D.
SEATTLE, WASHINGTON

Methods of eliminating scars, pits and blemishes from the skin have concerned the physician and patient throughout medical history. It is noted that the Papyrus Ebers,[1] 1500 B.C., the oldest medical document extant, prescribes an abrasive ointment designed to make the skin smooth. Needs and desires for a better method of removing scar tissue have been so motivating that many methods have been suggested and used. Some of these are acupuncture, scarification (multiple incisions), electrodesiccation, surgical shaving, surgical excision, chemical caustics, cryotherapy, abrasion and dermabrasion with ethyl chloride. All of these methods, of course, tend toward the same purpose of removing the lesion in equivalent area and depth. When the lesion is removed no visible scar should result.[2]

The use of dermabrasion in removal of scars, pits and blemishes has reached a point of widespread acceptance.[2-6] Even though this technique is not flawless, it has offered a good approach to a difficult problem.

One of the drawbacks of the dermabrasion method of removing scar tissue has been the oozing type of bleeding encountered during surgery and in the postoperative period. A review of the literature demonstrated that Adrenosem Salicylate has been used widely in many fields of surgery[7-15] such as tonsillectomy, adenoidectomy, osteoplasty, alveoloplasty and in many other procedures which called for control of capillary bleeding. My own experience with it has been in rhinoplastic reconstruction, skin grafts, cleft lips, cleft palates, rhytidectomies, scar excisions and other types of plastic procedures.

The purpose of this article is to offer a preliminary report on the use of Adrenosem Salicylate, a systemic hemostatic agent, in dermabrasion procedures in an attempt to evaluate its ability to control bleeding, primarily that which occurs postoperatively.

Evaluation

In an attempt to evaluate the drug in the light of procedures which might be fair to it and to the surgeons who may find indications for its use, I thought of many methods of study. I was seeking a reasonably accurate method of determining its effect as well as an adequate and accurate method of determining the amount of blood loss without and with the drug. It was decided that the most ideal operative procedure would be that of face sanding or dermabrasion, because the two areas of bleeding surface could be controlled accurately to be of equal extent. Thus the cheek was decided upon.

Procedure

A method of calculating the blood loss was most important in order to evaluate the hemostatic effect of the drug correctly. My procedure was to transfer the blood soaked sponges into plastic bags immediately and then seal the bags to prevent evaporation. After surgery, the plastic bags were opened and dried in a 37 C. oven to constant weight. While the difference in weight would not give the weight of blood loss directly, it was calculated by a standard figure which was established by using a measured quantity of blood with the same type sponges and plastic bags.

Dermabrasion was carried out under general

or local anesthesia, depending on the patient and requirements. Operating procedure was the same for both cheeks, excepting the administration of Adrenosem Salicylate prior to surgery on the second cheek. The first cheek was operated on as required with all sponges being placed in a plastic bag. When the operation on the first cheek was completed, a clean sponge was placed over the area and removed after 10 seconds. After 30 seconds the cheek was photographed. At this time 2 ml. of Adrenosem Salicylate was administered intramuscularly. After a 30 minute lapse, which I thought adequate time for the drug to take effect, the operating procedure was repeated on the remaining cheek in every detail, including sponging and photography. This same sequence in photography was followed in all cases photographed.

Cases

Over the past two years I have completed approximately 200 dermabrasion procedures in which this technique was used. Since this is intended to be only a preliminary report, I will not endeavor to list all of the patients and histories, but am presenting the average findings in the cases accomplished and the most successful and the least successful of all cases mentioned.

The accompanying photographs show the areas operated by dermabrasion with and without treatment with the hemostatic agent.

Case 1 represents the least variation in numbers in which the number of sponges was reduced from 18 on the untreated side to 8 on the treated side. The calculated weight of blood loss was reduced from 31 Gm. on the untreated side to 11 Gm. on the treated side.

Case 2 represents the greatest variation in numbers. The number of sponges was reduced from 48 on the untreated side to 29 on the treated side. The calculated weight of blood loss was reduced from 173 Gm. on the untreated side to 80 Gm. on the treated side.

Averaging the calculated amount of blood loss between the treated and untreated cases of the entire series, I found that after treatment there was an average calculated reduction of loss of 47.9 Gm. of blood per patient. It is interesting to note that the variation was uniformly greater in all cases where a general anesthetic was used than in those where a local anesthetic was used. It is my thought that the epinephrine used in a local anesthetic is of some benefit in controlling bleeding and it is likely that the drug is not quite as effective when used with a general anesthetic, due to some loss of nerve supply to capillaries which does not exist as completely under local anethesia. It should be mentioned that Adrenosem Salicylate is compatible with any type of anesthetic and can be given simultaneously. I mention this because it has been observed[5] that cyclopropane should not be used in conjunction with epinephrine because of the influence of the combined drugs on the cardioregulatory mechanism. Adrenosem Salicylate has no sympathomimetic action. It does not raise the blood pressure significantly or affect the cardiac rate or volume. I also observed no objectionable side effects in any patient, which confirmed reports in the literature,[8-11,13-15] on the absence of side effects and low toxicity.

Summary

An attempt has been made to evaluate effectively a new systemic hemostatic agent. Over 200 dermabrasions and other surgical procedures have been completed using this drug. A significant reduction in blood loss was observed after use of the drug as determined by blood weight, total sponges used and as illustrated by color photography. In my mind, this drug is a valuable aid to plastic surgery in its ability to reduce blood loss and provide a clearer operative field.•

Acute Post-Traumatic Renal Failure

Donald F. McDonald, M.D.
SEATTLE, WASHINGTON

Acute post-injury depression of kidney function without actual physical damage to the kidney is etiologically related to decreased renal blood flow attending the shock of the extraurinary injury, together with a toxic nephropathy occasioned by liberation of hemoglobin or myoglobin pigment. Occasionally the degree of shock and the amount of pigment are not impressive so that the sudden realization that the patient is oliguric or anuric comes as a surprise.

The pathology of the nephropathy which ensues is that of focal tubular necrosis. Generally, healing takes place in 10 to 14 days, but in certain instances clinical cure requires as little as 3 or as many as 30 days. Prophylactic treatment, if it were possible, might prevent the tubular damage.

Prompt treatment of the shock with restoration of blood volume and blood pressure will restore the hydrostatic pressure necessary to glomerular filtration and tubular nutrition. Where large hematomata or necrotic or infected wounds are present, wide incision, debridement, and drainage will decrease the amount of abnormal hemoglobin or myoglobin pigment available for deposition in and destruction of renal tubules.

The diagnosis of acute post-traumatic renal failure devolves on several characteristic associations. The majority of cases of acute renal failure follow a precipitating episode. The ingestion of heavy metals or alkaloids, and transfusion of mismatched blood are well-recognized examples of this, as are multiple severe contusions and lacerations. The characteristic syndrome is that of oliguria of less than 20 cc. per hour, hyponatremia, acute gain in body weight, and elevation of the blood urea nitrogen.

In differentiating toxic nephropathy from other causes of acute oliguria, it is essential that urinary obstruction due to hematomata or preexisting disease be excluded by demonstration that the urinary passages are patent. Most often this can not be accomplished without instrumentation because kidney function at this time is so poor as to preclude satisfactory visualization by excretion urography.

Treatment

Treatment of toxic post-traumatic nephropathy is only symptomatic. There is no known specific therapy which speeds healing of the kidney lesion. It is, however, known that the majority of such lesions can heal spontaneously provided that the patient's electrolyte and water balance are maintained satisfactorily. The treatment consists of water restriction, sodium restriction, administration of calories, removal of the chloride ion, prevention of hyperkalemia, and general supportive measures.

Perhaps the most important consideration is the restriction of water. It is better to avoid administration of oral fluids for several reasons. The volume of parenteral fluids administered should be limited to the amount of urine excreted during the preceding day plus an allowance of 750 cc. for the insensible loss and minus 300 cc. for the water produced by oxidation of food stuffs. An important but little used way of checking on the effectiveness of water restriction

Presented at the annual meeting of the Washington State Chapter of the American College of Surgeons, July 26, 1957, Harrison Hot Springs, B. C.

is daily weighing of the patient. As better bed scales become available, weighing becomes increasingly easier and should be routine. Ideally, the patient should lose a pound a day. An additional way of ascertaining the effectiveness of water restriction is to determine the serum sodium. Since little or no sodium is lost in the urine, decreasing serum sodium indicates overhydration. When the serum sodium is less than 130 mEq. per liter, stringent water restriction is indicated. Any fluids which are given should contain 20 to 50 per cent glucose or 1/6 molar sodium lactate.

Sodium

Restriction of sodium must also be practiced to prevent edema, but sodium must be given to combat hyperkalemia, hyponatremia, and acidosis. Sodium should not be given unless sodium is lost. If possible, treat hyponatremia by water restriction.

Acidosis may be combated by gastric suction and hence it is wise to avoid oral feedings. Another contraindication to oral feeding is that many of the patients are nauseated and are unable to retain fluids. Gastric suction can remove large amounts of chloride. Acidosis can be reduced by giving calories to spare protein breakdown which liberates phosphate and sulfate. Acidosis is further combated by the administration, whenever sodium is advisable, of sodium lactate rather than sodium chloride. But, sodium lactate should not be given when the serum carbon dioxide is greater than 30 mEq. per liter, which is rather unusual in the acute anuria syndrome.

Calories must be given to spare protein breakdown with liberation of potassium, phosphate, and sulfate. Ordinarily, 100 Gm. of glucose per day, that is 200 cc. of 50 per cent glucose, can be given easily. In addition, ethyl alcohol can be given slowly in the amount of 50 cc. daily without intoxication. The administration of hypertonic intravenous solutions is aided by insertion of polyethylene catheters and addition of 10 mg. of heparin per liter of solution.

Removal of chloride is largely accomplished by gastric suction. The gastric juice contains chloride in excess of sodium, water, and potassium. The volume of the gastric aspiration can be replaced with sodium lactate or hypertonic glucose solution administered intravenously as indicated. The sucking of ice chips stimulates gastric secretion and the patients appreciate the alleviation of the dry mouth and thirst which they often experience.

Potassium

Hyperkalemia with its toxicity to the myocardium must be prevented. Calories from glucose prevent liberation of potassium from tissue breakdown. The prevention of acidosis minimizes the cardiotoxic effects of hyperkalemia. Gastric suction may remove 5 to 20 mEq. of potassium daily and is certainly worth-while in treating this aspect of the acute anuria. If hematomata or necrotic wounds are present, thorough debridement and drainage are desirable to obviate absorption of potassium.

When the above treatment, designed to prevent hyperkalemia, is unsuccessful and cardiotoxic effects are recognized by electrocardiography, temporary improvement can be achieved by the administration of 5 Gm. of calcium gluconate plus 20 units of insulin in 50 per cent dextrose every four hours. Sodium lactate added to the infusion aids by inducing alkalosis which decreases the toxicity of the high potassium levels. It may be necessary to resort to extracorporeal dialysis or peritoneal lavage to save the patient from hyperkalemic, cardiotoxic death. This requires considerable special experience, and equipment which is not readily available. Conservative management, when instituted early and assiduously pursued, avoids the need for dialysis.

The Early Recovery Period

In successful cases, sometime between 3 and 30 days, the patient's urinary volume will exceed 1,000 cc. Gastric suction can be discontinued at this time. Oral feedings of high caloric value should be initiated.

The kidneys at this time excrete large volumes of water, but are unable to conserve base. Sodium and potassium depletion must be anticipated. The only satisfactory way of estimating these losses is to quantitate them in the laboratory. When the urine volume, which may exceed 5 L., is high, the best practice is to give fluids equal to the preceding day's output, but not exceeding 3,000 cc. When the urinary sodium loss exceeds 200 mEq. per 24 hours, it should be replaced. This also applies for losses of potassium exceeding 40 mEq. per 24 hours and chloride of 200 mEq. per 24 hours.

A convenient way of estimating the urinary

sodium is determination of urinary chlorides, which is a relatively simple bed-side test. This is reliable if the *p*H of the urine is less than 7, and is a great assistance in calculating electrolyte requirements. However, if the *p*H of the urine is alkaline, sodium loss may greatly exceed chloride, and serial serum sodium and hematocrit determinations are essential to satisfactory management.

Summary

In summary, patients who have severe injuries with shock may liberate hemoglobin or myoglobin pigment, which, in the presence of reduced renal blood flow, leads to oliguria or acute anuria. Prompt treatment of shock and drainage of hematomata may be of prophylactic value. Oliguria, hyponatremia, acute gain in weight and elevation of blood urea nitrogen should be anticipated. Attention to fluid and electrolyte balance should lead to early diagnosis. Administration of large quantities of water and sodium in the immediate post-traumatic period are unwise and often make subsequent management exceedingly difficult. The treatment of the acute anuria syndrome consists of water restriction, sodium restriction, administration of sufficient calories to prevent hyperkalemia and acidosis, removal of chloride and potassium by gastric suction, attention to and prevention of hyperkalemia, and careful replacement of losses during the diuretic stage of recovery.•

AMA to Publish Tabloid Newspaper

The Board of Trustees, meeting in Chicago recently, authorized publication of a new, 16-page tabloid newspaper called *The AMA News.* The newspaper which is in its formative and planning stages is expected to be distributed every two weeks to approximately 200,000 physicians.

It will bring to the attention of members the multitude of projects and activities carried on by the association, as well as all non-scientific news of interest to the profession. Publishing a newspaper for members was selected as a means of improving communications between the association and its members.

The AMA News project was discussed with many people, inside and outside of medicine. In nearly every instance, it was felt that such a publication, built on a news format, was needed.

Physicians wlil be kept informed of what is going on in medicine in all 48 states through *The AMA News.*

The publication will carry advertising, and the editorial staff, yet to be selected, will work at the association's Chicago headquarters.

The first issue is expected to be ready for distribution at the AMA annual convention in San Francisco, June 23-27.

Britain to Boost Health Charges Again

Britain's chancellor of the exchequer announced that contributions to the National Health Service by those using it and by employers would be boosted again in July.

The chancellor told the House of Commons that the whole structure of the social services would be imperiled unless their cost to the treasury was kept in bounds.

The chancellor estimated the cost of the health service during the coming fiscal year at $2,072,000,000.

Carcinoma of the Breast Associated with Pregnancy

Report of Fifty-Six Cases Followed Five Years or More

THOMAS T. WHITE, M.D.
SEATTLE, WASHINGTON

Many patients operated on for breast cancer during pregnancy or nursing survive for long periods. Their survival is comparable to that of patients without these additional problems. Majority of the patients who became pregnant after treatment of their tumors have survived, without evidence of recurrence, for very long periods.

The 56 cases in this series, followed for five years or more, have been collected from six Seattle and three New York Hospitals. In about

2 per cent of all breast cancers seen at several of these hospitals, pregnancy was a factor. In a collected series of 45,881 cases the incidence is 2.8 per cent (table 1). About 10 per cent of women with breast cancer are in the childbearing age group. An incidence of associated pregnancy of nearly one in three would be expected in this group. The incidence of breast cancer in obstetrical services is much lower, about 3 per 10,000 pregnancies (table 2).

Mastectomy During Pregnancy

The 13 patients who had mastectomies during pregnancy are illustrated in the bar diagrams in figure 1. Of the 5 with disease limited to the breast, 2 survived over 14 years; 1 is still alive without evidence of disease after 15½ years (Fig. 2), while the other died of a new cancer in the opposite breast after 14 years. The third patient is without evidence of recurrence after five years. All the patients with axillary spread were dead within four years. All of the local tumors occurred in the first two trimesters of pregnancy, while those with axillary spread occurred throughout pregnancy. Of two patients who

Fig. 1. Thirteen patients having mastectomy during pregnancy. Of special interest are the two long term survivors.

had further pregnancies, one (Case 11) with very advanced disease had a therapeutic abortion without appreciable effect on the course of disease, while the other (Case 2) was allowed to proceed to term with no immediate untoward effects.

Mass Noted During Pregnancy

There were 17 women in whom a mass was noted during pregnancy, but treatment of the

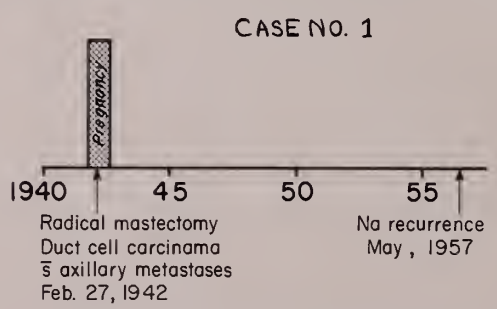

Fig. 2. This patient was operated on in mid-pregnancy with no recurrence after 15½ years.

breast cancer was given post-partum (Fig. 3). Two patients (Cases 15 and 22) noted a cancer during one pregnancy, but had no treatment until the end of a second pregnancy. The other patients were operated on after the first pregnancy. Delay in treatment was the outstanding feature of this group, ranging up to 48 months after the tumor was first noted by patient or physician. Details of each patient may be seen in the bar diagrams. Three patients had localized disease and 14 had spread. Two of the 3 with localized disease survived five or more years whereas only 1 of 14 with spread survived this length of time. Only 3 (Cases 21, 23 and 25) of the group had inflammatory type carcinomas. One had a therapeutic abortion with no obvious effect on the course of her disease.

Treatment During Pregnancy or Nursing

Thirteen patients were treated during pregnancy or nursing when the tumor was found during nursing (Fig. 4). Three of the 5 patients with disease localized to the breast survived five or more years. Two of the 8 patients with metastases survived five or more years. One patient had a therapeutic abortion without appreciable benefit. The delay in treatment in this group was 0 to 12 months—very conspicuously less than in the previous group.

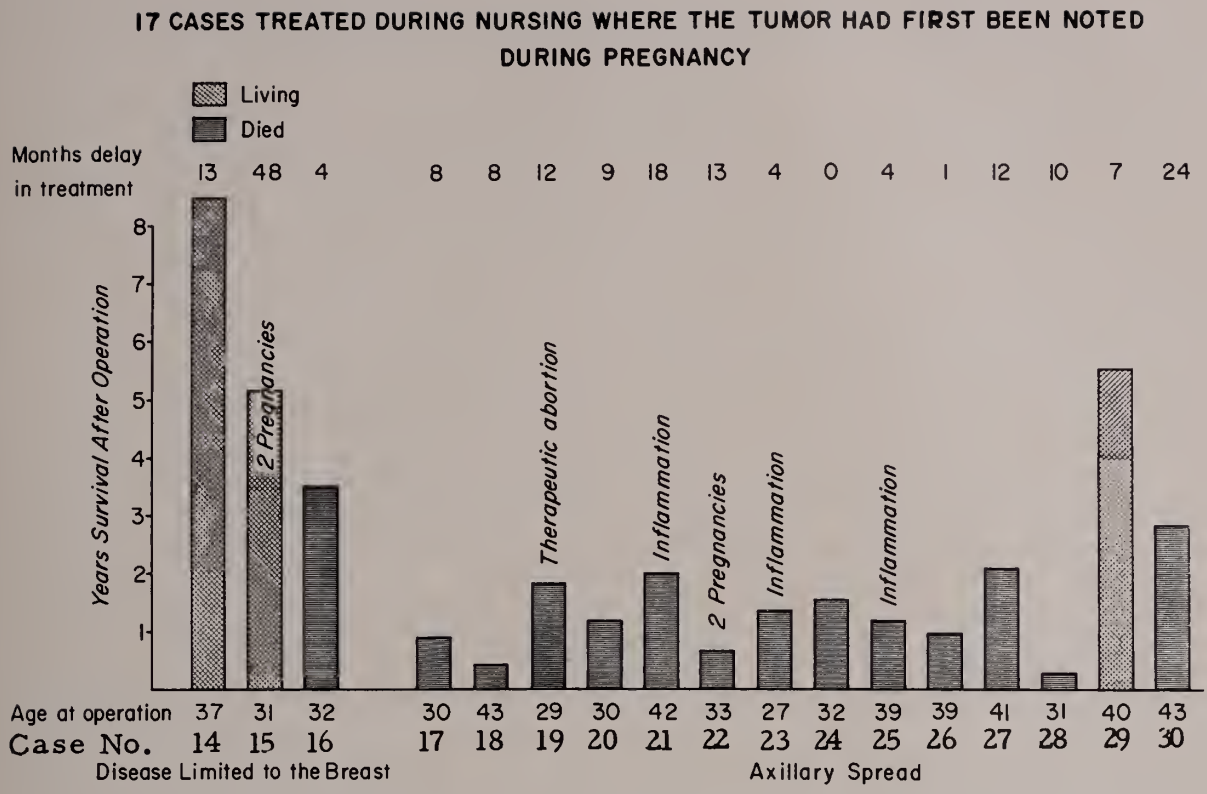

Fig. 3. Marked delay in therapy is the rule rather than the exception in this group of patients operated on during nursing.

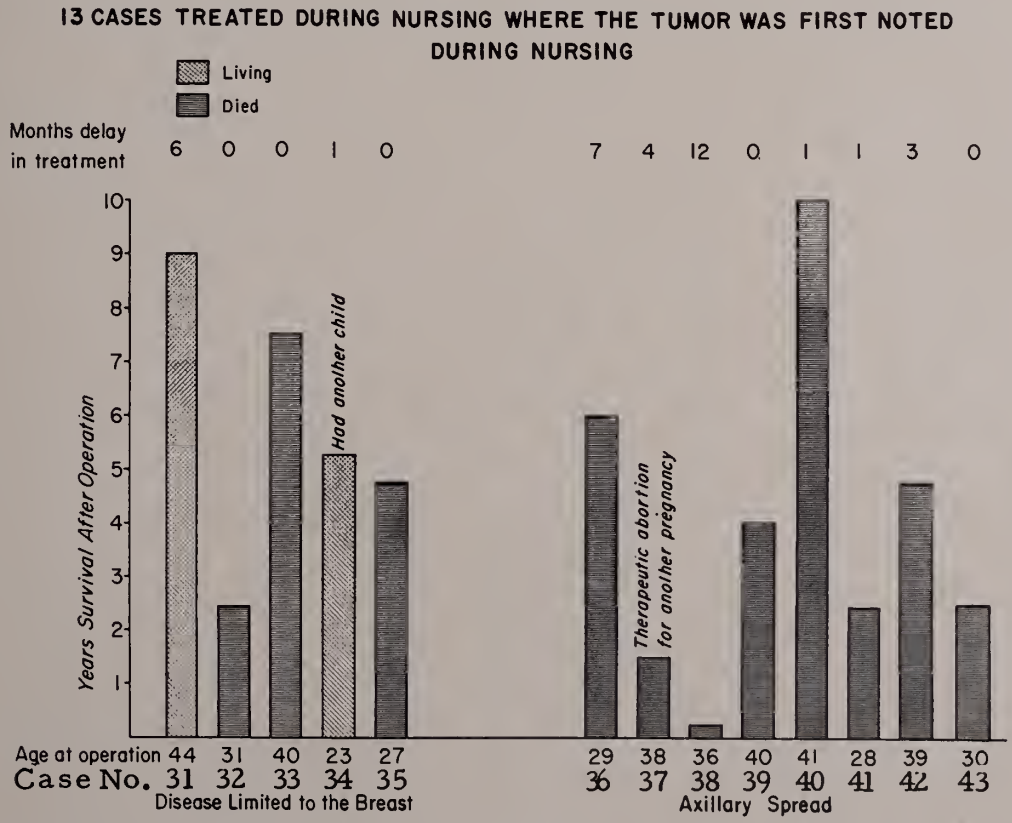

Fig. 4. Both the survival rate and the delay in treatment are much improved over figure 3.

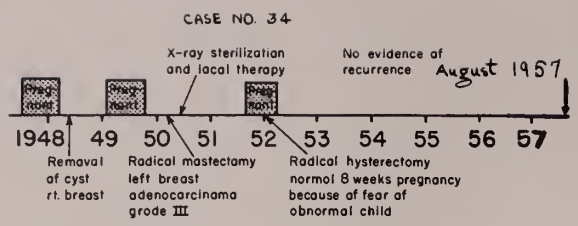

Fig. 5. This patient was still water skiing during the summer of 1957.

One patient (Case 34) (Fig. 5) is an example of a promptly treated patient who had had very little difficulty in spite of the dire predictions of her physicians.

Subsequent Pregnancy

Twelve patients operated on for breast cancer became pregnant later (Fig. 6). Of the 8 patients who had localized disease at the time of operation, all but 1 survived for 10 or more years, 2 for more than 30 years. Case 44 (Fig. 7) is an excellent example of a patient who had two children after mastectomy, and who is without evidence of recurrence 35 years after operation. The few patients with axillary spread were dead within five years. It is of interest that all patients in this group became pregnant within four years or less after operation.

Comparison of My Group with Other Similar Series

There was close correlation between my series and those of Harrington (Mayo Clinic) and Westberg (Radiumhemmet, Stockholm) (Fig. 8). In the three series, most of the patients without metastases and first treated during pregnancy or lactation survived over five years (Harrington 64.5 per cent, Westberg 63.3 per cent and White 61.5 per cent) while the ten year survivors in Harrington's series (54.2 per cent),

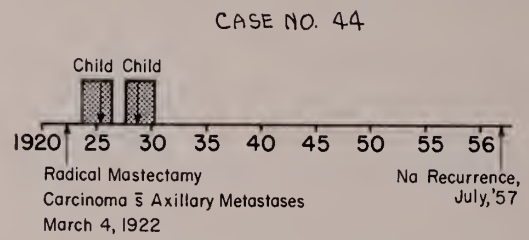

Fig. 7. This patient is working in an editorial capacity 35 years after her radical mastectomy. She had children 31 and 33 years ago, four and two years after her mastectomy.

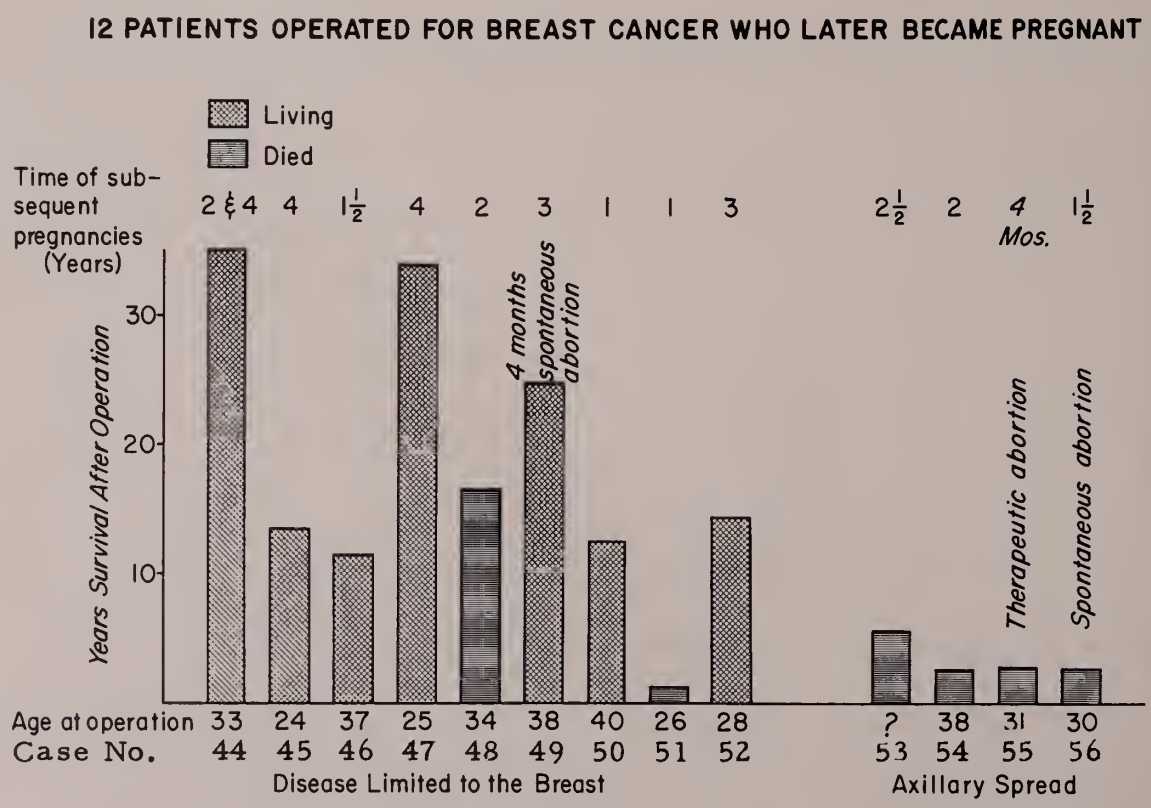

Fig. 6. The long term survivals here are very encouraging.

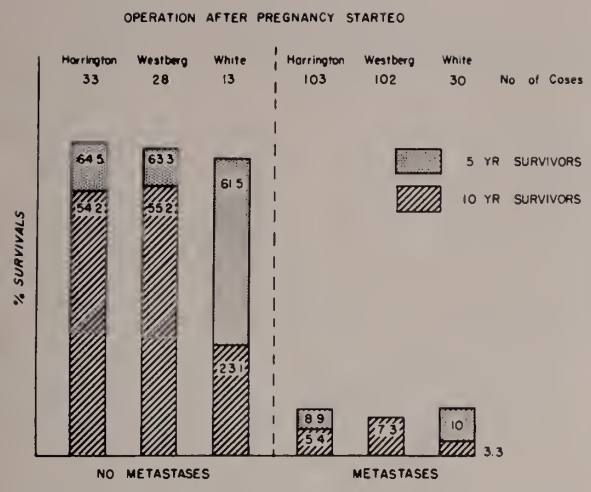

Fig. 8. Comparison between my series and those of Harrington and Westberg of patients operated upon after pregnancy started.

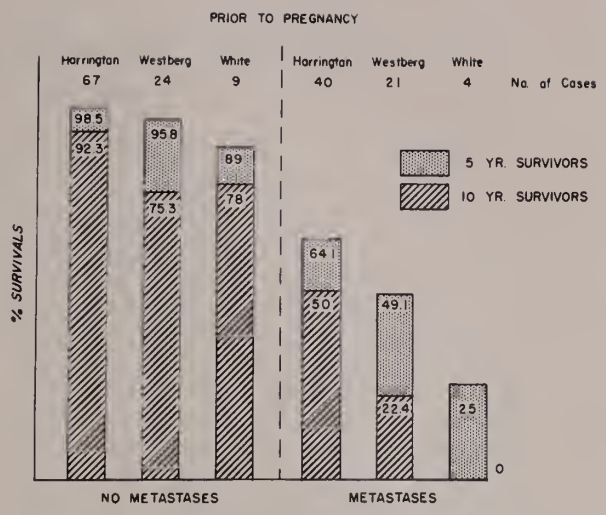

Fig. 9. Comparison between same series as in figure 8 of patients operated upon prior to pregnancy. (Reprinted from issue of June 1955, page 664, by permission of Surgery, Gynecology & Obstetrics.

Westberg's (55.2 per cent) were higher than in my group (23.1 per cent). The five and ten year survivals in all three groups were uniformly poor in the patients with metastases.

The results are also parallel in the groups of patients who later became pregnant (Fig. 9).

The three series are also of interest in that they point up a possible reason for the alleged unusually poor results in patients treated during pregnancy or nursing. Majority of the patients had at least axillary metastases: 103 of 136 in Harrington's group, 102 of 130 in Westberg's collection, and 30 of 43 in my group for a total of 235 out of 309 patients treated (76 per cent). One can only speculate as to whether this is due to delay or due to an inherent change in the tumor at this time.

Summary

1. Many patients who develop breast cancer during pregnancy or nursing survive for long periods of time when treated adequately.

2. Patients with breast cancer and pregnancy are usually in an advanced stage of their disease, and for this reason often do poorly.

3. Although there appears to be some selection of cases, the patients who become pregnant after mastectomy do very well, with an unusually high percentage of five and ten year survivals in this series.

4. Abortion cannot be clearly shown to have a favorable effect on the course of the disease. •

Bilateral Ureteral Ectopia

C. E. Catlow, M.D.
PORTLAND, OREGON

Ureteral ectopia must always be ruled out in girls manifesting urinary incontinence. Furthermore, if ureteral ectopia is found, the possibility of bilateral ureteral ectopia should be considered.

This case report points out two interesting facets of ureteral ectopia; namely, the familial tendency and possibility of bilateral anomaly.

In the male, the ectopic ureteral orifice always lies proximal to the external sphincter (e.g., prostatic urethra, ejaculatory duct, seminal vesicle) hence infection and not incontinence is the most prominent sign. The female, however, heralds her anomaly by incontinence since the ectopic ureteral opening usually lies distal to the sphincter.

Embryology

The embryologists have shown us that the ureteral bud arises from the ventral urogenital cloacal segment near the origin of the Wolffian duct. Subsequently, the ureteral buds migrate medially and ventrally to become incorporated into the lateral portion of the vesical trigone. Failure of migration of the ureteral bud results in ureteral ectopia. When reduplicated ureters have been formed, it is usually the lower ureteral bud (draining the superior pelvis) which is ectopic.

We have been indoctrinated with the fact that when polycystic kidney disease is discovered in a family, it is advisable to inform the family that other members may be so afflicted and should be examined. The same advice should be given to the family when one of the members has been found to have ureteral ectopia.

Diagnosis

The diagnosis of ureteral ectopia should be suspected when there is history of incontinence, night and day, in the female. In the male, the history of repeated urinary infections is suggestive.

Direct examination of the vulva in the female and intravenous pyelograms with delayed films usually will establish the diagnosis. In the male, urethroscopy plus delayed intravenous pyelograms will establish the diagnosis.

In either sex, a high degree of suspicion is the best diagnostic aid.

CASE REPORT

This 6 year old girl was first seen in September, 1955. According to her mother, the girl had "wet pants" all the time. Significantly, I had performed a left hemi-nephro-ureterectomy, for ureteral ectopia, on the patient's older sister, three years previously.[1] Questioning brought out the fact that the patient had been cystoscoped recently and had been declared normal.

Examination of the vulva showed some moisture on the mucosa just beneath the external urethral meatus. I was unable to identify an ectopic orifice, however.

The patient was admitted to a hospital and an intravenous pyelogram, with delayed films, was done. This showed a faint pool of dye in the region of the superior pole of the right kidney, above the normal-appearing pelvis and calices. During cystoscopy, indigo carmine was given intravenously but the dye failed to appear at the ectopic opening. With the history of incontinence, the vulvar findings, and the pyelographic evidence of a superior pelvis in the right kidney, a diagnosis of ureteral ectopia was made. The patient had rgiht hemi-nephro-ureterectomy. An atrophic superior renal pole was removed along with a very dilated and tortuous ureter.

However, following surgery the patient continued to demonstrate incontinence, much to the embarrassment of the surgeon. Subsequently, the patient's vulva was again examined and this time a spurt of urine could be seen coming from an opening in the vestibule of the vagina. I was able to introduce the point of a 25 gauge needle into this opening and inject some opaque medium. The x-ray revealed that the anomaly was bilateral and the patient had a reduplicated superior pelvis and ureter on the left emptying into the ectopic opening. The patient was again taken to surgery and a left hemi-nephro-ureterectomy was done. Needless to say, the patient has been free of incontinence since that time.

Summary

A case of bilateral ureteral ectopia from bilateral reduplicated pelves and ureters has been presented to point out the possibility of bilateral involvement with this anomaly and the importance of a family survey when the anomaly has been diagnosed. •

Internal Mammary Ligation

Isidor C. Brill, M.D.
William M. Rosenbaum, M.D.
Edward E. Rosenbaum, M.D.
and
John R. Flanery, M.D.
Portland, Oregon

Since the turn of the century we have witnessed great advances in surgical methods of treatment in areas previously regarded as purely medical. This is understandable in the light of the unhappy results obtained from medical management of such conditions as brain tumors, lung cancer, and many types of congenital and acquired heart diseases. In general, it might be stated that the growth of surgical methods of treatment in diseased states is in direct proportion to the failure of medical therapy. Thus, in the management of ischemic heart disease, because of the relative failure to obtain lasting results in a large proportion of cases, varied attempts have been made during the past two or three decades to increase the blood supply to the heart by surgical methods. Chief among these may be mentioned:[1]

1. Grafting of extracardiac tissues, such as pectoral muscle (Beck), lung (Lezius), or omentum (O'Shaughnessy) to the myocardium.

2. Cardio-pericardiopexy, produced by spraying the epicardium with an irritating substance such as bone dust, asbestos (Beck), or magnesium silicate (Thompson). A variety of other chemical irritants have been used, including starch, glycerine, formalin, phenol, sodium morrhuate, and sodium aleurate.

3. Ligation of the coronary sinus with or without coronary artery denervation (Fauteux).

4. Operations on the sympathetic nervous system, including cervico-thoracic sympathectomy, stellate ganglionectomy and posterior root section.

5. Transplantation of the internal mammary artery into the myocardium of the left ventricle (Vinberg).

6. Arteriolization of the coronary sinus by anastomosis of extracardiac blood vessels to the coronary sinus, utilizing a vein graft to the aorta (Beck and associates).

Most of these procedures, because they are attended by significant mortality and morbidity, are not suitable for general application.

Recently there has been introduced a new operation—bilateral internal mammary artery ligation—which in competent hands has no mortality and little or no morbidity. Developed in Italy and first reported 18 years ago, the procedure attracted little attention until the appearance in 1955 of a paper by Battezzati, Tagliaferro and DeMarchi.[2] In this country the subject remained largely unknown until early this year when at the 1957 meeting of the American Association for Thoracic Surgery, Glover of Philadelphia reported his experience with the operation in a series of 77 patients.[3]

The Operation

The procedure is relatively simple and it is done under procaine infiltration. A single incision or two small bilateral incisions are made in the second interspace, extending laterally from the sternum 4 cm. on each side and crossing the midline. The incision is carried to the underlying pectoralis fascia. The fascia is cut. The pectoralis major muscle is split in the direction of its fibers over the second interspace for about 3 cm. The intercostal muscles are cut for 1 to 2 cm. at the sternocostal margin. The internal mammary vessels are then seen imbedded in a small amount of fatty tissue. The arteries are doubly clamped, cut, and ligated. No attempt

is made to approximate the intercostal muscles. The pectoralis fascia is approximated by several fine catgut sutures. The skin is closed with a continuous fine silk suture.

Rationale

The rationale for this procedure is best demonstrated by referring to the anatomic illustration in figure 1. The ligation of the internal

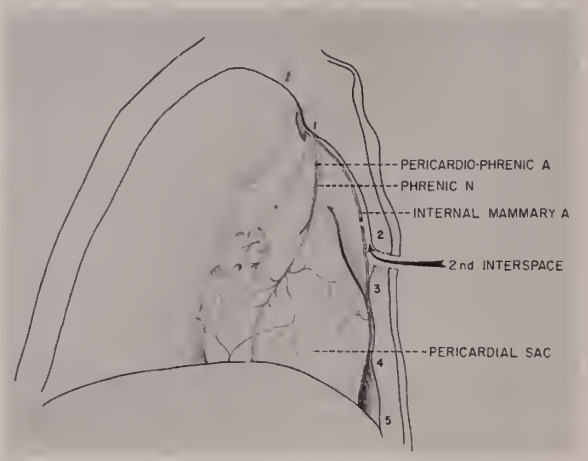

Fig. 1. Common origin of internal mammary artery and pericardio-phrenic artery.

mammary artery distal to the origin of the pericardiophrenic branch, diverts much of the flow to the latter vessel. As Glover points out,[3,4] almost the entire blood supply to the pericardium, which is anatomically continuous with the epicardium, is derived from the pericardiophrenic arteries, and the increased blood flow in this system may be presumed to find its way into the epicardial superficial plexus of vessels overlying the myocardium. Significant anastomoses between the pericardiophrenic vessels and the coronary system have been demonstrated by dye injection techniques.[2,3,5]

Glover's Observations

By October 18, 1957, Glover had performed this operation on 135 patients.[4] In evaluating his results, he divides his cases into three categories:

"The largest series have been those patients, mostly post coronary infarction, who are suffering from demonstrable angina pectoris. By demonstrable, I mean that they have an electrocardiographic pattern of coronary insufficiency.

"Another smaller group have been the somewhat older patients with generalized arteriosclerotic heart disease. The general deterioration has been one of myocardial insufficiency. They are prone to bouts of pulmonary edema, arrhythmias and the like. In some of these, it has not been possible to prove electrocardiographically that they had a specific coronary occlusion in the past, but their problem is predominately coronary insufficiency with a deteriorated myocardium as a result.

"The third group, and a much smaller one, has been again the somewhat older patient with aortic valvular disease, either stenosis or insufficiency or both, but in whom direct aortic valvular surgery is out of the question."

Group 3 he terms the hemodynamic group. Many of them suffer attacks of hemodynamic angina pectoris.

Of the entire series, 100 have been analyzed as follows:

"Eight out of the 9 of the hemodynamic cases (group 3) operated upon have been benefited; 9 out of the 12 of the so-called generalized arteriosclerotic group (group 2), but in whom hypertension seemed to play a part, likewise benefited. The remainder with the typical post infarction angina pectoris cases (group 1), 46 out of the 79 are improved. The overall figure is that 73 per cent of the first 100 have shown improvement from 3 to 9 months, which is the duration of follow up. Fifty of these 73 are very obviously improved. The other 23 are classified as slightly improved."

Experience of Rutledge

In a personal communication Rutledge[6] reports:

"We have done approximately 25 cases to date (October 21, 1957). The immediate results in the hospital are rather spectacular. Practically all of our patients have had complete relief of the anginal pain. They do have some soreness from the incision. However, this improvement has not always been maintained when they go home. I know of at least 3 patients who have had a recurrence of their pain when they have returned to the stress of their every-day living. One of our patients, a man with severe myxedema, has died since surgery. He did, however, have relief of the pain. Three of our patients have been physicians who I feel are in a pretty

good position to estimate the improvement. In general, they have felt that their improvement is about 80 per cent."

Our Own Experience

To the time of writing we have operated upon 20 patients, 13 of whom have had a follow-up of two to five months. In 12 of these the improvement may be described as marked in 6, moderate in 3, slight in 2, and none in 1. The thirteenth patient (case 5), a man of 63 years who showed marked sustained improvement, died unexpectedly in his sleep two months and five days after the operation. Reporting his death the wife writes: "His mental attitude improved a lot as he felt better and was without pain and able to do things he hadn't done for some time. His color improved also. He slept better nights, something he hadn't done for some time before the operation." No autopsy was obtained.

Of the remaining 7 patients who were followed for less than two months, 6 showed moderate to marked immediate improvement. The seventh patient (case 20), a man of 42 years, showed no improvement. He continued to have severe pain and died suddenly one week after the operation. Autopsy revealed two old and one fresh myocardial infarctions.

Electrocardiographic Observations

Glover reports improved electrocardiographic changes in 13 cases (26 per cent). In our series of 20 patients, improvement in electrocardiographic patterns was noted in 3 instances (cases 2, 9, and 11). The significance of such postoperative improvement is difficult to assess. Changes in T waves and ST segment displacement may occur spontaneously, independently of medication or surgical procedures. A much larger experience and longer period of observation will be needed to determine the effect of this operation upon the electrocardiogram.

Summary

Of 20 patients operated upon, 15 showed significant improvement and 3 slight improvement. Two patients have died: one on the eighth postoperative day, the other 66 days after operation. The former had shown no improvement. The latter died in his sleep after marked sustained improvement for more than two months. Overall improvement noted in 75 per cent of the cases corresponds closely to results reported by Glover and by Rutledge.

CASE REPORTS

Case 1. Female, age 46. Severe angina pectoris for one year; attacks on slight exertion. EKG: Evidence of myocardial damage, probably old subepicardial myocardial infarction. Operation July 24, 1957. Attacks subsided immediately. Last seen Nov. 8, 1957. Still free from pain. EKG: No significant change.

Case 2. Male, age 43. Upon returning to work after six days immobilization for a back injury, he developed typical, severe, frequent, anginal attacks which were relieved by nitroglycerine. EKG: Definite though mild changes suggestive of ischemia. Operation Aug. 18, 1957. Complete relief from anginal attacks. Work resumed after one week. Last seen Jan. 4, 1958. Has been continually employed and completely free of pain. EKG: Nov. 9, 1957 shows a disappearance of the ischemic pattern. This was the only case in which a definite reversal to normal of electrocardiographic changes was observed.

Case 3. Male, age 51. Typical angina for two years. EKG: Definite marked ischemic pattern. Operation Aug. 19, 1957. Marked immediate relief. Last seen Oct. 23, 1957. No angina. Went deer hunting without experiencing any distress. EKG: No significant change.

Case 4. Female, age 67. Acute posterior wall myocardial infarction in 1950. Episodes of chest pain and of congestive failure on many occasions since. Anterior wall infarction in 1957. Greatly incapacitated because of angina and congestive failure since. EKG: Evidence of multiple myocardial infarctions (posterior and anterior). Operation Aug. 20, 1957. Moderate relief of anginal episodes; congestive failure now easily controlled. Improvement regarded as slight to moderate. EKG: No significant change.

Case 5. Male, age 63. Hypertensive and coronary heart disease with typical anginal attacks since May 1956. Only partially relieved by medical therapy. In June 1957 developed dyspnea and progressive increase in the frequency and severity of anginal attacks. EKG: Partial left bundle branch block. Operation Aug. 26, 1957. Definite improvement. Dyspnea now readily controlled and anginal attacks largely subsided. While improving steadily, he unexpectedly died in his sleep on Oct. 31, 1957. EKG: No significant change.

Case 6. Male, age 49. Typical angina of effort for two years, partially controlled by medication. EKG: Within normal limits. Operation Aug. 26, 1957. Relief of pain immediate and persistent. Last seen Nov. 23, 1957. "Feels fine." No anginal attacks; has no need for nitroglycerine.

Case 7. Male, age 42. Acute anterior wall infarction in March 1956. Good recovery. When seen Aug. 28, 1957, complained of fatigue only; no pain. EKG: Old healed anterior wall infarction pattern. Operation Aug. 29, 1957. Returned to work in 48 hours. Last seen Oct. 16, 1957. Stated he definitely had more endurance. EKG: Unchanged.

Case 8. Male, age 69. Chronic hypertension (200/120); chronic angina pectoris, moderately well controlled with Rauwiloid and nitroglycerine. Operation Sept. 4, 1957. Marked improvement. Last seen Dec. 28, 1957. Able to walk and climb without pain. Much less fatigue. EKG: No change.

Case 9. Male, age 56. Angina pectoris for two years. Acute anterior wall myocardial infarction January 1956. EKG: Pattern of old healed anterior wall myocardial infarction. Operation Sept. 9, 1957. Slight to moderate improvement. Last seen Dec. 4, 1957. Attacks fewer and of lesser severity. EKG: Some return toward more normal pattern in left precordial leads. TV5, previously deeply inverted now flat, and TV6, previously flat to inverted, now upright; this lead now completely normal.

Case 10. Female, age 55. Typical anginal pains for six years. EKG: Left bundle branch block. Operation Sept. 17, 1957. Last seen Nov. 20, 1957. Slightly improved. Has to take same medication as before. EKG: No change.

Case 11. Male, age 52. Pressure pain in chest radiating to left arm for one year. EKG: Borderline changes, some sagging of ST segments in leads II, V5, V6. Operation Oct. 7, 1957. Last seen Dec. 13, 1957. States that pressure which had been almost constantly present before operation is no longer troubling him. Also dizziness from which he had suffered for a long time is now gone. EKG: Questionable changes toward a more normal pattern.

Case 12. Male, age 41. Posterior wall infarction in 1952. Anginal attacks off and on since. EKG: Evidence of the old posterior wall infarction. Operation Oct. 18, 1957. Last seen Dec. 16, 1957. Stated he felt definite improvement. EKG: No change.

Case 13. Male, age 45. Angina pectoris of one year's duration. EKG: Evidence of coronary insufficiency; probably old antero-septal myocardial infarction. Operation Oct. 29, 1957. Last seen Nov. 27, 1957. Stated he felt much improved; attacks fewer and less severe. EKG: No change.

Case 14. Male, age 47. Anginal attacks for four years. EKG: Within normal limits. Operation Nov. 6, 1957. Last seen Nov. 27, 1957. Subjectively improved.

Case 15. Male, age 43. Angina pectoris for three years. EKG: Antero-lateral wall ischemia. Operation Nov. 8, 1957. Last seen Dec. 16, 1957. Felt he was much better. No pain since operation. EKG: No change.

Case 16. Female, age 71. Under observation for 17 years. Hypertension and coronary heart disease with many episodes of congestive failure. More difficult to control in recent months. Operation Nov. 8, 1957. Last seen Dec. 9, 1957. Definitely improved. Was able to do things she had not been able to accomplish before the operation.

Case 17. Male, age 43. Coronary occlusion three years ago. Angina pectoris since. EKG: Old anterior wall myocardial infarction. Operation Nov. 19, 1957. Last seen Nov. 25, 1957, six days postoperative. Felt better, could walk without pain. EKG: No change.

Case 18. Male, age 66. Coronary occlusion seven years ago. Anginal attacks since. Pain and dyspnea on walking half block. Took 4 to 5 nitroglycerine daily. Symptoms worse the past month. Operation Nov. 18, 1957. Last seen Dec. 18, 1957. Felt better, tolerated more activity without pain.

Case 19. Female, age 72. Angina with exertion, progressively severe since 1940. EKG: Borderline changes. Operation Nov. 21, 1957. Last report Dec. 10, 1957. Felt much improved. Was taking 1 or 2 nitroglycerine per day against 6 to 12 nitroglycerine and several codeine tablets before the operation.

Case 20. Male, age 44. Severe angina after exertion and after eating since 1953. EKG: Taken Dec. 2, 1957 during pain showed antero-lateral myocardial ischemia. Blood cholesterol 456 mg. Operation Dec. 3, 1957. Severe angina persisted. Died suddenly one week after the operation. Autopsy revealed two old and one fresh myocardial infarctions.•

Pulmonary Resection in Recurrent Spontaneous Pneumothorax

G. H. Lawrence, M.D.
L. D. Hill, M.D.
AND
E. H. Morgan, M.D.
SEATTLE, WASHINGTON

While formerly considered an indication of more serious underlying pulmonary disease, spontaneous pneumothorax, as emphasized by Kjaergaard in 1932,[1] is more usually found in otherwise healthy young adults. The incidence of subsequent tuberculosis, for example, is no greater than that in the general population[2] and if present, is usually recognized at the time of collapse by fever, pleural fluid, and parenchymal changes in the lung.[3] Collapse in spontaneous pneumothorax has been variously described as occurring secondary to the air leak caused by a rupture of a subpleural bleb, emphysematous bulla, or a congenital cyst. Treatment of spontaneous pneumothorax has varied considerably to include simple bed rest, needle aspiration, thoracotomy tube drainage, and surgical exploration. Prevention of recurrent spontaneous pneumothorax, which has been estimated to occur in approximately one of every four patients who have experienced an initial collapse, has been attempted by inducing an obliterative irritative pleuritis or by excision of abnormal pulmonary tissue at thoracotomy. Contrary to common misconception the pathologic lesion in recurrent spontaneous pneumothorax is usually localized in a given segment or, at the most, two segments.

This report concerns an experience with the management of recurrent spontaneous pneumothorax by pulmonary resection. The cases represent a series from the Mason Clinic and those resected by one of us (G.H.L.) elsewhere.*

*Washington University Medical School, St. Louis, Missouri, and University of Michigan Medical School, Ann Arbor, Michigan.

Selection of Patients

Spontaneous pneumothorax usually presents as a sudden catastrophic event to the patient, marked by extreme thoracic pain and dyspnea. Physical examination reveals hyperresonance and absent or diminished breath sounds on the affected side. X-ray evidence of absent lung markings on the affected side may be confused occasionally with a large cyst or pneumatocoele, but can be differentiated by injection of warm lipiodol into the hemithorax through a No. 22 needle. This will demonstrate lung markings within a cyst itself, and their absence in pneumothorax.

As the pleural space is normally only a potential one, the basic consideration of therapy should be removal of air from the pleural space with resultant re-expansion of the underlying lung. When collapse of the lung is significant, that is when the collapse amounts to more than 30 per cent of the normal lung volume as visualized in the thoracic roentgenogram, a program of simple bed rest and spontaneous absorption of air without its definitive removal is often associated with chronicity and significant morbidity.[4] As the air leak from the lung is usually through a rent in the pleural surface associated with surrounding pleuritis and fibrosis, the defect tends to be held open by this scarred pleura and will heal only when sealed by adherence of the visceral to the parietal pleura. This seal, in truth, acts as a blow-out patch. Re-expansion of the lung provides the necessary pleural approximation and may be obtained either by needle aspiration of air or by thoracotomy tube drainage connected to a water seal bottle

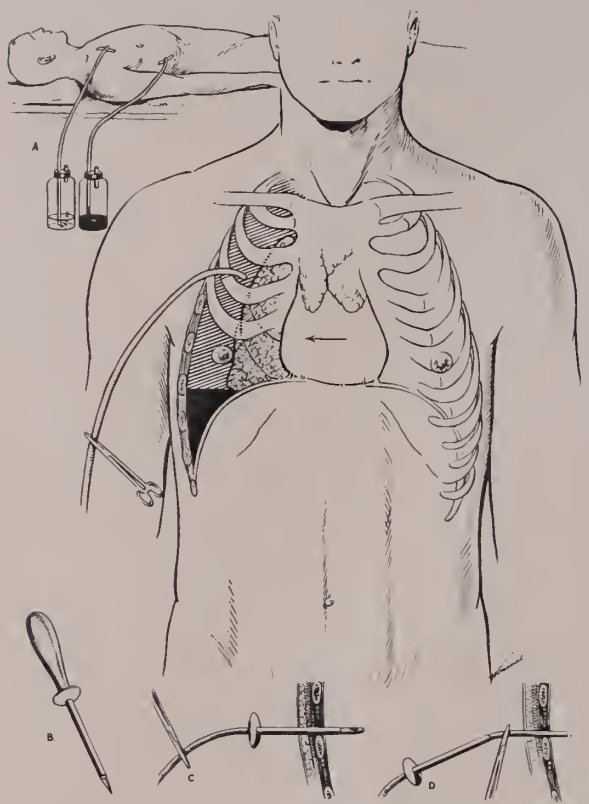

Fig. 1. Thoractomy tube drainage showing the anterior tube inserted for removal of air. Insert A illustrates the tube connected to water-seal drainage and an associated lateral tube used for removal of fluid or blood if present. Inserts B-D demonstrate the method of introducing the tubes by trochar under local anesthesia. The tube, clamped proximally, is inserted through the trochar in insert C. The trochar is then removed, clamping the tube, until connected to water-seal.

(Fig. 1). The latter provides an effective continuous means of re-expansion at a physiologically favorable negative pressure, avoiding thereby too rapid and brief re-expansion by needle aspiration. Either form of air removal may become emergent when mediastinal shift develops secondary to undue air accumulation and resultant tension in the pleural space, or where pre-existing pulmonary reserve is further impaired by collapse of the lung. Should the air leak be large or the patient have a diminished respiratory excursion, evacuation of air through thoracotomy tube drainage should be supplemented by suction at physiologic negative pressure in order to increase the volume of air removed. When suction is used, it is our opinion that an additional thoracotomy tube should be inserted for use with the suction apparatus. The reason for this point of view lies in a simple physiologic fact. Maximal expiratory flow rate in normal subjects can be as high as 400 L. a minute, as during a cough. Obviously a flow rate of such magnitude is of very brief duration. Nevertheless, if such a rate of flow were directed through a rent in the lung into the pleural space instead of through the trachea, removal of air from the pleural cavity would require a pump of far greater capacity than the usual suction apparatus affords. Therefore it is our belief that drainage of the pleural space should not be limited by a pump of relatively low capacity. The inherent safety of a simple blow-off tube under a water seal should always be maintained. A large air leak may require emergent thoracotomy should suction through thoracotomy tubes prove incapable of re-expanding the lung.

If re-expansion of the lung has been completed, the thoracotomy tube may be removed after pleural symphysis has sealed the air leak, usually in 12 hours after visible fluctuation in the chest bottle has ceased. The patient may return to gainful if not excessive activity within several days after his collapse.

Recurrent pneumothorax, should it develop, requires definitive measures to prevent its repetition. The production of an irritative pleuritis by means of silver nitrate,[5] autogenous blood,[6] mechanical irritation,[7] talc,[8] or other agents introduced into the pleural space either through a thoracoscope or at open thoracotomy, has proved effective, but is unfortunately associated with some untoward reactions,[9] particularly fever and intrapleural infection. Diffuse bullous disease not lending itself to resectional surgery would appear to be best suited to this form of prevention.

Thoracotomy and resection are, therefore, reserved for: (1) those patients suspected of having localized disease as the source of recurrent air leak and, (2) those patients who do not re-expand following thoracotomy tube drainage during their initial or recurrent collapse. Measurement of pleural pressures following removal of air differentiates between persistent air leak or fibrous encapsulation of the lung as the cause of this failure to re-expand.

Pathologic Findings

The lesions resected have been located in the apical or apical-posterior segments of the upper lobes in all cases in this series save in one case of congenital cystic disease limited to the right middle lobe (Fig. 2) and one case where cystic disease was located in the superior dorsal

Fig. 2. A large congenital cyst of the right middle lobe which has produced recurrent spontaneous pneumothorax in a 42 year old male. He has had no recurrence five years since right middle lobectomy.

segment of the lower lobe as well as the apical segment of the upper lobe. These lesions have been well localized and have not represented diffuse involvement of the lung. Classically such lesions are described as being subpleural blebs, bullous cysts, or congenital cysts. It was at first somewhat disappointing to receive pathologic diagnosis which did not follow this classification. However, the chronic pleuritis, fibrosis, and atelectasis usually described in resected tissue contributes significant information, for it is this scarring and fibrosis which tends to perpetuate the air leak (Figs. 3, 4). Once a leak has occurred from the cystic tissue through fibrotic pleura, collapse of the cyst and obliteration of the leak are prevented by the scarred wall which does not collapse. Decortication of the remaining non-cystic but captive lung to insure adequate re-expansion may prove necessary. The fibrous "peel" that forms on the pleura following prolonged collapse of the lung necessarily prevents re-expansion by less definitive forms of therapy than decortication.

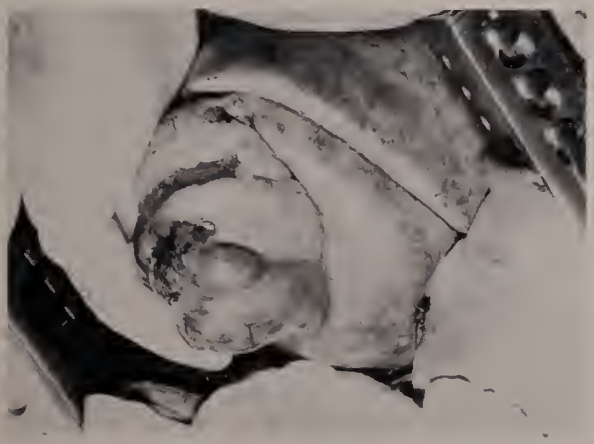

Fig. 3. Apex of the left upper lobe showing scarring and fibrosis over the apical subpleural blebs. This patient's x-rays are presented in figure 5.

Fig. 4. Apical resected segment right upper lobe showing solitary subpleural bleb with overlying fibrosis.

Clinical Considerations

Of the 14 cases in this series, 12 occurred in males. From one to as many as 45 previous episodes of collapse occurred in these cases (Fig. 5). Of these resections, segmentectomy was performed 12 times, lobectomy once, and wedge resection on three occasions. Three resections required concomitant decortication and two patients had staged, bilateral resection. Iodized or plain talc poudrage of the lung was combined with resection in five patients. The average hospital stay following operation was 9.6 days and the longest was 14 days. There was no mortality and no significant postoperative complications in the series. The patients were followed from one to four years after surgery.

To our knowledge, recurrent spontaneous pneumothorax occurred in but one of the 14 patients previously subjected to thoracotomy. It is our opinion that recurrence after definitive surgical therapy is extremely rare; hence, in the case of the patient so affected is presented.

CASE REPORT

A 35 year old housewife was first seen in 1952 with a small right spontaneous pneumothorax which re-ex-

Fig. 5. Left: 36 year old painter who had undergone resection of apical subpleural bleb on the left following 45 recurrences of spontaneous pneumothorax. This x-ray shows his tenth recurrence on the right. Right: Following resection of a similar lesion on the right side, he has been bilaterally free of recurrence for four years.

panded spontaneously. Six months later the collapse recurred and at thoractomy, cystic areas were resected from the apex of the right upper lobe and the superior dorsal segment of the right lower lobe. The pleural surfaces were dusted with 10 per cent iodized talc. Three and one-half years later she experienced severe thoracic pain and limited collapse of the right lower lobe. Forty-seven days later, complete spontaneous re-expansion of the lung was documented by x-ray. She has remained well since that time.

Discussion

Thoracotomy and resection of the source of air leak in chronic recurrent spontaneous pneumothorax has received increasing enthusiasm in recent years.[9-13] While simultaneous bilateral thoracotomy resection has been advocated,[14] we would agree with Tuttle that such an approach is over-aggressive and not indicated in face of the low incidence of bilateral collapse.[15] Likewise, concomitant pleurectomy is unnecessary and may be hazardous in fact of the unavoidable bleeding which ensues. Morbidity, mortality, and hospital stay actually have been less with surgery than in the allegedly more conservative forms of therapy. This report reinforces the concept of resection and demonstrates its effectiveness as a means of preventing recurrence. Tissue studies have demonstrated the fibrotic pleural scarring which perpetuates the air leak once it has occurred.

Summary

Resection of etiologic lesions in recurrent spontaneous pneumothorax provides a safe and practical method of preventing collapse of the lung. Experience in 14 cases substantiates the validity of this concept. One case of limited recurrence followed resection. •

1118 Ninth Avenue (1) (Dr. Lawrence).

Tularemia

M. A. Holmes, D.V.M.
AND
S. B. Osgood, M.D.
PORTLAND, OREGON

Heavy Microtus (field mouse) infestation in five Oregon counties and a pronounced cyclic peak in the majority of other counties has caused considerable concern over possible hazards to human health.

Epidemiologic and ecologic investigations in the United States and in Europe during similar infestations have revealed that epizootics nearly always follow such population increases. Subsequent human illness frequently reaches epidemic proportions.

Preliminary investigations by staff members of the Oregon State Board of Health and the United States Public Health Service have shown that 34 per cent of mice trapped alive in Klamath County died later of tularemia. In five areas where concentrated surveys were made, tularemia deaths in mice varied from 22 to 34 per cent. Water samples taken from streams and shallow surface wells have also yielded tularemia organism. Additional laboratory examinations have revealed two isolations of bubonic plague and a yet unidentifiable virus.

It is difficult to evaluate the potential public health hazards that may be involved; therefore it is necessary to rely upon documented reports of what has occurred in previous outbreaks.

Two tularemia epidemics in man, each involving 200 cases, have been described from Australia following outbreaks in field mice.[1] Numerous reports from USSR describe types of human tularemia from murine sources: 1) Occupational bubonic forms in early spring; 2) massive outbreaks of anginal type from water-borne tularemia; and 3) typhoidal, pneumonic, and influenzal types from inhalation during threshing and cultivation of fields where mice died, as well as from mouse feces in dust and grain.[2]

In the United States, tularemia epizootics among beaver and muskrat have infected streams in Montana, Idaho, and Wyoming, contaminating areas of a single river up to 35 miles and for 16 months duration.[3,4]

Experimental studies as to the vialibity of the organism outside the animal body have shown that it can survive for long periods of time in mud, rodent urine, animal tissues, rodent hair, and grain, especially under low temperatures. This indicates that the organism can survive the winter months, and serve to infect both animals and man after thawing in the spring.[5-7] With various ecto-parasites serving as vectors in transmitting the disease, the public health potential is increased.

The Merck Manual identifies the disease as "an acute infectious disease, often bizarre in its manifestations, but usually characterized by a primary local ulcerative lesion, profound systemic symptoms, a typhoid-like state, bacteremia, and not infrequently atypical pneumonia."[8]

Infection is incurred most frequently through handling animals suffering from tularemia. The organism is thought to be capable of penetrating unbroken skin but it may enter the body through the conjunctivae, as a result of insect bites, after eating inadequately cooked meat or as a result of drinking contaminated water. There has been no report of man-to-man transmission.

Superficial lesions occur in approximately 10 per cent of the cases and may be noticed on the fingers, eyes, or mouth. They appear as focal areas of necrosis one to ten days after contact. This is accompanied by sudden headaches, chills, nausea, vomiting, and temperatures of 103 to 104 F. The external lesion first appears as a papule and becomes pustular later. This ulcerates and is followed by enlarged regional lymph

nodes which suppurate and drain. Lymphadenitis occurs in more than 90 per cent of the cases. The spleen, liver, lungs, lymph nodes, bone marrow, and possibly other tissues will have scattered necrotic foci as the result of transitory bacteremia. Secondary invasion occurs with bacteria being dispersed throughout the systemic and pulmonary circulation, forming miliary and submiliary foci of necrosis. Bacteremia disappears after formation of antibodies. The pneumonic form closely resembles tuberculosis and is characterized by lobular bronchopneumonia with necrotizing infiltration of the parenchyma. Gangrene, cavitation, and abcess formation may follow.

Immunity develops after an attack of tularemia. Induced immunity, by use of a phenolized or acetone extracted vaccine, modifies clinical symptoms, or provides a useful degree of protection according to Foshay and his group.

Diagnosis of tularemia may be made by recovery of the organism from the ulcer, the enlarged lymph nodes, or from the blood. Agglutination tests may become positive after the tenth day of illness and usually never before the eighth day. Blood samples for the agglutination (Widal) test should consist of two or more paired 5 to 8 cc. samples of whole blood collected two to four weeks apart. The first specimen should be collected as soon as the disease is suspected and subsequent specimens at intervals of two to four weeks in order to demonstrate a diagnostic rise in agglutination titer. History of contact, with ill rodents, plus sudden onset of typical ulcerative lesions, are significant in making a diagnosis.

Treatment is best accomplished by the use of 0.5 Gm. streptomycin or dihydrostreptomycin intramuscularly every 12 hours for 72 hours until the temperature becomes normal; thereafter 0.5 daily for 5 days. Administration of streptomycin or dihydrostreptomycin is followed by relapses much less frequently than when other antibiotics, such as the tetracyclines, are used.•

CONFIRMED THERAPEUTIC UTILITY

Pro-Banthine® "proved almost invariably effective in the relief of ulcer pain,

*in depressing gastric secretory volume and in inhibiting gastrointestinal motility."**

"Our findings were documented by an intensive and personal observation of these patients over a 2-year period in private practice, and in two large hospital clinics with close supervision and satisfactory follow-up studies."*

Among the many clinical indications for Pro-Banthine (brand of propantheline bromide), peptic ulcer is primary. During treatment, Pro-Banthine has been shown repeatedly to be a most valuable agent when used in conjunction with diet, antacids and essential psychotherapy.

Therapeutic utility and effectiveness of Pro-Banthine in the treatment of peptic ulcer are repeatedly referred to in the recent medical literature.

Pro-Banthine Dosage

The average adult oral dosage of Pro-Banthine is one tablet (15 mg.) with meals and two tablets at bedtime.

SEARLE

like the orchid,

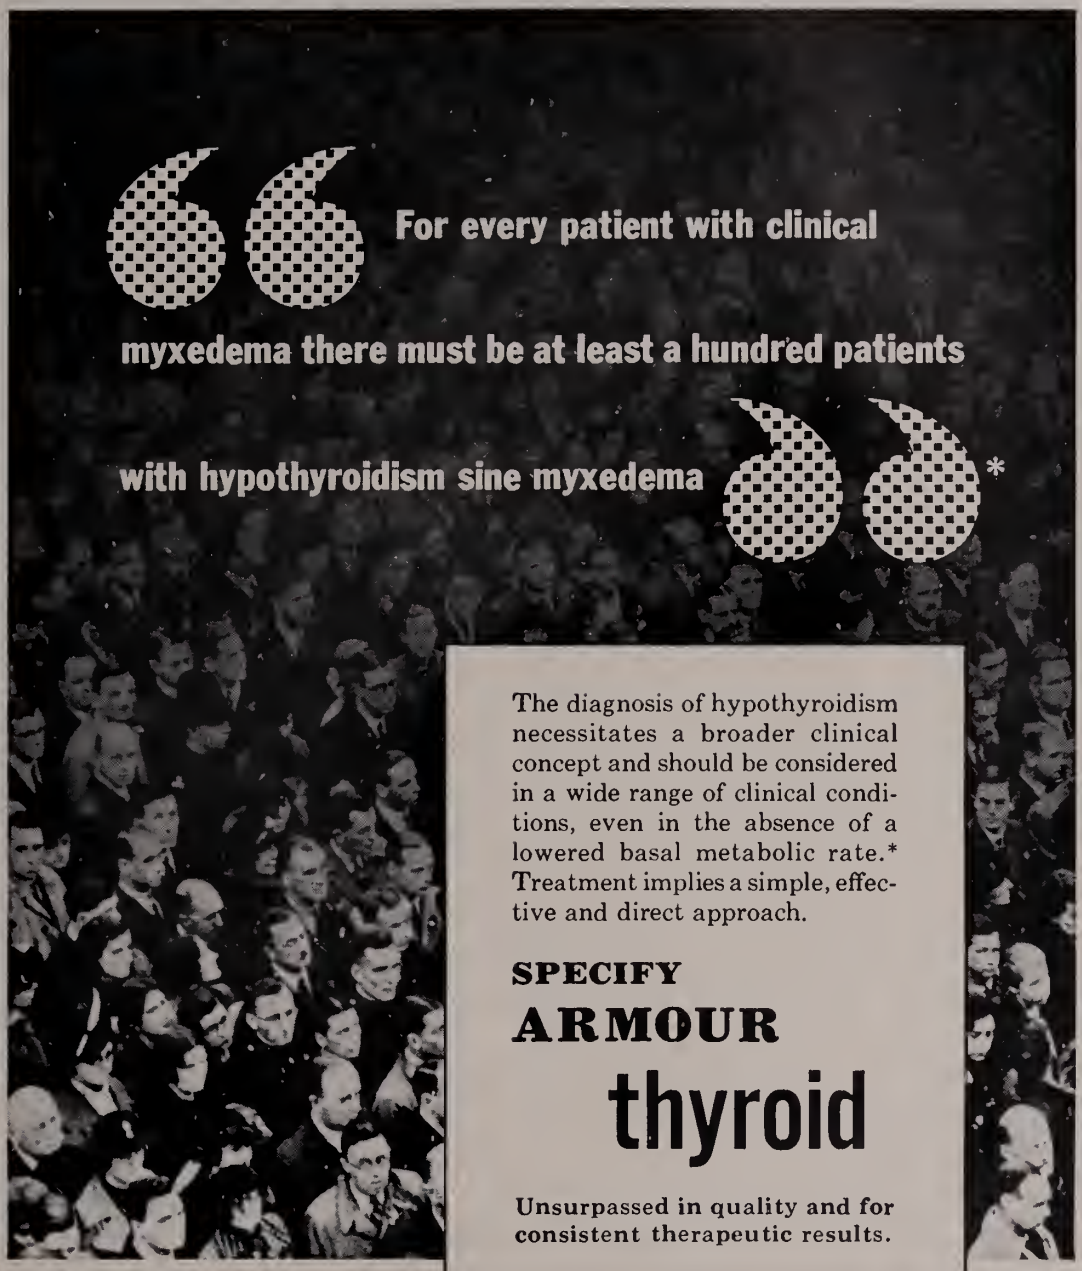
L. A. FORMULA

is still unsurpassed

L. A. FORMULA *normalizes* bowel function. It is equally effective in correcting simple constipation and non-specific diarrhea. It is ideal, therefore, in the Irritable Colon cases in which both constipation *and* diarrhea may occur.

L. A. FORMULA is a vegetable concentrate of naturally occurring hemicelluloses. It is derived from blond psyllium seed by our special Ultra-Pulverization Process and simultaneously dispersed in lactose and dextrose. It provides just the moist, smooth, effective bulk so essential to normal peristalsis.

L. A. FORMULA is not to be confused with the ordinary laxatives, neuromuscular stimulants, or mucosal irritants. They *exaggerate* peristaltic activity. L. A. FORMULA *normalizes* it.



L. A. FORMULA, furthermore, is undetectable in fruit juice or milk, pleasant tasting in water, and available in 7 and 14 ounce prescription containers at significantly lower cost-to-patient prices.

Baker's

MODIFIED MILK

A complete formula in liquid and powder form prepared exclusively from Grade A Milk

Doctor, your dietary decision can build *Blue Ribbon* babies. The baby who wins the blue ribbon is the one whose doctor—no one else—selects its formula.

BAKER'S MODIFIED MILK BUILDS BLUE RIBBON BABIES

- A complete, balanced uniform formula.
- Convenient and easy to prepare—simply add water.
- Made from milk of outstanding purity.
- Provides adequate amounts of all known essential vitamins plus much-needed iron.
- Butterfat replaced by easily digested vegetable oils.
- Twice homogenized for better digestion and absorption.
- Helps doctor control infant's formula longer. Advertised to the medical profession only.
- Economical to use—eliminates need for additional vitamins and iron.

SANBORN VISETTE

electrocardiograph

Everything you need for taking an accurate, permanent, directly-recorded electrocardiogram is now available in a "package" the size of a portable typewriter, and that weighs only 18 pounds! *This* is the new Model 300 VISETTE — a completely modern, transistorized ECG recently introduced by Sanborn Company. The unique design has made possible for the first time a clinically *accurate* instrument that is *truly* compact and fully portable.

By actual use — in your own examining room, in your patient's home, at a hospital — you can discover the Visette's value and portability. Convenience of *use*, greater ease of *operation* — and even simpler, faster *servicing*, should the need arise — comprise the design concept of this new Sanborn instrument.

A comprehensive folder describing the Model 300 VISETTE electrocardiograph is available on request. Or call the Sanborn Company Branch Office or Service Agency in your locality for a demonstration in your office — to see for yourself the advantages of owning the ECG that "brings 'cardiography to your patient."

The estoblished Sonborn Model 51 Viso-Cardiette is olso avoilable for those who prefer o larger, heavier (34 lbs.) instrument — $785.00, delivered. Many doctors use their "51 Viso" in the office and the Visette on "cordiagroph colls."

WHEN YOU TREAT INFECTIONS IN PATIENTS SUCH AS THESE

- debilitated
- elderly
- diabetics
- infants, especially prematures
- those on corticoids
- those who developed moniliasis on previous broad-spectrum therapy
- those on prolonged and/or high antibiotic dosage
- women—especially if pregnant or diabetic

the best broad-spectrum antibiotic to use is

MYSTECLIN-V

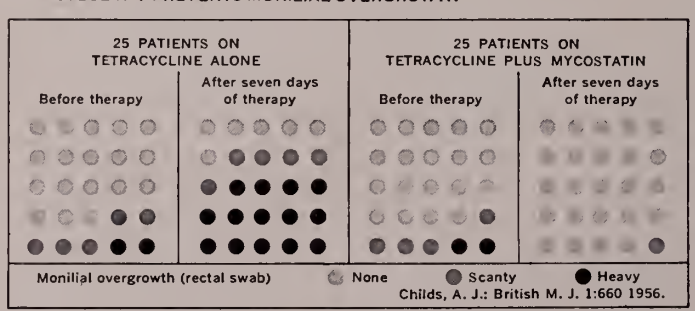
Squibb Tetracycline Phosphate Complex (Sumycin) and Nystatin (Mycostatin) — Sumycin plus Mycostatin

for practical purposes, Mysteclin-V is sodium-free

for "built-in" safety, Mysteclin-V combines:

1. Tetracycline phosphate complex (Sumycin) for superior initial tetracycline blood levels, assuring fast transport of adequate tetracycline to the infection site.

2. Mycostatin—the first safe antifungal antibiotic—for its specific antimonilial activity. Mycostatin protects many patients (see above) who are particularly prone to monilial complications when on broad-spectrum therapy.



Capsules (250 mg./250,000 u.), bottles of 16 and 100. *Half-Strength Capsules* (125 mg./125,000 u.), bottles of 16 and 100. *Suspension* (125 mg./125,000 u.), 2 oz. bottles. *Pediatric Drops* (100 mg./100,000 u.), 10 cc. dropper bottles.

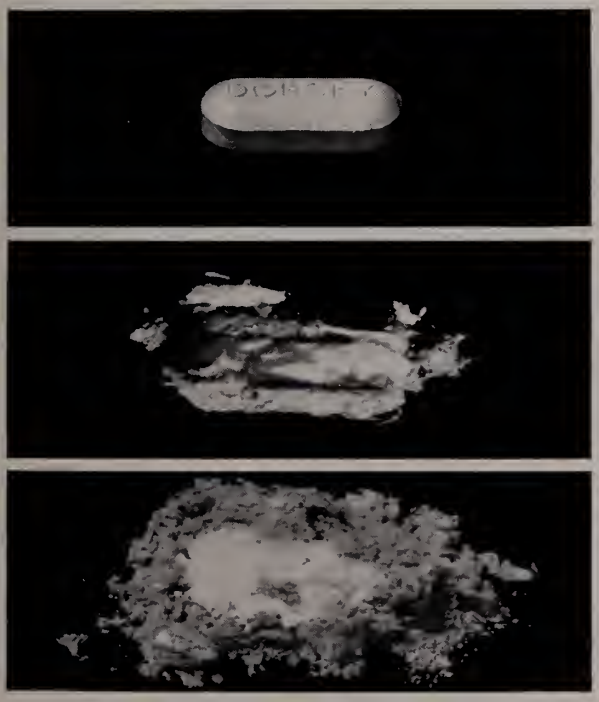
Consistent Gains in Functional Capacity Can Be Achieved with Conservative Therapy

The unemployable arthritic once again may undertake full employment and normal recreation. Patients once confined to the home or wheel chair often find it possible to engage in light work. And even bedridden patients can walk with comfort again. These are the benefits of conservative therapy as demonstrated in long-term studies.[1,2,3] In fact, in these four-year comparative studies of salicylate and cortisone, the corticoid showed no superiority over conservative therapy.

Superior Conservative Therapy Provided by Buffered Pabirin

Buffered Pabirin epitomizes modern, conservative therapy without the serious complications of corticoid therapy. Adrenal atrophy, peptic ulcers, moon-face, hypertension or psychotic reactions, a constant risk whenever corticoids are used,[4-7] will not occur with Buffered Pabirin. Month after month, Buffered Pabirin can be administered with a minimum of problems to patient and physician, and without the side effects common to the use of salicylates alone.



Buffered Pabirin combines new form and formulation for faster pain relief, improved gastric tolerance

Each tablet of Buffered Pabirin consists of an outer layer containing a buffer (aluminum hydroxide), para-aminobenzoic acid and ascorbic acid; an inner core of aspirin. The outer layer quickly releases aluminum hydroxide which affords superior buffering action and protects against gastric irritation. The core of Buffered Pabirin then disintegrates rapidly, permitting fast absorption of acetylsalicylic acid. PABA potentiates the acetylsalicylic acid and creates high salicylate blood levels. Ascorbic acid counteracts vitamin C depletion.

The new form and formulation of Buffered Pabirin provides high and sustained salicylate blood levels. It may be administered over long periods of time without the nausea, dyspepsia or other gastrointestinal symptoms so frequently experienced with salicylates alone.

in osteoarthritis, gouty arthritis, rheumatoid arthritis, bursitis, fibrositis, or tendinitis

BURROUGHS WELLCOME & CO. (U.S.A.) INC., Tuckahoe, New York

AN EVER-WIDENING CIRCLE OF THERAPEUTIC INFLUENCE

A versatile, dependable diuretic—the most widely prescribed of its kind: its unique action as a carbonic anhydrase inhibitor has proved strikingly effective not only in conditions requiring diuretic treatment but in the management of other conditions as well.

DIAMOX is well-suited to long-term therapy. Low toxicity, freedom from renal and gastrointestinal irritation, ease of administration make its use simple and singularly free of complications. Excretion of the drug by the kidney is complete within 24 hours, with no cumulative effects.[1]

Diuretic treatment with DIAMOX results in continuous rather than intermittent control of edema since DIAMOX is effective in the mobilization of edema fluid and in the prevention of fluid accumulation.[1] A single oral dose, active for 6-12 hours, provides the basis for the highly desirable advantage of daytime diuresis and nighttime rest.

Supplied: Scored Tablets of 250 mg.; Syrup containing 250 mg. per 5 cc. teaspoonful; Vials of 500 mg. for parenteral use.

Portland 5, Oregon

ANNUAL MEETING
September 3-5, 1958
Portland

President, Vern W. Miller, M.D., Salem
Secretary-Treasurer, Max H. Parrott, M.D., Portland
Executive Secretary, Mr. Rascae Miller, Portland

UOMS Alum Meeting April 16-18 To Feature Sommer Memorial Lectures

Physicians from throughout the West who graduated from the University of Oregon Medical School will return to the campus April 16-18 to participate in the 43rd annual meeting of the Alumni Association.

FRANK R. MENNE, M.D.

The three-day meeting will again feature the popular Sommer Memorial Lecture Series, many other scientific papers and a number of class reunions. Scientific programs will be held in the school auditorium.

Morton J. Goodman, President of the Association, has named F. A. Short, vice-president, as program chairman. Dr. Short is arranging the scientific sessions in cooperation with Frank R. Menne, chairman of the Sommer Memorial Lecture Committee.

Appearing as Sommer Lecturers are Lowell A. Rantz, professor of medicine at Stanford University; Mr. John Stallworthy of Oxford, England, and Allen Moritz, professor of pathology at Western Reserve.

The Oregon Academy of General Practice will provide Category No. 1 postgraduate credit for the meeting based on the number of hours of formal lectures.

Karl H. Martzoff Lectures in Chicago

The Chicago Medical Society has given recognition to one of Oregon's well-known surgeons. It invited Karl H. Martzloff of Portland to be a guest lecturer at its 1958 annual clinical conference held March 4, 5, 6 and 7, 1958, in Chicago.

Title of Dr. Martzloff's lecture was Early Recognition of Cervical Cancer in which he gave an evaluation of available techniques.

This is the second time in recent years that Dr. Martzloff has appeared as a guest lecturer in Chicago. In 1951 he gave the Charles Sumner Bacon Lecture for 1951-1952 at the University of Illinois School of Medicine. The title of Dr. Martzloff's lecture on that occasion was Analysis of Factors Influencing the Use of Surgery in Cancer of the Cervix Uteri.

Three Statewide Meetings Scheduled For April 19 in Portland

Officers of Oregon State Medical Society took advantage of an open date on Saturday, April 19, after the Council voted to dispense with the 1958 Mid-Year Meeting of the House of Delegates, to schedule three important statewide meetings for that day.

The all-day series of meetings will commence in the morning when the Third New Member Institute convenes in the Florentine Room at the Columbia Athletic Club in Portland. Attendance at a New Member Institute is now required in the Society's By-Laws of all new members during the first three years of practice in Oregon.

The afternoon will be devoted to the Third Annual Component Society Officers Conference combined with a meeting of the "Key Men" appointed by the President to assist the Committee on Public Policy in matters relating to legislation.

In the evening, the Council will hold its regular monthly meeting. All visiting county officers and new members are invited to attend.

The New Member Institute is under direction of the Committee on Public Relations with Lee Thompson of Beaverton serving as chairman. According to Dr. Thompson the spring session of the Institute will emphasize the practical aspects of medical practice along with a review of the principles and objectives of medical organization.

The Mid-Year Meeting, held regularly during recent years, is a special session of the House and is called at the discretion of the Council. A majority of the Council agreed that the meeting should not be scheduled this year in view of a rather light business agenda and the fact that the 1958 Annual Session has been advanced more than one full month to the first week in September.

The Officers Conference was inaugurated in 1956 when E. G. Chuinard served as president. The first session was held in Portland. In 1957 the Lane County Medical Society was host at a very successful all-day conference in Eugene. Business meetings were held in the conference room at Sacred Heart Hospital. In the evening, visiting officers and their wives enjoyed dinner and dancing at the Eugene Country Club.

The Officers Conference is designed to provide presidents and secretaries of component societies and all interested members with an up-to-the-minute report of Society affairs.

Council Supports Physician Case-Cost Index Program

For several years, local supervisory committees of Oregon Physicians' Service have scrutinized the cost of medical care rendered to OPS subscribers at the community level.

Information is supplied to the supervisory committees, physicians elected or appointed by the component medical society, through a complex tabulating system at OPS headquarters which is popularly known as the "physician cost index."

Physicians whose case-cost averages are at least 25 per cent above other practitioners in their type of practice in the community are reported to the supervisory committee. Those physicians are urged to cooperate with the supervisory committee during a six month period by keeping close account of their case costs.

In a few instances, supervisory committees have imposed penalties against physicians who repeatedly appeared on the case-cost studies.

At its March meeting, the Council of the Oregon State Medical Society took a firm stand in support of the physician case-cost index program. The Council agreed that medical societies have a responsibility for policing their own members in-so-far as the costs of medical care are concerned. This action resulted from a resolution presented by the Multnomah County Medical Society in January which asked the State Society to conduct a full investigation of the case-cost averaging system as applied by OPS with particular attention as to whether the system leads to the best medical care. The resolution was referred to the Society's Committee on Patient-Physician Relations of which Edward H. McLean of Oregon City is chairman.

The following report of that Committee was approved by the Council on March 1:

> Your Committee was asked to consider the following resolution submitted to the Council by the Multnomah County Medical Society and referred to this Committee by action of the Council at its meeting in January, 1958:
>
> > That the Oregon State Medical Society establish a special committee with instructions to conduct a full investigation of the "case-cost averaging system" now applied by Oregon Physicians' Service with particular consideration as to whether the system of preparing case-cost averages leads to the best medical care and report its findings and recommendations to the Council of the Oregon State Medical Society.

The Committee convened twice to consider this matter. At the first meeting on Saturday, February 1, 1958, the Committee heard a detailed report from Mr. Thorne H. Hammond, Assistant General Manager of Oregon Physicians' Service, regarding the history, purpose and actual operations of the Physicians' Index and Case-Cost Averaging System.

The second meeting of the Committee, held on Saturday, March 1, 1958, was devoted to further discussion of the material presented at the first meeting and a final analysis of Committee opinion as follows:

The Committee on Patient-Physician Relations is of the opinion that medical societies have a responsibility for policing their members in-so-far as the costs of medical care are concerned.

It is our opinion that the Physicians' Cost Index is a satisfactory method to accomplish this purpose in respect to the members of Oregon Physicians' Service.

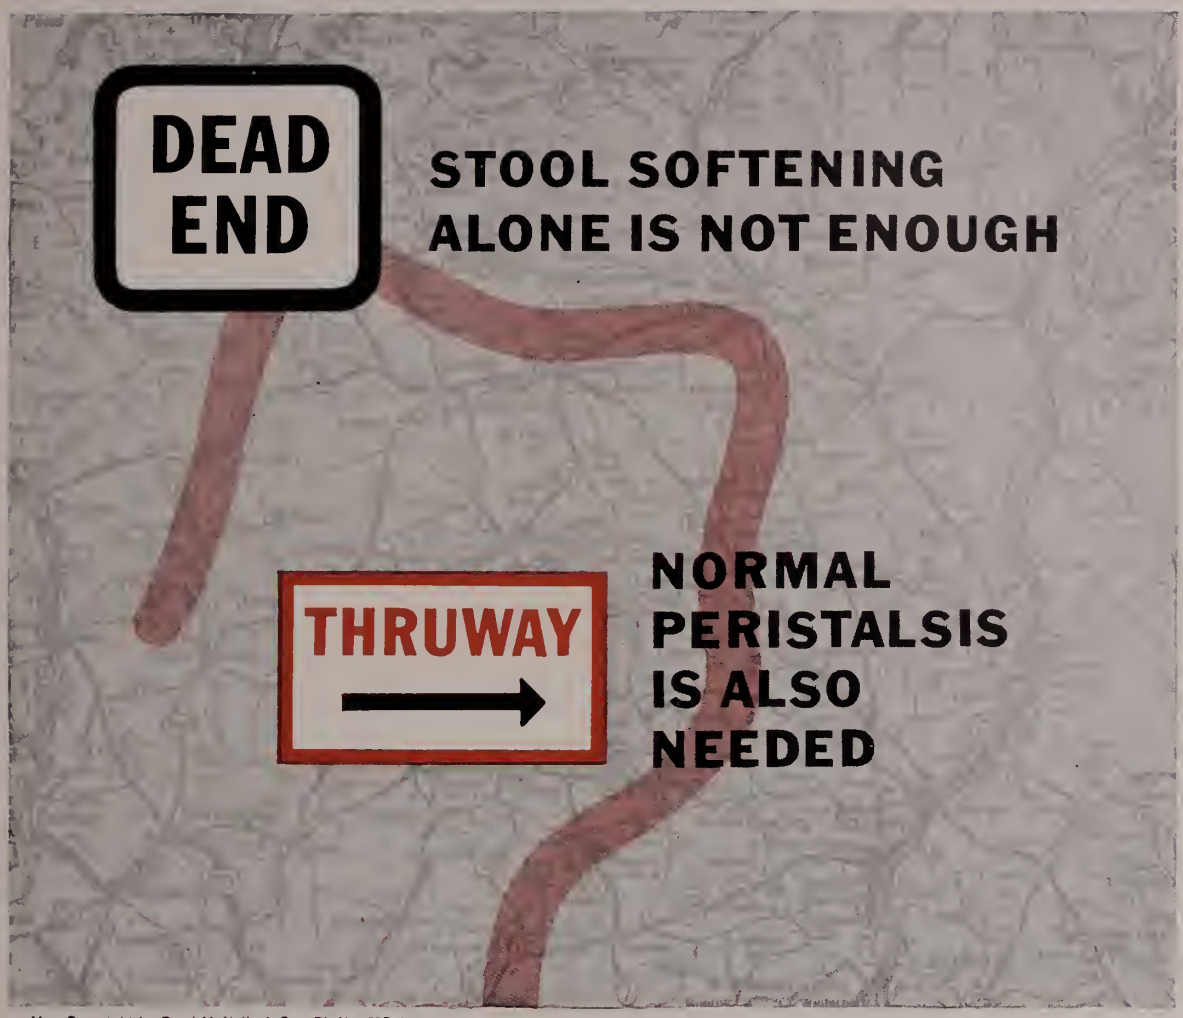
We further believe that the Index has been properly placed in the hands of the profession to be utilized by the seventeen local supervisory committees appointed by component societies of the Oregon State Medical Society.

After two lengthy meetings and extensive study we conclude that the Physicians' Cost Index is not detrimental to the best type of medical practice and, as a matter of fact, has proved beneficial to the quality of medical care in many instances. Furthermore, we do not feel that the Index system is unfair to the individual practitioner.

Respectfully submitted,
COMMITTEE ON PATIENT-PHYSICIAN RELATIONS
Edward H. McLean, M.D., Chairman
Ralph Thompson, M.D.
J. P. Brennan, M.D.
Matthew McKirdie, M.D.
Robert W. Patton, M.D.
Edward A. Lebold, M.D.

Ivan M. Woolley Elected Vice-President of American College of Radiology

At its 1958 annual meeting and convocation held in Chicago, February 7, 1958, the American College of Radiology elected Ivan M. Woolley of Portland vice-president for the coming year. This is the first time such an honor has been bestowed upon a radiologist in the Pacific Northwest. Previously, Dr. Woolley had served as the College's Oregon Councilor.



In addition to his responsibilities with the College, Dr. Woolley has been active in the affairs of his specialty in the Northwest for many years. He is a charter member and was the first president of the Oregon Radiological Society and likewise a founding member of the Northwest Radiological Society of which he was the second president. He has also held the offices of vice-president and state counsellor of the Radiological Society of North America.

Active in medical affairs from the start of his professional career, Dr. Woolley was secretary of the Multnomah County Medical Society in 1932 and 1933 and served as its vice-president in 1952 and as president in 1954. He has also served on many important committees of Multnomah County Medical Society and Oregon State Medical Society.

Dr. Woolley is a past-president of the Medical Staff of the Emmanuel Hospital and of the Alumni Association of the University of Oregon Medical School.

State Academy of GP Meeting Date Change

Oregon Academy of General Practice has changed the meeting plate and date for its 1958 Annual Session to the following: Columbia Athletic Club, Portland, Oregon, October 16 and 17.

Aquatyl®

a natural peristaltic stimulator with effective stool softening action

restores normal bowel physiology to provide normal, lasting correction of constipation. Each Aquatyl tabule contains 50 mg. dioctyl sodium sulfosuccinate and 100 mg. cholic acid. Dioctyl sodium sulfosuccinate safely softens the stool . . . cholic acid, an elemental body constituent, sparks natural peristalsis and a return to normal evacuation.

Dosage: Initially, two or three tabules with a full glass of water 3 times daily for three days. Maintenance therapy, usually 1 or 2 tabules daily.

INFERTILITY . . . *an age old problem*

DEFLOWERING by PRIAPUS
Within a certain ancient tribe, a fruitful union was believed to be fostered when the final act of the wedding was performed at the statue of Priapus where the bride had her hymen ruptured upon the stone phallus. This solemn rite was witnessed by the groom, attendants and guests.

HEP-FORTE offers a modern-day approach

Each capsule contains:

Desiccated Liver, Undefatted NF	194.4 mg.
Liver Concentrate NF	64.8 mg.
Liver Fraction No. 2, NF	64.8 mg.
Vitamin A Palmitate	1,667 USP Units
Menadione USP	0.134 mg.
Thiamine Mononitrate	1 mg.
Riboflavin	1 mg.
Pyridoxine Hydrochloride	0.67 mg
Ascorbic Acid	6.67 mg.
Niacinamide	10 mg.
d-Panthenol	1.33 mg.
Folic Acid USP	0.1 mg.
A fermentation extract equivalent in microbiological potency to vitamin B-12	0.33 mcg.
Biotin	3.3 mcg.
Inositol	10.0 mg.
dl-Methionine	10.0 mg.
Choline Bitartrate	21.0 mg.
Yeast Extract, Type No. 3 (Standard Brands)	64.8 mg.
Mixed Tocopherols (Equivalent to 1:53 I. U. Vitamin E)	3.34 mg.

Recent investigation in the field of functional infertility points the way to a more physiologic method of treatment. HEP-FORTE enhances the ability of the liver to detoxify and inactivate metabolic waste, thereby rendering the end organs more receptive to endogenous and/or exogenous hormonal stimulation.

Funds Contributed for Distributing Health Careers Guide Books to Students

A program to provide Oregon high schools with classroom supplies of an excellent Health Careers Guidebook cleared two major financial hurdles early in March when the Oregon State Medical Society and the Multnomah County Medical Society contributed a total of $300 to the project goal of $1,500. Other funds already had been received from the Woman's Auxiliary.

The Health Careers Guidebook for Oregon represents the results of an 18-month survey of a long list of health careers which was conducted through the Health Careers Horizons Project of the Portland Community Council. One of the chief researchers was Georgia Lee (Mrs. J. Robert Lee), a representative of the Woman's Auxiliary.

Although guidebooks for students interested in following health careers have been published and distributed to high schools nationally, sponsors believe this is the first attempt to compile pertinent facts about health careers in a single state. The booklet will include such information as educational requirements, job placement opportunities for each classification and chances for advancement in any particular health field in Oregon.

When published, a limited number of the booklets will be sent to secondary schools for classroom use to supplement the national guidebook which is available in each school library.

Health Careers volunteers are currently cooperating with University of Oregon Medical School and Multnomah County Medical Society in the promotion of a Health Careers Day at the school on April 10. Interested students will be invited to visit the campus where they will be taken on conducted tours for a personal view of medical careers in action.

Tours are planned for students interested in medicine, dentistry, medical psychology, hospital administration, technology, social work, x-ray, hygiene, occupational therapy, dietetics, medical photography and many other fields.

State Medical Civil Defense Chairmen To Meet in Portland September 2

John M. Hoffman, McMinnville, chairman of the Oregon State Medical Society's Committee on Emergency Medical Service, revealed plans at the March 1 meeting of the Council for a statewide conference of medical civil defense chairmen to be held in Portland on Tuesday, September 2.

Dr. Hoffman, reporting on a meeting with state civil defense officials, said plans are under way to keynote the conference with the appearance of a nationally prominent authority on medical disaster.

The president of each component medical society will be invited to designate a medical disaster chairman for each county within the Society's jurisdiction. Disaster chairmen will be requested to participate in the conference on the evening before the first day of the 1958 Annual Session.

Dr. Hoffman, who was authorized to attend the forthcoming national civil defense conference, recommended that new efforts be made to encourage all physicians to obtain a civil defense identification card. He suggested that photos and fingerprints for the cards could be secured at medical society meetings.

The Chairman further reported that 200-bed emergency hospitals have now been located in McMinnville, Salem, Molalla and Corvallis. At least seven additional field hospitals will be purchased for location in St. Helens, Camp White, Hood River, Ashland, Eugene, Salem and Medford.

Not all disaster planning is confined to problems with equipment and medical supplies. Quoting a letter from Donald Bauer in Coos Bay, Chairman Hoffman related that thousands of curious citizens jammed a state highway in that area recently for a better view of an Army dredge that had sunk in the harbor.

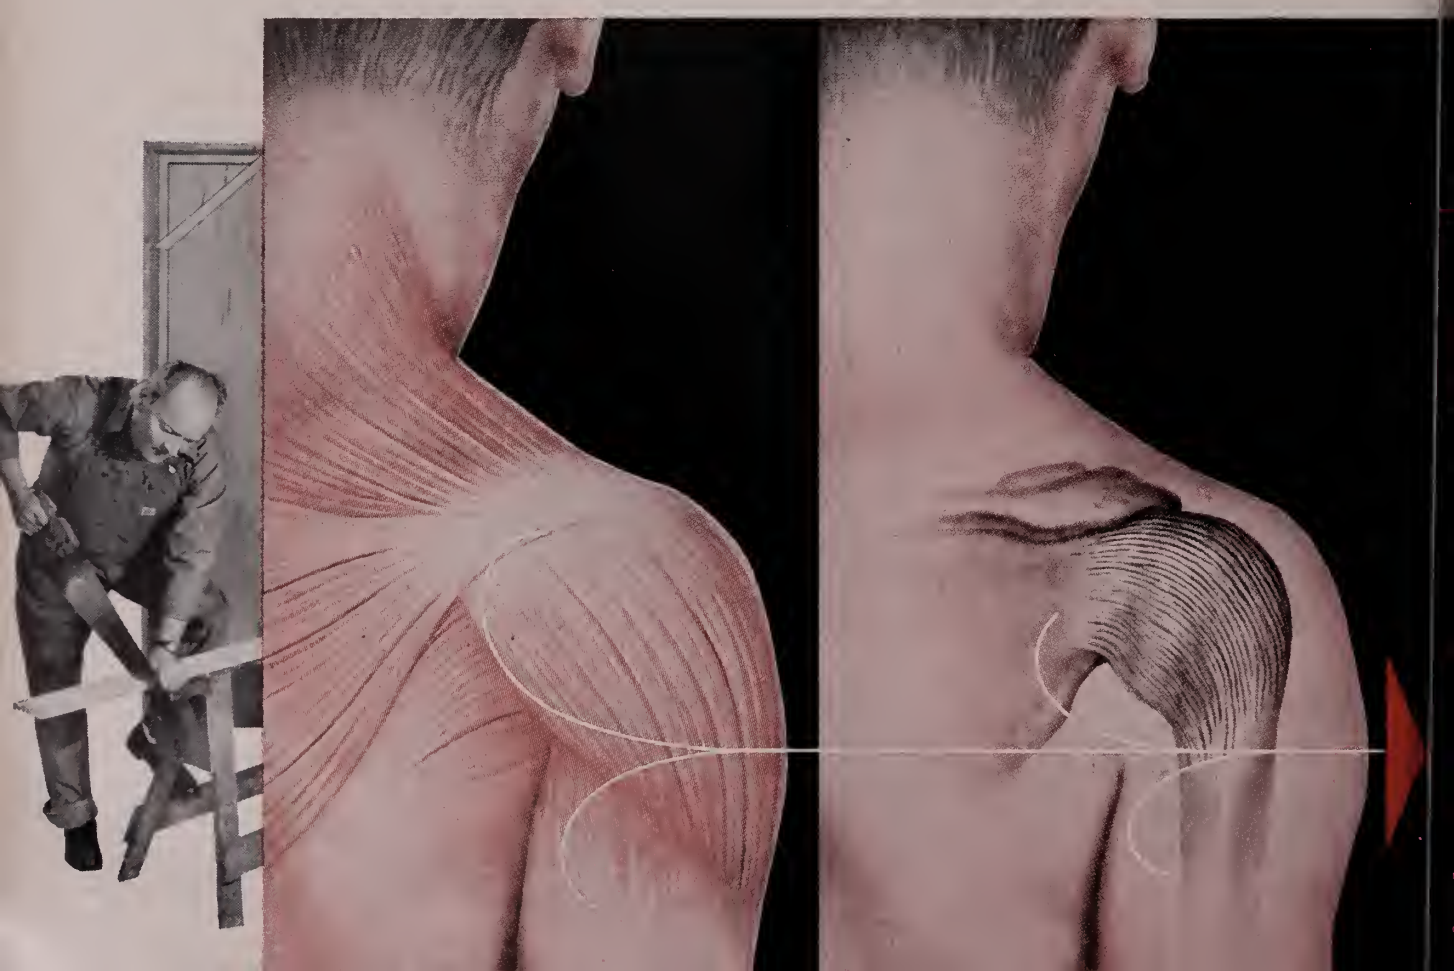
State police declared they were prohibited by state law from stopping or diverting traffic on the state highway even though the transportation situation was critical. Fortunately, in the Coos Bay incident, injured seamen were transported to the hospital minutes before the highway was snarled with automobiles.

The Council referred the highway question to the Committee on Public Policy.

Salem Surgical Society Meets

Scientific papers on Some Present Concepts in Hand Surgery and Tumors of the Neck were presented at a recent meeting of the Salem Surgical Society at Salem General Hospital.

Speakers were R. P. Embick, who talked on hand surgery, and D. Q. Thompson, who spoke on tumors of the neck. Carl Holm led the discussion following the paper on hand surgery.



The Salem Surgical Society was organized by a group of Salem surgeons in 1954. Meetings are held four times each year and are open to all interested members of the medical profession.

President for 1958 is E. S. Vanderhoof, and E. Hume Downs is secretary.

President's Page

The component or county medical society is the most important unit of medical organization. It is on the local level where the authority is retained and where policy is formulated. The prominence of the county society perhaps is best indicated on realization of the fact that it is here, in your own communities, where a physician is accepted into medical organization. Approval for membership in a component society automatically qualifies the physician for membership in his state society and the American Medical Association. This month we give recognition to ten of our colleagues who have accepted responsibility as presidents of their respective societies. These men, who have gained the respect of their fellow practitioners, represent another vital segment of the dedicated members of our profession who give strength and meaning to the principles of the Oregon State Medical Society.

Report from Medical Disciplinary Board

JAMES H. BERGE, M.D.*
SEATTLE, WASHINGTON

The Washington Medical Disciplinary Act was sponsored by the doctors of the state because they considered the health and well-being of the people of the state to be of paramount importance. They recognized the fact that conduct of licensed physicians plays a vital role in preserving the health and well-being of the people. They also recognized the fact that the agencies which existed in 1955 to handle disciplinary proceedings for the members of the profession licensed to practice medicine and surgery were employed very infrequently. Consequently, there was no effective means of handling disciplinary proceedings when they were necessary for the protection of health of the public.

JAMES H. BERGE, M.D.

The Act became operative in October 1955 when the first Board was elected and installed in office. Previous to that time, many complaints had been received by grievance committees of the state and county societies but these grievances could be handled by such committees only if the doctor involved belonged to the organization of which the committee was a part. Many of the violations with which doctors were charged concerned doctors who were not members of any medical society and as a consequence none of the committees had jurisdiction over them. The Act passed in 1955 concerns all of the licensed doctors of the state and has nothing whatsoever to do with membership in any organization. If a doctor is licensed to practice medicine in the state of Washington, he comes under the jurisdiction of the Medical Disciplinary Board.

There is a great deal of misunderstanding about the law and I believe it is necessary to understand exactly what the law says before any of us can understand why we should or should not enter complaints against another doctor.

The Act defines unethical conduct by listing 14 different points. These are:

1. Conviction in any court of an offense involving moral turpitude in which case the record of such conviction shall be conclusive evidence;
2. Procuring, or abetting, or aiding in a criminal abortion;
3. Fraud or deceit in obtaining a license to practice medicine;
4. All advertising of medical business which is intended or has a tendency to deceive the public or impose on credulous or ignorant persons and so be harmful or injurious to public morals or safety;
5. All advertising of any medicine or any means whereby the monthly periods of women can be regulated or a menses be established if supressed;
6. Impersonation of another licensed practitioner;
7. Habitual intemperance;
8. Use or prescription for use of narcotic drugs in any way other than for therapeutic purposes;
9. Offering, undertaking or agreeing to cure or treat disease by a secret method, procedure, treatment or medicine, or the treating, operating or prescribing for any human condition by a means, method or procedure which the licensee refuses to divulge upon demand of the court;
10. Willful betrayal of a professional secret;
11. Repeated acts of immorality, or repeated acts of gross misconduct in the practice of the profession;
12. Unprofessional conduct as defined in chapter 1968

(Continued on page 516)

(Continued from page 515)

of Remington's code of Washington which has to do with splitting of fees between optometrist and the man who grinds the lens.

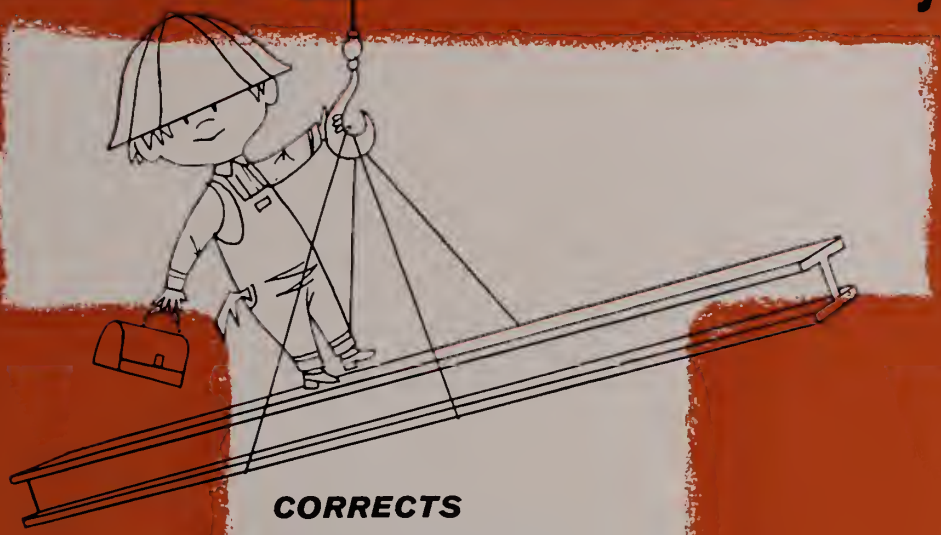
13. Aiding or abetting an unlicensed person to practice medicine;

14. Declaration of mental incompetency by a court of competent jurisdiction.

As you will note, the Board does not hear cases of disputes between hospital administrations and staffs or between doctors. It has nothing to do with exorbitant fees, nothing to do with malpractice and it has nothing to do with disputes between doctor and patient unless in such disputes one of these articles of unprofessional conduct has been involved. Interpretation of the 14 items constituting unprofessional conduct is of paramount importance.

Conviction in any court involving moral turpitude has been decided by the Supreme Court of the State of Washington in two income tax evasion cases, and therefore is of record.

The other items are self-explanatory with the exception of item 11 which says repeated acts of immorality or repeated acts of gross misconduct in the practice of the profession shall constitute unethical conduct. This is the catch-all of the law and its interpretation is completely in the hands of the Medical Disciplinary Board until there has been decision on a case and it has been reviewed by the Supreme Court.



The Board has a right to adopt, amend, and rescind such rules and regulations as it deems necessary to carry out the provision of this act. Any person, firm, corporation or public officer may submit a written complaint to the secretary of the Board charging the holder of a license to practice medicine and surgery with unprofessional conduct and specifying the grounds on which the charge is made. These complaints then come to the Board and are reviewed. The Board determines whether or not such a complaint merits consideration, and in the event it does not merit consideration, the case is closed. If the Board determines that the complaint merits consideration, a hearing committee is named, and the secretary prepares a specification of the charge or charges of unprofessional conduct made against the license holder. A copy of this is served upon the accused, together with a notice of the hearing. Time of the hearing is fixed by the secretary as soon as convenient but not earlier than 30 days after services of the charge upon the accused. The hearing committee consists of three members of the Board who hear the case and make their report to the Board as a whole. The Board then decides whether or not to accept the report of the hearing committee or may decide to hold a hearing with the entire Board preesnt. The Board has the power to issue subpoenas, to compel the presence of witnesses, and to administer oaths. Any failure to obey the order of the Board may be punished by the court as a case of civil contempt. After a hearing is held, the case is dismissed or a sentence is pronounced, depending upon the decision of the Board. This finding is then filed in the office of

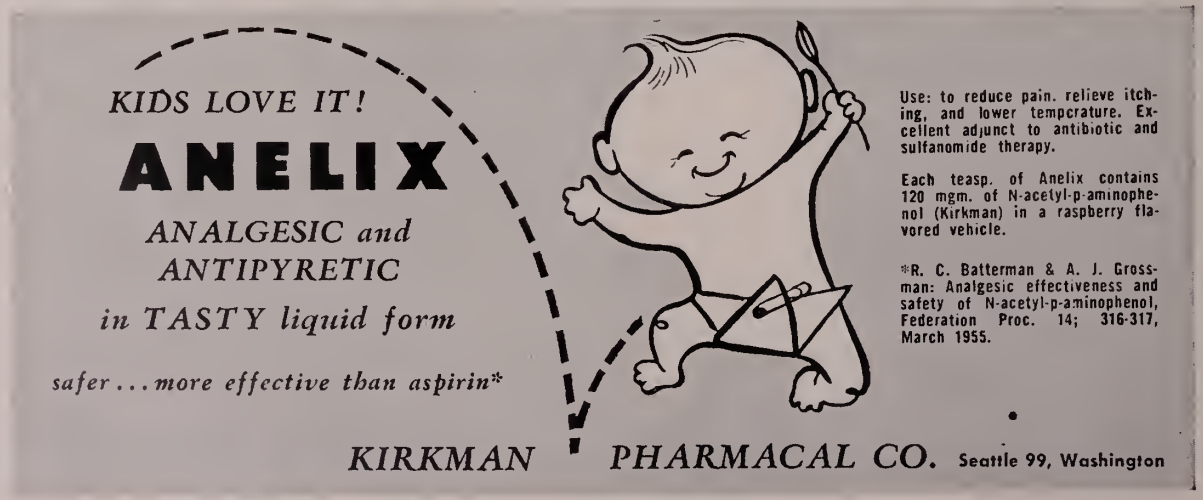
(Continued from page 516)
the Director of Licenses, and, when applicable, a certification of revocation or suspension is issued by that department. The licensee may seek a judicial review of the Board's decision. During such review, the revocation or suspension of his license is stayed and is not effective nor does it commence to run until final judgment has been entered and any proceeding instituted by the licensee has been concluded.

The Board is represented by the Attorney General and we have had excellent cooperation from his office. We are often unable to determine whether or not a case comes under our jurisdiction and in such cases make it a practice to ask the Attorney General's office for an opinion. This has always been given us, but we are not bound to accept it—it is advisory only.

As I stated previously, the great catch-all in the items defining unprofessional conduct is No. 11—repeated acts of immorality or repeated acts of gross misconduct in the practice of the profession. This must be interpreted by the Board. In the past we have had many complaints from lawyers and judges as to the biased and slanted testimony of doctors in the courtroom. Various plans have been promulgated in other jurisdictions to solve this problem, notably the New York Plan and the Minnesota Plan, but none of them have been satisfactory.



It is the feeling of the Board that there is a distinct difference between legal perjury and medical perjury. I recall one doctor who testified in the case of a woman who was six weeks pregnant at the time of an automobile accident. The case came up for trial some six weeks before her baby was to be born and one doctor testified in the case, saying that he felt the baby would be marked and a nervous wreck all of its life because of the fright of the mother when she was six weeks pregnant. This was a gross misstatement with which no other doctor agreed. This man was cited before the board of trustees of his medical society for perjury. He stated that, although he knew that no one else in the medical profession believed that such was the case, it was his own personal opinion and therefore he had not perjured himself because he had said exactly what he believed to be true. The board of trustees at that time was advised by the society's attorneys that this did not constitute perjury, in a legal sense. However, it is our feeling that it did constitute perjury in a medical sense, and that the doctor had perjured himself. At the present time, we would have heard that case before the Medical Disciplinary Board. We feel that such statements in the courtroom constitute gross immorality.

There is also the doctor who repeatedly testifies in personal injury cases at variance with all the other doctors who have seen the case, and we feel that his testimony should be open to review by the Board.

Since the Board was organized we have reviewed 30 cases. These have been broken down as follows:

Category	*Number of Cases*	*Action*
Unprofessional Conduct	1	License revoked
Addiction to Narcotics	3	Deferred for further information
Erroneous Diagnosis	3	Dismissed for insufficient evidence
Unethical	1	Dismissed for insufficient evidence
Use of Narcotics	1	Referred Narcotics Bureau
Maltreatment and Brutality	1	Closed—insufficient evidence
Unethical behavior in connection with patients committed to mental institutions	3	Closed after investigation
Betrayal of Professional Secrets	1	Case closed
Errors of Medical Treatment	3	Closed for insufficient evidence
Income Tax Evasion	2	Licenses suspended
Improper Treatment	2	Referred to grievance committee
Overcharging	2	Closed for insufficient evidence
Incompetence	1	Pending further action
Abortion	1	Deferred for more information; California license revoked 1955
License obtained by Fraud	1	Dismissed; insufficient evidence

In conclusion, I feel that the Board has functioned very well and that the Medical Disciplinary Law has operated for the benefit of the public as well as the doctors. Every case that has come before us has been thoroughly investigated. Some of the cases have not been of the type the Board could hear, and those cases have been dismissed. I feel that in the future many of these problems which I have cited in this article will be resolved by decision of the Supreme Court and until that time the Board must make its own decisions.

Gunnar Gundersen, AMA President-Elect, To Address 1958 Annual Session

Gunnar Gundersen of LaCrosse, Wisconsin, president-elect of the American Medical Association, will be featured speaker at the 1958 convention of the Washington State Medical Association, according to an announcement by President Milo T. Harris.

GUNNAR GUNDERSEN, M.D.

Dr. Harris also announced the selection of five outstanding guest speakers for the scientific program of the convention, which will be held September 14-17 in Spokane, with headquarters at the Davenport Hotel. Arrangements are being made for a sixth guest scientific speaker, whose name will be announced in the near future.

Dr. Gundersen will deliver an inspiring message based on his many years as a physician and long experience in organized medicine. He was a member of AMA Board of Trustees for nine years, the final two years as chairman, prior to being named president-elect last year. He will assume the presidency in June.

The guest scientific lecturers will address general sessions in the afternoons of Tuesday and Wednesday, September 16 and 17, and will also speak at the six refresher courses planned for the morning programs those days, according to Clyde A. Stevenson of Spokane, chairman of the Scientific Program Committee.

The speakers and their topics for the afternoon programs are as follows:

John Caffee, New York, professor of radiology at Columbia University and radiologist to Babies Hospital, Presbyterian Hospital and Vanderbilt Clinic: The Osteochondroses and Normal Variation in the Growing Skeleton, and Radiographic Signs of Mongoloidism During Early Infancy.

Walter A. Fansler, Minneapolis, clinical professor and director of the Division of Proctology, University of Minnesota Medical School: Polyps of the Colon, and Hemorrhoids and Fissures.

W. S. Middleton, Washington, D.C., chief medical director, Department of Medicine and Surgery, Veterans Administration: Aneurysm of the Aorta.

Robert D. Murray, head, Department of Orthopedics, Scott and White Clinic, Temple, Texas: Osteomyelitis, and Fractures of the Elbow.

Lucian Smith, Rochester, Minnesota, assistant professor of medicine, Mayo Foundation: Abdominal Pain.

Schedules and subjects of the refresher courses to be given during the morning sessions will be announced in the near future.

Walla Walla Valley Medical Society

Richard Kleaveland of Spokane was guest speaker at the January dinner meeting of the Walla Walla Valley Medical Society. Dr. Kleaveland spoke on Recent Developments in Vascular Surgery.

Orvar Swenson To Speak May 3 At Tacoma Surgical Club Annual Session

Orvar Swenson, professor of pediatric surgery at Tufts University School of Medicine, Boston, Mass., will be guest speaker at the 27th Annual Meeting of the Tacoma Surgical Club. The meeting will be held at Jackson Hall in the Tacoma General Hospital, Saturday, May 3.

As in the past, morning session will be devoted to anatomic dissections and demonstrations and afternoon session to presentation of scientific papers.

Following is the program as reported by Dumont S. Staatz of Tacoma, secretary-treasurer of the organization:

PROGRAM

The Tacoma Surgical Club
Twenty-Seventh Annual Meeting
Saturday, May 3, 1958

Jackson Hall—Tacoma General Hospital

MORNING SESSION:
Anatomic Dissections and Demonstrations

LUNCHEON—1:00 P.M.:
Cafeteria, Tacoma General Hospital, $1.50

AFTERNOON SESSION—2:15 P.M.:
1. Discussion of Morning Session—ORVAR SWENSON
2. Megacolon—ORVAR SWENSON
3. Chief Complaint, Pain in the Knee—ROBERT W. FLORENCE
4. Tumors of the Neck in Children JOHN T. ROBSON
5. Coffee Break—10 minutes
6. Intestinal Polyps; Problems and Importance in Children—ROBERT R. BURT
7. Inguinal Herniorrhaphy in Infants and Children; When? Why? How?—STANLEY W. TUELL
8. Discussion of Program—ORVAR SWENSON

EVENING SESSION:
6:00 P.M.—Social Hour; 7:00 P.M.—Banquet (Informal), Tickets $7.50—Bay View Room, Hotel Winthrop
EDWARD R. ANDERSON, presiding
Address—Principles of Pediatric Surgery—ORVAR SWENSON

Yakima County Medical Society

Guest speakers at the February meeting of Yakima County Medical Society were two Seattle physicians, Samuel Aronson, president of Washington State Heart Association, and Donal Sparkman, chairman of the American Heart Association's Rehabilitation Committee. Topics of discussion were Cardiac Rehabilitation and State Industrial Compensation Cardiac Cases.

Other guests present at the meeting were William J. Foley, Medical Director, Washington State Department of Labor and Industries, and Lloyd Farner, Medical Consultant to Department of Vocational Rehabilitation. Drs. Foley and Farner while in Yakima also attended the two-day workshop on heart rehabilitation for public agencies, physicians, and business and labor sponsored by the South Central Branch of the State Heart Association.

Statewide Activities To Promote Medical Education Week, April 20-26

The third annual observance of Medical Education Week will be conducted in the state of Washington and across the nation April 20-26. The Washington State Medical Association, local medical societies and the University of Washington School of Medicine will cooperate in the program.

A salute to medical school progress, the special week has been set aside for informing the public of the important role played by the medical schools and their graduates in the health and well-being of the nation. It offers a special opportunity also to show the doctor as an integral member of the community, and to demonstrate the training necessary to produce a physician.

So that the public may see and appreciate what is being done in medical education in this state, the University of Washington School of Medicine will hold open house Thursday, April 24, from 2 to 10 p.m. The open house will include not only the medical school, but also the schools of dentistry, pharmacy and nursing. This event last year attracted more than 4,000 persons, a large proportion of whom were young people potentially interested in health and science careers.

More than 50 displays and demonstrations will be shown at the open house, including the artificial heart-lung machine, electric eels used in the study of body-cell electric potentials, demonstrations of patient care by nursing students, the medical instrument shop and the 110-chair main dental clinic. A special feature will be the exhibit, "Life Begins," loaned by the American Medical Association.

Plans have been made for the use of various media in providing information to the public. In addition to coverage arranged by local committees, special news releases and feature materials will be sent to daily and weekly newspapers to focus public attention on the ever-increasing contribution of medicine to American life and the basic significance of medical education. A special, taped radio program will be made available to all radio stations in the state. Television programs also are contemplated.

Supplementing the promotion through the news media will be speaking engagements before luncheon and service clubs, exhibits and window displays.

Francis M. Lyle of Spokane is state chairman for Medical Education Week. Members of his committee are Arnold J. Herrmann, Tacoma; Leif K. Pratum, Seattle; and C. R. Viers, Ferndale.

Tularemia Cases Reported by Health Dept.

Two confirmed cases of tularemia, Washington's first since 1955, were reported during February by the State Health Department. The victims, both Thurston county residents, contracted the disease last November while trapping muskrats in the Ellensburg area. The cases, however, were not reported until early January and the men were still undergoing treatment at the time of the announcement by the Health Department.

State Association of Blood Banks Holds Annual Meeting in Seattle

Representatives from 10 National Blood Banks and approximately 40 physicians and medical technicians attended the seventh Annual Meeting of Washington State Association of Blood Banks at the King County Central Blood Bank in Seattle March 8.

The scientific program was presented by Neville Hughes-Jones, Beverly Gabrio, Ph.D., and Eloise Giblett, all staff members of the King County Blood Bank. They spoke on research problems affecting erythrocyte destruction and preservation, and problems connected with abnormal antibodies and their detection in blood transfusions.

Business portion of the meeting included discussions of the National Clearing House Program, Civil Defense problems connected with blood banking, establishment of a central office for the American Association of Blood Banks, and the election of officers. The following were re-elected: Robert P. Gill, Whatcom County Blood Bank, president; Mr. Earle Gibb, Whatcom County Blood Bank, secretary-treasurer; Mr. Donald T. Dougherty, Spokane and Inland Empire Blood Bank, vice-president, and Mr. Soren Juul, King County Blood Bank, and C. C. Christianson, Spokane and Inland Empire Blood Bank, trustees.

Bellingham Physician Appointed Temporary Head at Eastern State

Sheldon C. Bajema, former Bellingham and Lynden physician, is serving as temporary head of the maximum security building at Eastern State Hospital, Medical Lake, pending the appointment of a permanent successor to E. R. Hodgson who resigned in January.

Dr. Bajema was a staff physician at the hospital in 1955 and 1956. He served as City Health Officer at Lynden in 1940 and 1941 and following his discharge from the Air Force in 1944, he opened his practice in Bellingham.

A spokesman for the State Legislative Council's Committee on Institutions has reported that the following changes either have already been made or are contemplated to improve the security and service at the hospital:

Only the criminally insane and psychotics will be assigned to the hospital. The hospital superintendent will interview and examine psychotics before they are admitted to the security unit.

Security unit guards will wear hospital uniforms instead of police-type uniforms and the term *guard* will be discarded.

UWSM Receives Funds from A.M.E.F.

The University of Washington School of Medicine has received a gift of $7,022.09 from the American Medical Education Foundation of Chicago. According to Francis M. Lyle of Spokane, state chairman for the Foundation, donations to the fund by Washington physicians in 1957 totaled $9,115.82, largest amount contributed to date.

WAGP Annual Meeting in Yakima May 30-31 To Have "Professional Holiday" Theme

General practitioners from throughout the state will gather at the Chinook Hotel in Yakima May 30 and 31 for the annual meeting of the Washington Academy of General Practice. Falling as it does on the Memorial Day weekend, the meeting will have the theme, "Professional Holiday for the Family Doctor and His Family."

The two-day session will include exhibits, medical movies, scientific papers, and discussion and question periods. Scheduled entertainment includes a one act play by the Little Theatre Group, Swiss yodelers, and a chartered plane flight over the Cascades.

Banquet speaker will be E. Cowels Andrus, Past-President of American Heart Association. Dr. Andrus is in charge of the Cardiology Clinic and Professor of Medicine at Johns Hopkins University School of Mediicne, Baltimore, Maryland. His subject will be announced.

Other guest speakers and their subjects are: Joel Baker, Seattle, President-Elect of American College of Surgeons—Abdominal Emergencies; Louis A. Buie, Rochester, Minn., Emeritus Professor of Proctology at Mayo Foundation Graduate School of University of Minnesota, Member of the Judicial Council of AMA, Editor-in-Chief of *Diseases of the Colon and Rectum*—Management of Surgical Conditions of the Rectal Outlet, and narrated movie on Endoscopic Lesions of the Terminal Portion of the Colon; Charles E. McLennan, San Francisco, Professor and Head of the Department of Obstetrics at Stanford University School of Medicine—How to Deal with Abnormal Uterine Bleeding, and Uterine Cancer in General Practice; George R. Cowgill, PhD., New Haven, Conn., Professor of Nutrition at Yale University, and Head of the Yale Nutrition Laboratory, discoverer of vitamin B in its relationship to neuritis, published in 1934 the monograph entitled Vitamin B Requirement of Man—Nutrition as a Science Important for Medicine, and Nutrition in Medical Practice; Vincent C. Di Raimondo, San Francisco, Associate Professor of Medicine at University of California School of Medicine, Metabolic Unit of the University Associated with Peter H. Forsham—Clinical Applications of Recent Advances in Endocrinology, Parts I and II; Erroll W. Rawson, Seattle, Past-President of Washington Academy of General Practice—Lesions of the Breast; Joe Telford, San Diego, Cal., immediate Past-President of California Academy of General Practice, Member of the Membership and Credentials Commission of the American Academy of General Practice, President-Elect of the San Diego County Medical Association—General Practitioner of the Future.

Special feature for Friday afternoon is a two-hour panel on psychiatry to be moderated by Austin Kraabel of Seattle, chairman of Washington State Mental Health Survey Commission in 1955 and 1956, and Past-President of Washington Academy of General Practice. In addition to Dr. Kraabel, George Saslow of Portland, Professor of Psychiatry at the University of Oregon Medical School, and Frederick Lemere of Seattle, Clinical Professor of Psychiatry at the University of Washington School of Medicine, will speak on the panel. Dr. Saslow will discuss Emotional Aspects of Chronic and Serious Disease. Dr. Lemere will present a paper on Pharmacologic Treatment of Depression.

Poison Control Center Established in Vancouver at St. Joseph Hospital

Newest poison information center in Washington was set up at St. Joseph Hospital in Vancouver late in January. As with all poison control centers in the state, it is operated on a 24-hour basis under the supervision of a medical committee and provides physicians information about poisonous substances and treatment from its extensive, up-to-date file on products containing poisonous substances, poisons and their antidotes.

In a year-end report, the Spokane Poison Control Center, which is located in the emergency department of Deaconess Hospital, stated it handled 301 calls during its 10 months of operation, with 138 of the cases requiring medical attention.

Report for 1957 from the Seattle Poison Control Center in Children's Orthopedic Hospital noted that 1,275 calls were handled, with 309 children requiring emergency treatment. Among the cases, 475 were children from 1 to 2 years old; 377 were 1 to 3 years, and 208 were children 3 to 4 years. Aspirin headed the list of substances swallowed with 218 cases reported.

Centers in Washington State and their telephone numbers are as follows:

Olympia Poison Control Center—FLeetwood 2-3031, located at St. Peter Hospital.

Seattle Poison Control Center—LAkeview 4-4300, located at Children's Orthopedic Hospital.

Spokane Poison Control Center—RIverside 7-4811, located at Deaconess Hospital.

Tacoma Poison Control Center—GReenfield 4-0561, located at Pierce County Hospital.

Vancouver Poison Control Center—OXford 3-4791, located at St. Joseph Hospital.

Obituaries

Dr. Edward W. Templeton, 67, who had practiced in Snoqualmie the past 30 years, died February 11 at his Seattle home of a coronary thrombosis. Dr. Templeton received his medical degree in 1915 from Jefferson Medical College of Philadelphia. A daughter, Helene Templeton, practices medicine in Seattle.

Dr. William C. Riddell, 94, retired Seattle and Helena, Mont., surgeon, died January 14 of cardiac failure due to generalized arteriosclerosis. Dr. Riddell was graduated from the University of Michigan Medical School in 1886. He was a lieutenant colonel in the Army Medical Corps in France during World War I and had practiced intermittently in Seattle from about 1921 to 1947. While in Helena, Dr. Riddell served about 25 years as a member of the Montana State Board of Medical Examiners.

Dr. Samuel Max, 67, retired Snoqualmie physician, died February 6 in Huntington Park, Calif., where he was visiting relatives. Dr. Max received his medical training at Northwestern University Medical School from which he was graduated in 1916. He practiced briefly in Blaine before locating in Snoqualmie about 1920. He had retired from active practice in 1950.

Governor Establishes Inter-Agency Committee on Health, Education and Welfare Programs

A Washington state Inter-Agency Committee on Health, Education and Welfare Programs has been established by Governor Rosellini. The committee is composed of the directors and chief deputies of the state departments of Public Assistance, Health, Institutions, Public Instruction, Employment Security and Vocational Rehabilitation. Bernard Bucove, state director of health, is chairman.

Objectives of the committee, as stated in the minutes of its organizational meeting, held January 29, are "to reduce expense to the taxpayer, make the most efficient use of agency resources in related programs, and thus to improve and strengthen services to the people in the area of health, education and welfare."

Some inter-agency coordination and exchange of information existed before establishment of the new committee. It was stated at the meeting, however, that "some areas of cooperation leave much to be desired, such as: (1) the development of new programs; (2) the development of legislation; (3) the development of budget, and (4) a coordinated approach to the public."

A primary goal of the committee will be to determine the basic role of each department. The next step will be to outline an overall, statewide program, with each department's role as well defined as possible, and as coordinated with each other as is practical.

The commitete decided to start with a review of the progress of the previously existing Inter-Agency Committee on Mental Retardation. The governor said the success of this body had prompted him to set up the new committee, so that this kind of cooperative relationship might be put on a sounder and more formal basis.

The committee will set up subcommittees whenever more than two agencies are involved, or otherwise as need arises. Advisory commitees also will be established, as felt necessary by the subcommittees, and will be composed of representatives of official, voluntary and lay groups.

The parent committee plans to meet monthly, on the first Tuesday of each month.

Lehman Heads National Public Health Group

Sanford P. Lehman, director of Seattle-King County Health Department, has been elected president of the American Association of Public Health Physicians. Dr. Lehman is a charter member of the Association which includes more than 600 physicians throughout the country. The group meets twice a year in conjunction with meetings of the American Medical and American Public Health Associations.

Seattle Surgical Society Elects

Wilbur E. Watson is newly elected president of the Seattle Surgical Society. Dr. Watson was installed in office at conclusion of the Society's annual clinical meeting last month. He succeeds J. Irving Tuell. Other officers are: Charles E. MacMahon, president-elect; Allan W. Lobb, treasurer; Waldo O. Mills, secretary, and John W. Finley, assistant secretary.

Booklets on Low-Sodium Diets Available

Copies of three new booklets for adult heart patients on sodium-restricted diets are now available to physicians and also to patients on a physician's prescription. The booklets are published by the American Heart Association and were prepared under direction of a committee made up of representatives from AMA Council on Foods and Nutrition, Heart Association, U.S. Public Health Service, American Dietetic Association and the Nutrition Foundation.

Each booklet contains aids for the patient who is following the physician's prescription for a certain degree of sodium restriction: strict, 500 mg.; moderate, 1,000 mg.; and mild. Three different calorie levels—1,200 calories, 1,800 calories and unrestricted—are included also in each of the booklets. Food lists to enable the patient to vary his meals are given as well as practical suggestions on eating out and shopping for food. In addition, weight watching, meal planning and problems of the family cook are discussed.

Single copies may be obtained without charge from Washington State Heart Association, 3121 Arcade Building, Seattle.

Tax Council in Seattle April 18

The 15-member Tax Advisory Council, appointed by Governor Rosellini shortly after adjournment of the 1957 session of the Legislature, has scheduled a public hearing in Seattle April 18. All interested persons are invited to present their views on the state tax structure at the hearing.

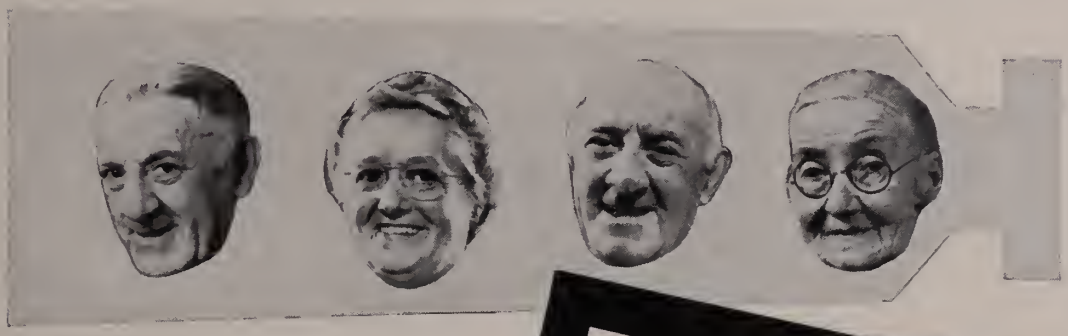
The Council, whose members were selected from all parts of the state as representing the major segments of the state's economy, has the responsibility of submitting a report to the Governor on September 1. This report, based on the committee's findings, will propose a tax structure for the state which will yield adequate revenues equitably and with minimum adverse effect on the development of the state.

Committee Appointed for Medical Care of Mentally Retarded Children at Selah

Wesley D. White, director of Rainier State School at Buckley, recently named three Yakima pediatricians to serve as a committee for medical care of mentally retarded children at the former Central Washington Tuberculosis Hospital at Selah.

Willard B. Rew, Robert Crose and Walter Kennedy, Jr., are providing needed medical care for the children at the hospital, which has been changed over to a custodial school for mentally retarded persons.

The three physicians are continuing full-time private practice in Yakima along with their duties at the Selah institution.



Grangeville Physician Honored

William H. Cone, Grangeville physician and surgeon, recently was presented with the Grangeville Junior Chamber of Commerce distinguished service award as the "outstanding young man of 1957."

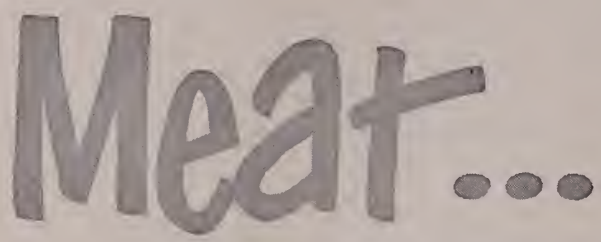
"Doctors can't help shingles?"



Physicians who have used PROTAMIDE extensively deplore such statements as unfortunate when they appear in the lay press. They have repeatedly observed in their practice quick relief of pain, even in severe cases, shortened duration of lesions, and greatly lowered incidence of postherpetic neuralgia when PROTAMIDE was started promptly. A folio of reprints is available. These papers report on zoster in the elderly—the severely painful cases—patients with extensive lesions. PROTAMIDE users know "shingles" *can* be helped.

and the Medically Acceptable Reducing Diet

In any medically acceptable reducing diet prescribed today, meat can serve as an important nutritional component.

Curtailment of the daily calorie allowance must not deny the patient the protein, vitamins, and minerals required for good nutritional health. Fad diets which eliminate certain basic foods can hardly be considered medically acceptable.

Calorie for calorie, no other commonly eaten food supplies the quality and quantity of protein which lean meat provides. Its B vitamins and minerals are needed daily, regardless of calorie restrictions.

Even when coexistent pathological conditions require that the calorie-reduced diet be further limited to foods low in fiber or in sodium, meat fills the same important place in each day's food allowance. The fat content of lean meat is relatively low, and meat can be prepared in various ways, as called for by almost every special diet.

In any diet which must deviate from accustomed eating habits, the taste appeal of meat makes it easier for the patient to adhere to the restrictions imposed.

The nutritional statements made in this advertisement have been reviewed by the Council on Foods and Nutrition of the American Medical Association and found consistent with current authoritative medical opinion.

SIXTY-SIXTH ANNUAL MEETING
July 6-9, 1958
Sun Valley

President, H. B. Woolley, M.D., Idaho Falls Secretary, W. B. Ross, M.D., Nampa Exec. Secy., Mr. A. L. Bird, 364 Sonna Bldg., Boise

State Officers and Councilors Visit Component Societies

The Officers and Councilors started their 1958 visits to all of the component medical societies on March 11 when they met with officers, members and the auxiliary of the South Central Idaho District Medical Society in Jerome.

Participating in the meeting were President Hoyt B. Woolley, Idaho Falls; Immediate Past-President Charles A. Terhune, Burley; President-Elect Donald K. Worden, Lewiston; Secretary-Treasurer W. B. Ross, Nampa; Councilor F. Wayne Schow, Twin Falls; A.M.E.F. Chairman Jerome K. Burton, Boise; AMA Legislative Chairman E. V. Simison, Pocatello; Councilor Asael Tall, Rigby, (Dist. No. 4), and the Executive Secretary.

State Auxiliary officers who participated in the session included Mrs. Hoyt B. Woolley, Idaho Falls, president, and Mrs. E. R. W. Fox, Coeur d'Alene, president-elect.

Association Officers and Councilors met with officers and members of the Southwestern Idaho District Medical Society in Boise March 12.

State officers who participated in this meeting included President Woolley; President-Elect Worden; Secretary-Treasurer Ross; Councilor Frank L. Fletcher, Boise; Councilor Tall (Dist. No. 4); A.M.E.F. Chairman Burton; AMA Legislative Chairman Simison, and Executive Secretary Bird.

The auxiliary met separately for this meeting.

State Board of Medicine

C. Gedney Barclay of Coeur d'Alene has been appointed a member of the State Board of Medicine by Governor Robert E. Smylie to complete the unexpired term of Clyde E. Culp of Moscow, who resigned effective February 1 to accept a four-year fellowship in proctology at Mayo's. Dr. Barclay served a four-year term as a member of the first State Board of Medicine appointed in 1949 by then Governor C. A. Robins.

Dr. Barclay's term will run until March 21, 1959.

A temporary license was issued in February to:

John William Armstrong, Lewiston. A graduate of the University of Texas School of Medicine, Galveston. M.D. degree 1940. Internship Harper Hospital, Detroit, Michigan, 1941. Residency, Internal Medicine, Cleveland City Hospitals, 1946-48, and Southern Pacific Hospital, Houston, Texas, 1948-49. Granted T-200 on February 7. Internal Medicine.

Association Committees Meet

The Association's Public Health Advisory Committee met with officials of the State Department of Public Health in Boise on March 8. F. Wayne Schow, Twin Falls, is Chairman of the committee. Other members include Leland K. Krantz, Idaho Falls; Alexander Barclay, Coeur d'Alene; John R. McMahon, Poactello, and J. R. Farber, Nampa.

Terrell O. Carver, State Director, and Fred O. Graeber, Director, Crippled Children's Services, represented the Health Department at the session.

The Association's Constitution and By-Laws Committee met in Boise on Wednesday, March 12. Asael Tall, Rigby, is Chairman of the committee. Other members are Casper Pond, Pocatello, and C. Gedney Barclay, Coeur d'Alene.

Board of Health Appointment

Governor Robert E. Smylie has appointed Mr. George W. Watkins, Idaho Falls, as a member of the State Board of Health replacing Mr. Harry Elcock, Twin Falls, who resigned several months ago when he moved to Utah. Mr. Watkins is President of the Snake River Equipment Company, Idaho Falls and a member of the Board of Directors of the Federal Reserve Bank, San Francisco.

Paul M. Ellis, Wallace, is Chairman of the Board of Health. Other members include Mr. Hugh Wagnon, Pocatello; Mr. H. Westerman Whillock, Boise, and Mr. Fran L. Blomquist, Caldwell.

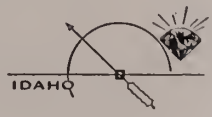
County Societies Elect Officers

Newly elected officers of Upper Snake River Medical Society for the coming year include:

PRESIDENT—W. A. Melcher, Ashton.

VICE-PRESIDENT—Robert R. Klamt, St. Anthony.

SECRETARY—Blaine H. Passey, Rexburg (re-elected).



TREASURER—Emory L. Soule, St. Anthony (re-elected).

Shoshone County Medical Society elected the following officers for the current year at a meeting in February:

PRESIDENT—Albert M. Peterson, Wallace.

VICE-PRESIDENT—Orland B. Scott, Kellogg.

SECRETARY-TREASURER—Ernest E. Gnaedinger, Wallace.

Synatan employs DURABOND*

- a true repository technic for prolonging therapy from a single dose of oral medication
- technic is a depot action analogous to that of long-acting protamine-zinc insulin . . . a large molecular polyionic complex acts as a bonding agent
- employs no resins, wax or enteric coatings of any kind . . . release is independent of intestinal motility or specific pH
- provides prolonged, gradual, uniform amphetamine release with no peaks or valleys of activity . . . no sudden bursts of drug release
- incorporates no "drug traps" — the amount of drug given is the amount of drug released, and all is available for absorption
- provides greater anorexic action while minimizing overstimulation

Synatan contains tanphetamin (dextroamphetamine tannate) 17.5 mg. in a Durabond tabule. *Also available*—SECO-SYNATAN®, Synatan plus secobarbital in a Durabond tabule.
Dosage—1 or 2 tabules at 10 a.m. for all-day control. For prescription economy prescribe in 50's.
To serve your patients today—call your pharmacist for any additional information you may need to help you prescribe Synatan and Seco-Synatan.

*Patent Pending

Arthritis Foundation Sponsors Clinic in Boise

Idaho Chapter of the Arthritis and Rheumatism Foundation sponsored a clinic at the Idaho Elks Rehabilitation Center, Boise on February 28. Roscoe C. Ward, Boise, arranged an excellent program and during the clinic 44 cases were presented. Clinicians who participated in the session included: R. E. Rinehart, Wheeler, Oregon; Edward E. Rosenbaum, David K. Taylor, Arthur C. Jones, and Paul Campbell, all of Portland, Oregon.

Idaho State Radiological Society

Newly elected officers of the Idaho State Radiological Society are: Donald D. McRoberts, Lewiston, president; Alfred Stone, Boise, vice-president, and Charles R. McWilliams, Twin Falls, secretary-treasurer. Next meeting of the society is set for May 31 at Pocatello.

Present aims of the group, which was organized in 1950, are to clarify and stabilize the hospital-radiologist relationship under the Medical Practice Act of the State of Idaho, and to promote the cause of better radiologic practice in Idaho.

ANNUAL MEETING
May 15-17, 1958
Fairbanks

Secretary, Robert B. Wilkins, M.D., Anchorage

Program Planned for ATMA Annual Session in Fairbanks May 15-17

Members and guests attending the 13th Annual Convention of Alaska Territorial Medical Association in Fairbanks May 15-17, will find two innovations added to the program. For the first time there will be a narrated movie session and a breakfast round-table discussion. The movies are scheduled for the evening of the first day of the meeting and the breakfast round-table will be held the second day of the session, Friday, May 16.

Mrs. E. A. Underwood of Vancouver, Wash., president-elect of AMA Auxiliary, will address the ATMA Auxiliary as main speaker of their program. Mrs. Underwood, who is a practicing dentist, will also address the Association Convention on the subject of dentistry.

Henry G. Storrs of Fairbanks, program chairman, reports the following as the tentative program and list of guest speakers and subjects for the 1958 Annual Session:

Tentative Program
Alaska Territorial Medical Association
13th Annual Meeting

Thursday, May 15:

8:00 A.M.	Registration
9:00 A.M.	Report from Government Agencies
10:30 A.M.	Recess—Visit Exhibits
11:00 A.M.	Business Meeting
12:00 Noon	Lunch
1:30 P.M.	Scientific Session
3:00 P.M.	Recess—Visit Exhibits
3:30 P.M.	Scientific Session
5:00 P.M.	Dinner
7:30 P.M.	Narrated Movies

Friday, May 16:

7:30 A.M.	Breakfast Clinic—Radiation Medical Problems in the Territory
9:00 A.M.	Business Meeting
10:30 A.M.	Recess—Visit Exhibits
12:00 Noon	Lunch
1:30 P.M.	Scientific Session
3:00 P.M.	Recess
3:30 P.M.	Scientific Session
7:00 P.M.	Annual Banquet

Saturday, May 17:

9:00 A.M.	Business Meeting
10:30 A.M.	Recess—Visit Exhibits
12:00 Noon	Lunch
1:30 P.M.	Scientific Session
3:00 A.M.	Recess
3:30 P.M.	Scientific Session
5:00 P.M.	Adjournment

North Pacific Orthopaedic Society To Hold Annual Session in Tacoma

North Pacific Orthopaedic Society will hold its annual meeting Friday, May 9, and Saturday, May 10, in Tacoma. On Thursday evening, May 8, there will be a welcoming buffet dinner at the Top o' the Ocean.

The scientific program will be presented at Pierce County Medical Society Auditorium on the first floor of the Medical Arts Building. The County Society Auditorium and Headquarters will also be the place of registration, which will open at 8:00 A.M. Friday. Presidential Suite of the Hotel Winthrop will be the special gathering place for physicians and their wives.

The annual session is a closed meeting for members and guests. Those desiring additional information about the meeting are asked to contact the Society secretary: Dumont S. Staatz, M.D., 919 South Ninth, Tacoma, Wash.

Antivivisection Bill Introduced In Congress by Rep. Burdick

A bill to prohibit interstate shipments of any dog or cat for medical or other scientific experimentation has been introduced in Congress by Representative Usher Burdick of North Dakota. The bill calls for maximum penalties of $1,000 or imprisonment for one year to any person who "procures, obtains or facilitates . . . the transportation of any dog or cat in interstate commerce with the intent . . . that such dog or cat shall be used for purposes of vivisection, or for the purpose of medical or any scientific experimentation."

The Burdick bill was introduced on February 26 and bears the number H.R. 10996. It has been referred to the House Committee on Interstate and Foreign Commerce.

Since interstate shipments of animals are essential to many of America's medical research and teaching institutions, enactment of the Burdick bill would cripple their operations and thus inevitably cost human lives.

Physicians and medical societies can influence the consideration of the Burdick bill by writing to their own congressmen and to Representative Oren Harris, chairman of the House Committee on Interstate and Foreign Commerce, explaining what effect the bill would have on medical research and education.

RECEIVED

The following books have been received. Publication of this acknowledgment is to be considered adequate return to the sender. Selected titles will be reviewed as space permits.

A Therapy for Anxiety Tension Reactions. By Gerhard B. Haugen, M.D., Assistant Clinical Professor of Psychiatry, University of Oregon Medical School, Portland; Psychiatric Consultant to Oregon State Board of Parole and Probation; Henry H. Dixon, M.D., Clinical Professor and Head of Department of Psychiatry, University of Oregon Medical School; and Herman A. Dickel, M.D., Associate Clinical Professor, University of Oregon Medical School. 110 pp. Price $3.50. The MacMillan Co., New York. 1958.

The Essence of Surgery. By C. Stuart Welch, M.S., M.D., Ph.D., Professor of Surgery, Albany Medical College of Union University, Albany, N.Y.; and Samuel R. Powers, Jr., A.B., M.D., M.Sc.D., Professor of Experimental Surgery, Albany Medical College of Union University. 320 p. 50 figures. Price $7.00. W. B. Saunders Co., Philadelphia. 1958.

The Alimentary Tract of the Ruminant. By David Benzie, and A. T. Phillipson, M.A., Ph.D., M.R.C.V.S., F.P.S.E., The Rowett Research Institute, Buksburn, Aberdeenshire, Great Britain. 75 pp. Illustrated. Price $5.50. Charles C Thomas, Springfield, Ill. 1958.

Chemistry of Lipides as Related to Atherosclerosis —A Symposium. Compiled and edited by Irvine H. Page, M.D., Cleveland Clinic Foundation. Cleveland, Ohio. 342 pp. Price $8.50. Charles C Thomas, Springfield, Ill. 1958.

So You Want To Be a Doctor. By Alan E. Nourse, M.D., North Bend, Washington. 180 pp. Price $2.75. Harper & Brothers, New York. 1957.

Heart Disease—Cause, Prevention and Recovery. By Philip S. Chen, Ph.D., Professor of Chemistry and Chairman of Division of Natural Sciences, Atlantic Union College; with the assistance on Part I of Philip S. Chen, Jr., Ph.D., National Heart Institute. 189 pp. Illustrated. Price $3.00. Chemical Elements, South Lancaster, Mass. 1958.

The Chemistry of Blood Coagulation. By Paul Morawitz, Marburg, Germany. Translated by Robert C. Hartmann, M.D., and Paul F. Guenther, M.A., Ph.D., From the Departments of Medicine and German, Vanderbilt University, Nashville, Tennessee. 194 pp. Price $4.50. Charles C Thomas, Springfield, Ill. 1958.

Spinal Anesthesia. By John B. Dillon, M.S., M.D., Professor of Surgery and Chief of Division of Anesthesia, Department of Surgery, University of California Medical Center, Los Angeles; Formerly Associate Clinical Professor of Surgery (Anesthesia), University of Southern California and The College of Medical Evangelists, Los Angeles, Chief of Department of Anesthesia, Los Angeles County Hospital. 61 pp. Illustrated. Price $3.00. Charles C Thomas, Springfield, Ill. 1958.

Pharmacology and Therapeutics; Textbook for Students and Practitioners of Medicine and its Allied Professions. Ed. 3, Revised and Enlarged. By Arthur Grollman, Ph.D., M.D., F.A.C.P., Lecturer in Pharmacology and Toxicology, The Medical Branch, and Professor and Chairman of Department of Experimental Medicine, The Southwestern Medical School, The University of Texas; Attending Physician, Parkland Memorial Hospital; Consultant in Internal Medicine, Baylor University Hospital; Consultant, Veterans Administration Hospital, Dallas, Texas; Civilian Consultant, The Surgeon General, U. S. Air Force. 1046 pp. 192 illustrations. Price $12.50. Lea & Febiger, Philadelphia. 1958.

Therapeutic Heat. Edited by Sidney Licht, M.D., Honorary Member, British Association of Physical Medicine, Danish Society of Physical Medicine, and the French National Society of Physical Medicine. 466 pp. Price $12.00. Elizabeth Licht, New Haven, Conn. 1958.

for the best in tetracycline therapy... new, rapidly effective

COSA-TETRACYN

1. highest, fastest tetracycline blood levels

Analysis of a 4-way crossover study confirms that Cosa-Tetracyn produces the highest, fastest blood levels of all available tetracycline enhancement formulations.[1]

2. greatest consistency of high tetracycline blood levels

In a 4-way crossover study, Cosa-Tetracyn demonstrated greatest consistency of high blood levels compared to tetracycline-citric acid, tetracycline phosphate complex, and tetracycline-sodium hexametaphosphate.[1]

3. safe, physiologic advantages of glucosamine

Completely safe as an enhancement agent, glucosamine is nontoxic, sodium free, nonirritating to the gastrointestinal tract, and there is evidence it may influence favorably the bacterial flora of the intestine.

The most widely prescribed broad-spectrum antibiotic now potentiated with glucosamine, the enhancing agent of choice.

Cosa-Tetracyn is supplied in capsules, 250 mg., bottles of 16 and 100; and half-strength capsules (125 mg.) for long-term therapy or pediatric use, bottles of 25 and 100.

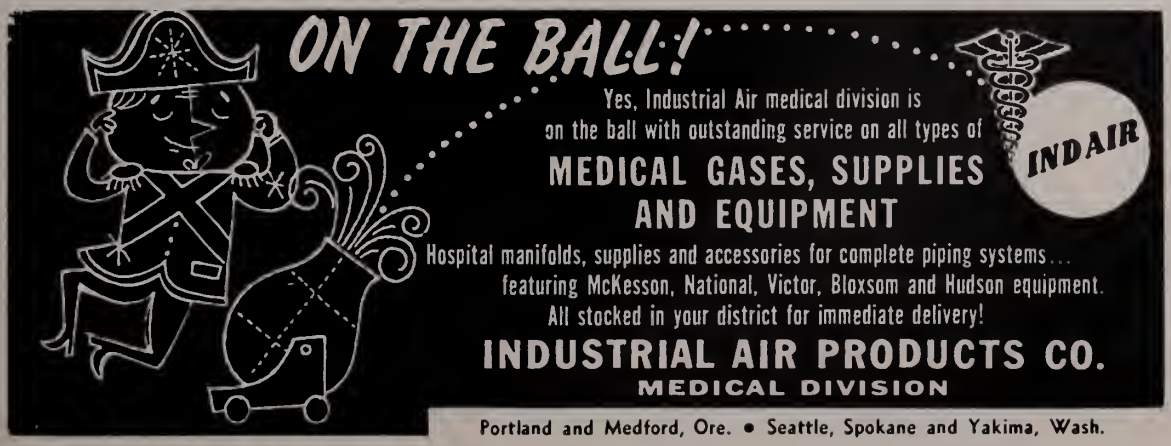
Danowski, M.D., Renziehausen Professor of Research Medicine, University of Pittsburgh School of Medicine; Senior Staff Physician at Presbyterian-Woman's, Children's, Elizabeth Steel Magee, and Shadyside Hospitals of Pittsburgh; Consultant in Metabolism, Oakland Veteran's Administration Hospital, Pittsburgh. 177 pp. Price $3.50. Coward-McCann, Inc., New York. 1958.

REVIEWS

Books reviewed in the columns of Northwest Medicine may be borrowed by any subscriber. Write Miss Ruth Harlamert, Librarian, King County Medical Society Library, Room 121, Cobb Bldg., Seattle 1, Wn. The library appreciates, but does not demand, reimbursement for postage.

PSYCHIATRY AND THE CRIMINAL: A GUIDE TO PSYCHIATRIC EXAMINATIONS FOR THE CRIMINAL COURTS. By John M. MacDonald, M.D., Assistant Professor of Psychiatry, University of Colorado School of Medicine. 227 pp. Price $5.50. Charles C Thomas, Springfield, Ill. 1957.



This book is reminiscent of the synopsis books that were so helpful before examinations in medical school. Essential facts are condensed; important things to remember are clearly and concisely stated. It is a kind of do-it-yourself book that could have been subtitled "How to be an Expert Psychiatric Witness." But it would do the author an injustice to leave the impression that this is his intent. Here is a brief but excellent presentation on the origins of crime, the character of the criminal, the complex factors in the attitude toward punishment, and the problem of stalemating prejudices that keep lawyers and psychiatrists from effective collaboration. The stimulating bibliography alone would inspire the interested reader to a do-it-yourself further inquiry into this challenging field.

Roger C. Hendricks, M.D.

THE RELATION OF PSYCHIATRY TO PHARMACOLOGY. By Abraham Wikler, M.D., Lexington, Kentucky. 322 pp. Price $4.00. The Williams and Wilkins Co., Baltimore. 1957.

Psychiatrists who look over this book will exclaim, "My God! What hath these pharmacologists wrought!" Pharmacologists who look over this book will exclaim, "My God! These psychiatrists are demolishing the science of pharmacology!" What Wikler does is to take a good look at the offspring of this misalliance. Practical evidence of the heartiness of the offspring and its portentous future is seen on every hand with the use of tranquilizer drugs for the anxious and hyperactive patient and the imminent psychic energizers for the apathetic and depressed patient. Important as these practical effects are, the revolution in thinking about mental illness is perhaps more fundamental. The general concept of a biochemical defect as the basic etiology in psychosis has been a stimulating and provocative hypothesis. Wikler's book is the first definitive

(Continued on page 542)

"See what CITRA H.F. capsules do for hay fever—she can now handle ragweed without fear"

NEW CITRA H.F. (Hay Fever)

with Broadspectrum Antihistamines PLUS Vasoconstrictor

Hay fever is a very funny subject... in a cartoon! Your hay fever patients take their problem seriously though, and CITRA H.F. is formulated to help them.

One Citra H.F. capsule every four hours helps to relieve such hay fever symptoms as sneezing, itching and congestion. Each Citra H.F. capsule contains:

Broadspectrum Antihistamines...each in ⅓ their usual therapeutic dosage, providing broader coverage and reduced side effects.

- Prophenpyridamine Maleate .....6.25 mg.
- Methapyrilene Hydrochloride .....8.33 mg.
- Pyrilamine Maleate .....8.33 mg.

Vasoconstrictor...to relieve congestion.

- Phenylephrine Hydrochloride .....10.0 mg.

THE CITRA FAMILY NOW INCLUDES:

New CITRA H.F.... for fast relief from hay fever symptoms.
CITRA FORTE (SYRUP)... for immediate cough control.
CITRA CAPSULES... for optimum relief of cold symptoms at any stage.
CITRA COUGH SYRUP... for relief of minor coughs and cold symptoms.

BOYLE & COMPANY Los Angeles 54, California

victims of **fecal frustration**

are effectively treated by

Bidrolar combines a natural laxative with an effective stool softener. It provides effective combination therapy without the use of irritating bowel evacuants and without the disadvantages and lack of peristaltic action noted with the use of stool softeners alone.

Each Bidrolar tablet provides **ox bile,** 60 mg.—a peristaltic stimulant that produces natural laxation without irritating the bowel . . . and **dioctyl sodium sulfosuccinate,** 40 mg.— an effective stool softener that keeps feces soft for easy evacuation.

in fecal frustration **Bidrolar** *is* ***naturally*** *better*

(Continued from page 539)

review of this hypothesis and experimental work which has been done to validate or disprove it. It is, therefore, must reading for scientists in both psychiatry and pharmacology. It is not a book of dogmatic or empirical directions for the treatment of patients by the new miracle drugs. Rather, it is a book for the serious student who wants to see some order and rational systematic organization brought to the chaotic and heterogeneous flood of papers in this field.

James M. Dille, Ph.D., M.D.

AN ATLAS OF THE COMMONER SKIN DISEASES with 153 Plates. Reproduced by Direct Colour Photography from the Living Subject. Ed. 5. By Henry C. G. Semon, M.A., D.M. Oxon., F.R.C.P. London; Consulting Physician for Diseases of the Skin; Ex-President and Vice-President, Dermatological Section, Royal Society of Medicine. Revised with the Collaboration of Harold T. H. Wilson, M.A., M.D. Cantab., M.R.C.P., D.T.M., Dermatologist and Lecturer to Postgraduates, Royal Northern and Central Middlesex Hospitals. Colour Photography originally directed by the late Arnold Moritz, B.A., M.B., B.C. Cantab. 375 pp. Price $20.00. The Williams and Wilkins Company, Baltimore. 1957.

The fifth edition of this Atlas by English authors presents 153 excellent color plates of most of the more common dermatoses. Excellent paper has helped to make reproductions of the diseases very good. Only in a few instances have the authors strayed from the intent of the text by inclusion of rare disorders.

In the new edition as well as previous printings, the authors have made no attempt to classify dermatologic disease; the various entities are presented in alphabetical order. In this regard, some confusion results as the English background of the authors is manifest by variation in nomenclature from that of American.

Many common features of the disorders are well covered in a concise manner in the text material. However, as in past editions, space is wasted recounting details of the cases presented in the colored plates. Finally, the attempts to give therapy of each entity are weak. Much of the therapy is in need of modernization.

Conciseness of presentation and excellence of illustration are the best features of this presentation to both the student and the physician.

Robert A. Pommerening, M.D.

INTRODUCTION TO ANESTHESIA: PRINCIPLES OF SAFE PRACTICE. By Robert D. Dripps, M.D., Professor and Chairman, Department of Anesthesiology, Schools of Medicine, University of Pennsylvania; James E. Eckenhoff, M.D., Professor of Anesthesiology, Schools of Medicine, University of Pennsylvania; and Leroy D. Vandam, M.D., Clinical Professor of Anesthesia, Harvard Medical School. 266 pp. Line drawings by Leroy D. Vandam, M.D. Price $4.75. W. B. Saunders Co., Philadelphia, 1957.

The authors present an elementary approach to the various aspects of practical anesthesia which appears to represent a distillate of the philosophy of teaching anesthesia at the Hospital of the University of Pennsylvania. Organization of the book is somewhat different than the usual since the sections are divided into the preanesthetic period, the day of anesthesia, during operation, the postoperative period, and some special topics. It seems to be of particular value in providing an approach to anesthesia for the student, intern and neophyte resident. In addition, some more-experienced individuals will find it interesting and stimulating because it highlights the distinctive differences in philosophy espoused by the Pennsylvania group. Succinct descriptions are presented of inhalation, intravenous, spinal and local techniques of anes-

thesia. A number of potential complications are well presented. Special topics include cardiac resuscitation, principles of pediatric anesthesia, anesthesia for outpatients, obstetric anesthesia and infant resuscitation, management of narcotic poisoning, and fundamentals of inhalation therapy. Selected references are suggested at the end of each chapter so that the reader may, if he so desires, explore in more depth the material which is offered here in introductory form.

Lucien E. Morris, M.D.

MODERN SEX LIFE. Rev. Ed. By Edwin W. Hirsch, M.D. 160 pp. Price $.35. Signet Book published by New American Library, New York. 1957.

This is a presentation of the author's concept of sexual dysfunction, which he has gleaned from many years of practice of sexology and urology, and a condensation of two other books, "Modern Sex Life" and "Sex Power in Marriage." He presents sexual relationships in a straight-forward, and at times blunt, manner and many of the concepts presented are healthy and practical. These concepts, however, are interlarded with the author's personal opinions, criticisms, and at times resentful discussions of the psychologic concepts current in medicine concerning the importance of emotional development as related to sexual activities and capacities. He presents an unscientific and biased concept of psychologic principles and at times evidences inadequate knowledge of these matters to discuss them reasonably. These facts detract much from the benefit of the book to those who are seeking instructions or knowledge useful in their sexual adaptation and might even act as a detriment to individuals who are anxious and have emotional problems. For this reason the book cannot be recommended for newsstand distribution or for use as a manual by physicians in discussing sexual adaptation with patients.

William Y. Baker, M.D.

FOOT TROUBLES. By T. T. Stamm, F.R.C.S., 122 pp. Illustrated. Price $4.75. Philosophical Library, Inc., New York. 1957.

This little book is designed to be read by lay personnel and by medical ancillary personnel rather than by the physician or surgeon. The reader will need to have at least some basic medical knowledge which he is able to understand, however. In the ten chapters are discussed: basic foot structure, common foot disorders. differential diagnosis of foot pains, and choice of foot wear. A description of foot exercises and a very brief discussion of other conditions affecting the foot are presented also.

The author takes a common-sense viewpoint in his various discussions, and covers many subjects in a superficial manner. Treatment is mentioned in a general manner.

The practitioner would benefit by reading this, in getting a bird's-eye view of normal foot disabilities.

J. Irving Tuell, M.D.

PRACTICAL CLINICAL CHEMISTRY: A GUIDE FOR TECHNICIANS. By Alma Hiller, Ph.D., Associate Attending Biochemist in Charge of Clinical Chemistry, The Presbyterian Hospital of the City of Chicago; Associate Professor of Biological Chemistry, University of Illinois College of Medicine, Chicago, Ill. 265 pp. Price $6.50. Charles C Thomas, Springfield, Ill. 1957.

This book is essentially a laboratory manual giving one procedure for performing each of a number of

complete protection

To build sound bones and teeth, and to promote body resistance to disease, infants need sufficient quantity of vitamins A, C and D. When you prescribe Special Morning Milk and orange juice, or another source of ascorbic acid, vitamin requirements are normally met. Among all brands of evaporated milk, *only* Special Morning Milk is fortified with both vitamins A *and* D (2,000 U.S.P. units vitamin A and 400 U.S.P. units vitamin D per reconstituted quart).

"Exclusively for the treatment of Alcoholism"

(Continued from page 545)

determinations. There is a 12-page introductory chapter on General Laboratory Procedures, an 11-page chapter on Standard Solutions of Acid and Alkali, and a 9-page chapter on Photometry. The next 161 pages contain 26 chapters, each one carefully describing the determination of one of 20 substances in one or more types of specimen. Each chapter has sections on reagents, procedure, and calculation as well as a final outline for the determination. The outlines are reprinted in the back of the book as a separate group of perforated pages which may be removed for ready reference.

In general, the methods given are well chosen, although the originators of the methods are seldom identified and only a few general references are given for each determination. The procedures have been made as simple and fool-proof as is practicable. In this second edition, improvements and simplifications have been made in the determinations of bromsulfalein, cholesterol, icteric index, sugar, nonprotein nitrogen and uric acid.

This is not a textbook, for it contains very little theoretic material and it gives very little on the interpretation of the results. It is, as the sub-title suggests, a guide for technicians.

Lester D. Ellerbrook, Ph.D.

SURGICAL TECHNIQUE AND PRINCIPLES OF OPERATIVE SURGERY. Ed. 6, revised. By A. V. Partipilo, M.D., Clinical Professor of Surgery, The Stritch School of Medicine of Loyola University. Foreword by Alton Oschsner, M.D., William Henderson Professor and Director of the Department of Surgery, The Tulane University School of Medicine, New Orleans, Louisiana. 966 pp. 719 Figures containing 1235 Illustrations. Original Illustrations by W. C. Shepard and Hooker Goodwin. Price $20.00. Lea & Febiger, Philadelphia. 1957.

This is the sixth edition of a well-established text. The material recorded in the previous edition has been revised extensively and 38 new chapters have been added to cover the newer developments which have been brought within the realm of the surgeon. An amazing amount of material is presented in this one volume and it is exceptionally well organized.

Each chapter is concise and devoted to a specific topic. This makes the reading easier for the student and makes the book more valuable for a quick review of a specific problem. Although the title of the book is "Surgical Technique," each chapter also contains a pertinent review of anatomy, physiology and pathology as well as the clinical indications, contraindications and pre and postoperative care.

This book will be a valuable addition to the library of any student of general surgery. It covers in detail all the aspects presently included in that category and summarizes adequately the present concepts of cardiac and thoracic surgery. The authors and publisher are to be congratulated on this fine publication.

David B. Judd, M.D.

AIDS TO BACTERIOLOGY. Ed. 9. By H. W. Scott-Wilson, B.Sc., M.B., M.Ch. (Oxon.), Director of the Laboratories of Pathology and Public Health, London. 403 pp. Price $3.50. Bailliére, Tindall and Cox, London. 1957. Distributed by Williams and Wilkins Co., Baltimore.

This is one of some 48 books written by various English authors which together constitute what is called the Student's Aid Series. The material is well organized and carefully presented using a minimum of words. It is not a reference book, and yet contains pretty much everything desired in a condensed form. The book has been prepared for students attempting a review of the subject of bacteriology or preparing for an examination. As such it has fulfilled its job admirably. As a reference book for doctors using a medical library, it would definitely fall short.

C. L. Hoff, M.D.

A TEXTBOOK OF CLINICAL NEUROLOGY; WITH AN INTRODUCTION TO THE HISTORY OF NEUROLOGY. Ed. 8. By Israel S. Wechsler, M.D., Consulting Neurologist, The Mount Sinai Hospital, New York. 782 pp. Illustrated. Price $11.00. W. B. Saunders Co., Philadelphia. 1958.

Dr. Wechsler's text has earned a justifiable reputation for its accurate descriptions of clinical signs and symptoms of neurologic diseases, and the present edition maintains this quality. During the 30 years since this textbook first appeared, major advances have been made in understanding the basic physiology and biochemistry of neurologic and muscular diseases. It is disappointing that relatively little attention is given in this text to this newly acquired basic knowledge. Discussions, for example, of the pathogenesis of illnesses, such as myasthenia gravis or Wilson's Disease, are extremely limited and fail to include well-known experimental data, the knowledge of which is integral to the administration of rational treatment. Similarly, the static pathology rather than the kinetic physiologic is given most emphasis in the sections on vascular disease and there is no mention of the concepts of cerebral vascular insufficiency or of the potential uses of anticoagulant drugs in treatment. Omissions of this magnitude place serious limitations on the volume as a summary of current knowledge in the field of clinical neurology.

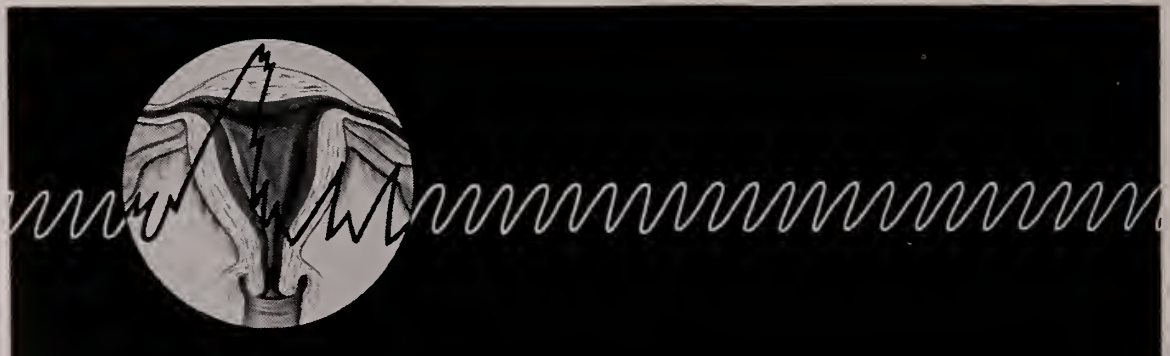
Fred Plum, M.D.

CIBA FOUNDATION COLLOQUIA ON ENDOCRINOLOGY: Vol. II, Hormones in Blood, Edited by G. E. W. Wolstenholme, O.B.E., M.A., M.B., B.Ch., and Elaine C. P. Millar, A.H.-W.C., A.R.I.C. 416 pp. 74 illustrations. Price $9.00. Little, Brown and Company, Boston. 1957.

The Ciba Foundation (financed by, but otherwise independent of, the pharmaceutical concern), undertakes many activities "for the Promotion of International Cooperation in Medical and Chemical Research." This fine volume presents the 21 original papers of a colloquium held in London in February 1957, plus a transcription of the comments evoked from the 35 first-rank investigators attending. The reader first concentrates on the solid facts and guarded conclusions of a research article and then he is entertained and his understanding is broadened by the ensuing free-for-all discussion.

Hormones, by definition, are secretions carried in the blood, but their measurement there, although logical, has been technically unsatisfactory until recently. This volume, however, conforming remarkably well to its title, presents data on blood levels of nearly every internal secretion. Basic research is the central theme but clinical applications and implications are apparent throughout.

This is a superb book which will be of great value to anyone interested in any aspect of endocrinology. Others will find that their association of the endocrinologist with a 24 hour urine collection may soon be passe.



Neil J. Elgee, M.D.

THE HANGOVER: A CRITICAL STUDY IN PSYCHODYNAMICS OF ALCOHOLISM. By Benjamin Karpman, M.D., Chief Psychotherapist, St. Elizabeths Hospital, Washington, D.C. 531 pp. Illustrated. Price $9.50. Charles C Thomas, Springfield, Ill. 1957.

Certainly before alcoholism can ever be understood, it will be necessary for researchers to understand the symptoms of alcoholism as they are evidenced overtly by alcoholics. Dr. Karpman has made an extensive study of 14 patients, both men and women, in an effort to understand the psychodynamics of their hangovers. In so doing, he has com-

Hospital practice of infant feeding

Standard formulas for PREMATURES

Breast milk is satisfactory for the feeding of prematures in spite of the low protein and mineral and high fat content. But eventual formula feeding should provide a high protein and carbohydrate to satisfy the rapid-growing needs of the premature and low fat content because of limited digestive capacity.

Feedings of small prematures are most effectively administered by the indwelling polythene nasal catheter and of large prematures, by bottle with small nipples.

The first six feedings should be a sterile 5% solution of Karo Syrup at 2 to 3 hour intervals; for subsequent feedings, breast milk or formula should be added in gradually increasing amounts according to tolerance and requirements, as indicated in the table below.

Initial feeding schedules for premature infants

(Feedings Started After 36 Hours and Continued at 2 to 3 Hour Intervals)

FEEDINGS	COMPOSITION	QUANTITY
First Six	5% Karo	2-5 ml.
7th and 8th	2 parts 5% Karo 1 part breast milk or formula	6-10 ml.
9th and 10th	1 part 5% Karo 1 part breast milk or formula	8-15 ml.
11th and 12th	1 part 5% Karo 2 parts breast milk or formula	10-18 ml.
Subsequently	Breast or formula feeding	12-20 ml.

ADVANTAGES OF KARO® IN INFANT FEEDING

Composition: Karo is a superior maltose-dextrin mixture because the dextrins are non-fermentable and the maltose is rapidly transformed into dextrose which requires no further digestion.

Concentration: Volume for volume Karo furnishes twice as many calories as similar milk modifiers in powdered form.

Purity: Karo is processed at sterilizing temperatures, sealed for complete hygienic protection and devoid of pathogenic organisms.

Low Cost: Karo costs 1/5th as much as expensive milk modifiers and is available at all food stores.

(Continued from page 548)

piled a vast amount of data that will be of great value to other researchers who will follow with studies on this subject. He is to be commended for studying this phase of alcoholism.

The author does fail to explain any causation of alcoholism other than his statement that "alcoholism will never be solved except in psychological terms." I do not find that the author has supported his position in this thinking, with the exception of showing the emotional involvement of his 14 subjects. Part of the emotions displayed by his subjects might well have been the effect of alcoholism rather than the neurotic causes, as the author suggests. Certainly Dr. Karpman is somewhat at odds with other researchers in the field when he applies a singular etiology to alcoholism. Present material available in research literature on alcoholism tends to support the idea of multiple etiology.

Later on, Dr. Karpman suggests that the "chronic alcoholic is invariably the victim of neurosis first and of alcohol second." He states that there is no such thing as the 'alcoholic cure,' but is pleased to report that stubborn cases of alcoholism have been cured by psychotherapy.

The author's implication that alcoholism is secondary to neurosis is a broad generalization hardly supported by 14 case studies. If this were true, alcoholics freed of their neurosis could drink in a controlled manner. It is generally accepted by all workers in the field that no true alcoholic can ever return to controlled drinking.

It is my opinion that all alcoholism does not of necessity develop from neurosis and that great care should be taken in preventing the application of any sweeping generalization to this extremely complicated and difficult disease.

Paul O'Hollaren, M.D.

BONE TUMORS: GENERAL ASPECTS AND AN ANALYSIS OF 2,276 CASES. By David C. Dahlin, M.D., Associate Professor of Pathology, Mayo Foundation, Rochester, Minnesota. 224 pp. Illustrated. Price $11.50. Charles C Thomas, Springfield, Ill. 1957.

This book is a concise outline of bone tumors, benign and malignant, as observed at the Mayo Clinic. In the interest of brevity, the author has used to advantage tables of classification, charts on age and skeletal distribution. The photos of roentgenologic evidence and photomicrographs demonstrate the classic pathologic entities. With this approach one could hardly say that differences of opinion would produce controversy. The bibliography at the end of the 24 chapters contains pertinent references. It is an excellent book for teaching.

Howard L. Richardson, M.D.

INTRODUCTION TO CLINICAL ENDOCRINOLOGY. By A. Stuart Mason, M.D., B.Ch. (Cantab.), M.R.C.S. (Eng.), M.R.C.P. (Lond.), Senior Lecturer, Medical Unit, The London Hospital; Consultant Physician, Department of Endocrinology, New End Hospital, Hampstead; Physician in Charge, Diabetic and Endocrine Unit, Oldchurch Hospital, Romford, Essex. 192 pp. Price $4.50. Charles C Thomas, Springfield, Ill. 1957.

This book is an introduction to endocrinology written primarily for the medical student or recent graduate. The author has attempted to present clinical endocrinology in terms of applied physiology. The book contains no illustrations. In aiming at coherence and simplicity he has sacrificed full discussion of alternative views and omitted references to the literature. A concise account of endocrine diseases as well as tests for investigating endocrine dysfunction are clearly outlined. This book can be recommended for the beginner in the endocrine field but not for the specialist.

PRACTITIONERS CONFERENCES. Held at the New York Hospital-Cornell Medical Center, Vol. 6. Edited by Claude E. Forkner, M.D., Professor of Clinical Medicine, Cornell University Medical College. 378 pp. Illustrated. Price $6.75. Appleton-Century-Crofts, Inc. New York. 1957.

This volume details the blow-by-blow accounts of panel discussions on 15 widely varied subjects, including trichinosis; cancer of the thyroid, prostate, esophagus, lung and bone; dermatophytosis; poison ivy; endometriosis and gout. It is more a reference library book than a book for an individual to covet.

Professor Forkner, the editor and moderator of the panel, is able to keep each panel on the track without intruding. A perusal of this volume would be of value to anyone who is assigned to a panel on any topic. Each subject is handled well, but I personally prefer to read straight narration rather than drama script style that is required in reporting a conference.

It is unfortunate that the reader is not given an opportunity to see the slides that are mentioned repeatedly. It is rather frustrating to read about them and not see them.

This, then, is a reference book that would be of value as such.

Bernard P. Harpole, M.D.

HOSPITAL ACCREDITATION REFERENCES. 136 pp. Price $3.25. American Hospital Association, Chicago. 1957.

This 132 page reference booklet summarizes the essential elements of the five publications of the Joint Commission on Accreditation of Hospitals. These consist of the "Standards for Hospital Accreditation," the "Bulletin of the Joint Commission on Accreditation of Hospitals," the "Survey Report" forms, the "Model Medical Staff Bylaws, Rules and Regulations," the "Bylaws of the Joint Commission on Accreditation of Hospitals," and selections from the correspondence of the Commission, which serves as effective interpretive material for the questions which arise most frequently.

This manual, used as a reference by hospital administrators, trustees, heads of services, and committees, should help greatly in explaining the very worth-while but often misunderstood goals of the Joint Commission.

Rodney B. Hearne, M.D.

THE SPINE JACK OPERATION FOR SCOLIOSIS. By H. Leslie Wenger, M.D. 86 pp. Illustrated. Complimentary. Published by Dr. H. Leslie Wenger, 44 Gramercy Park North, New York 10, N.Y. 1957.

The author briefly mentions various types of treatment used in the care of curvature of the spine (scoliosis). He mentions a supposedly widespread pessimism for these methods.

The spine jack operation is described. It seems obviously to be used in single curves. A long paravertebral incision is made on the concave side. Two inches is excised from each of several ribs. The transverse processes are excised and the intercostal bundles ligated and divided. An attempt is made to reflect the parietal pleura intact. The intercostal arteries are usually ligated near the aorta. Heavy screws are turned into a vertebral body above and one below. In young children the screw may be placed into the intervertebral disc if the vertebral body is soft. A turnbuckle of metal is attached at each end of the screws by a cup-shaped housing, permitting rotation movement only. The turnbuckle is screwed open to lengthen it and attached by a cotter pin. X-ray re-check is made. The chest is closed with draniage for a few days. The apparatus is left in.

Fifteen case reports are given. The longest case under treatment was four years. Numerous radiographs are presented. Complications are discussed.

A mortality of 3 patients in 49 operations (18 of these were spine jack cases) is mentioned. The radiograms show variable but considerable decrease in the curves.

The procedure and the method of treatment for structural scoliosis, appears to be formidable and heroic. The mortality rate alone would make its use or choice uncommon as a substitute for the Risser localizer plaster and spinal fusion method. The knowledge accumulated regarding all phases of scoliosis is extensive. If the patient appears early, if he is studied and photographed, and if various x-ray studies—including standing views—are recorded and preserved for periodic comparisons, serious increase will be detected in time. Plaster can usually be used with the patient ambulatory. In place of being in the hospital for one year as the author states, most patients are able to be ambulatory in about one week after each stage of fusion, and to leave the hospital soon thereafter.

Therefore, the advantages for the spine jack operation do not justify the risk.

D. G. Leavitt, M.D.

THE NEUROSES AND THEIR TREATMENT. Edited by Edward Podolsky, M.D., Brooklyn, New York. 555 pp. Price $10.00. Philosophical Library, New York. 1958.

The reader of this book will be somewhat surprised not to find it a textbook in the accepted sense, as the title suggests, but rather a compilation of recent papers on the vast subject of neuroses.

The areas covered range from anxiety in infants to emotional problems of the adult, from pharmacotherapy to psychosurgery, and from psychoanalysis to other psychotherapeutic methods of treating the minor emotional illnesses. Several of the papers included in this text are merely reports on extensive research.

Due to the many contributors to this volume there is some unavoidable repetition of subject matter but this does not detract from the value of this collection; on the contrary, it affords the reader the latest specific knowledge as well as a variety of views on current psychiatric problems. It is really remarkable what wealth of material is discussed under 37 headings. The editor endeavored to bring into focus with his choice of articles—and he was eminently successful in his effort—a representative cross-section of today's thoughts on the treatment of neuroses. No doubt this book will be a definite and worth-while asset to any medical or psychiatric library.

Irwin Wirth, M.D.

TUMOR SURGERY OF HEAD AND NECK. By Robert S. Pollack, M.D., Clinical Instructor in Surgery, Stanford University School of Medicine; Clinical Instructor in Surgery (Oncology), University of California School of Medicine. 101 pp. 49 illustrations. Lea & Febiger, Philadelphia. 1957.

The purpose and scope of this book are well described in the author's own introduction. He refers to this 94 page volume as one which deals primarily with the art of head and neck surgery, since it describes only the anatomy and the technique of surgery of tumors of the head and neck. His purpose is well executed. The author assumes that those interested in this field are familiar with the basic concepts of tumor surgery, the anatomy and physiology of the head and neck, and also the pathology of the lesions described. He merely outlines his rationale and technique in the performance of the surgical treatment of such tumors.

Without attempting to resolve certain controversies that exist in the treatment of some of the tumors in this region, the author describes not only the common lesions of the oral cavity, lip and tongue, but also includes the treatment of tumors of the salivary glands, thyroid gland, and paranasal sinuses. The indications for hemimandiblectomy and radical neck dissections are concisely presented, although perhaps

(Continued from page 555)

somewhat dogmatically. Nonetheless, the reader is left with a feeling of security in that a definite stand has been taken and accurate description of the technique has been presented. Good diagramatic illustrations accompany the text. A separate chapter deals with the old problem of the role of radiation therapy in the treatment of these tumors. I felt that this section was especially appropriate and well written.

This book is an excellent volume for the general surgeon who does surgery of the regions under discussion.

Sherman W. Day, M.D.

FUNDAMENTALS OF ELECTROCARDIOGRAPHY AND VECTORCARDIOGRAPHY. By Lawrence E. Lamb, M.D., Director of Cardiology and Chief, Department of Internal Medicine, Air University School of Aviation Medicine, USAF, Randolph Air Forco Base, Texas. 142 pp. Illustrated. Price $9.50. Charles C Thomas, Springfield, Ill. 1957.

Having attended a series of lectures recently on vectorcardiography, I was very much interested in reviewing this book. Although only 138 pages in length, I found it very time-consuming but I have been amply rewarded; in fact, sufficiently so to order a copy, partly to add a book of quality to my library and partly because it is a book that will be useful for reference and review while interpreting electrocardiograms.

I am convinced that the vector principles are basic to the science of electrocardiography just as the other basic sciences are to the various fields of clinical medicine. However, one may read electrocardiograms with considerable success without a background knowledge of vector principles just as one may recognize and interpret a photograph without a knowledge of the science of optics. Because an important part of clinical electrocardiography has to do with disorders of rhythm and because electrocardiographic patterns of myocardial infarction can be learned easily in a short time, I would reserve this book for the clinician who has an unusual interest in the subject and not for those whose interest is more general.

Robert F. Foster, M.D.

THE POSTOPERATIVE CHEST: RADIOGRAPHIC CONSIDERATIONS AFTER THORACIC SURGERY—Publication II in The John Alexander Monograph Series on Various Phases of Thoracic Surgery. By Hiram T. Langston, M.D., Clinical Associate Professor of Surgery, University of Illinois College of Medicine; Anton M. Pantone, M.D., Clinical Assistant Professor of Radiology, University of Illinois College of Medicine; and Myron Melamed, M.D., Clinical Assistant Professor of Radiology, University of Illinois College of Medicine. 228 pp. Illustrated. Price $8.00. Charles C Thomas, Springfield, Ill. 1958.

This second publication in the John Alexander Commemorative Series covers the problems of interpretation of the changes arising in the postresection chest. The temporal relationships and follow-up are properly woven into the interpretive paragraphs. A long and excellent section on the anatomic rearrangement of lobes and segments following various intrathoracic procedures is included, and its presence encourages accurate anatomic evaluation of postoperative changes, a matter of utmost importance in the management of these patients.

Here, as in most attempts at reproduction of radiographs, the film cannot be printed in sufficient detail to satisfy the analytic observer. Frequently the line drawings bring out changes impossible to see in the film as it is reproduced. Perhaps more space devoted to the film itself and less to the line drawing would have minimized this problem. A further objec-

LIVERMORE SANITARIUM

This facility provides an informal atmosphere seldom found in hospitals elsewhere. A sound and scientific approach to emotional problems is provided with careful deliberation, with the patients' best interests given every consideration. Our approach is eclectic with emphasis along the lines of dynamic and psychobiologic psychiatry. Every recent therapy is available.

Individual services are amply provided for; in individual cottages if desired, so that the patient's every need is considered.

All diagnostic and ancillary consultative services are available.

Information upon request.
Address: HERBERT E. HARMS, M.D.

tion is the lack of consistency in symbols used for air and fluid in the line drawings.

It is hard for me to see exactly to whom this monograph is directed. Reproduction of the films cannot be made in sufficient detail to satisfy the surgeon doing tuberculosis resection surgery regularly and those who are not so involved will rarely find need for such a publication. Perhaps its greatest benefit is to reassure the thoracic surgeon that he is not the only one with troublesome postoperative problems.

Robert C. Coe, M.D.

HUMAN BIOCHEMISTRY. Ed 5. By Israel S. Kleiner, Ph.D., Professor, and Director of the Department of Biochemistry, New York Medical College, and James M. Orten, Ph.D., Professor of Physiological Chemistry, Wayne State University College of Medicine, Detroit, Michigan. 808 pp. 94 Text Illustrations and 5 Color Plates. The C. V. Mosby Company, St. Louis. 1958.

I am not quite clear as to the function of books such as this. In the olden times when I taught chemistry, publishers hopefully flooded me with texts on General Science, and Household Chemistry. One of the former had a discussion of electric toasters. It said there are two kinds of electric toasters, "vertical," and "horizontal;" and it gave pictures of each. That was all.

This book is filled with similarly interesting information. You will learn that glycerine has many uses in industry; and that when treated with nitric acid it forms nitroglycerine (formula given) which explodes and dilates bloodvessels.

You will leran that floating soap floats because they put air in it, and that soap does not lather well in hard water, at least till it has precipitated the calcium and magnesium.

You will learn that dairy milk is of uniform quality because it comes from many cows; that most mothers can nurse their children adequately; that young mothers secrete more milk than old ones because they are younger; that the residue from churning is called "buttermilk;" that lactalbumin and lactoglobulin are "typical albumin and globulin, respectively;" and that a soft curd is "undoubtedly" more easily digested than a hard curd. (No reason or evidence for the last statement, or for dozens of similar statements, is given.)

You will learn there is something called a "sedimentation rate" which may be elevated, especially in septicemia and tuberculosis, and is best reported as "normal," "fast," "very fast," or "slow;" and it is probably increased by cholesterol and its esters and decreased by phospholipids.

You will meet a lot of "scienitfic" terms, names, and formulas with which you mav or may not be already familiar, but which you will know no more about for having met them. You will not need to bother about energy relations, or any kind of mathematics; or even feel that you have to understand anything. You could not if you tried.

All in all, this book might best be described as a painless short-cut to wisdom, and can be recommended to all who are interested in such.

Frederick B. Exner, M.D.

PSYCHIATRY IN THEORY AND PRACTICE. By Beulah Chamberlain Bosselman, M.D., Professor of Psychiatry, College of Medicine, University of Illinois, Chicago. 150 pp. Price $4.00. Charles C Thomas, Springfield, Ill. 1957.

As a student I was impressed by Dr. Bosselman. I have also been impressed by her book. It is concise, clearly written, and relatively free of jargon. This book is based on a series of tape recorded lectures given to the first year residents at the University of Illinois Neuropsychiatric Institute. To cover the major theories of Freudian psychiatry in the space of 140 text pages and to keep the writing interesting

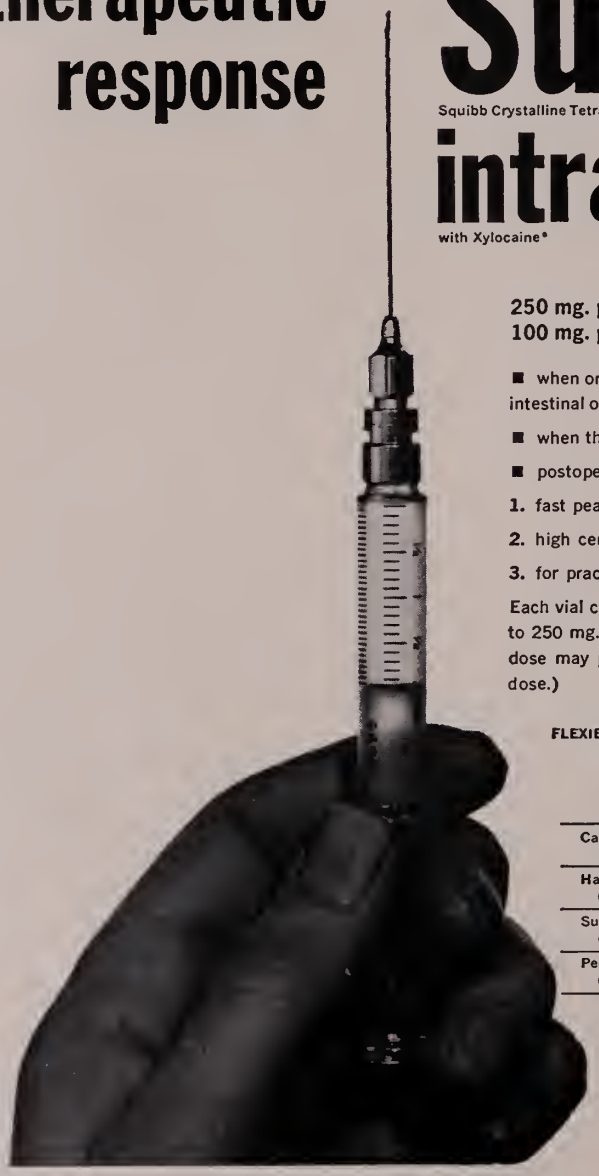
immediate therapeutic response



use

Sumycin

Squibb Crystalline Tetracycline Phosphate Complex

intramuscular

with Xylocaine*

250 mg. per 1 dose vial
100 mg. per 1 dose vial

- when oral therapy is contraindicated (vomiting, dysphagia, intestinal obstruction, gastrointestinal disorders)
- when the patient is comatose or in shock
- postoperatively

1. fast peak blood and tissue concentrations
2. high cerebrospinal levels
3. for practical purposes, Sumycin is sodium-free

Each vial contains tetracycline phosphate complex equivalent to 250 mg., or 100 mg., of tetracycline HCl. (Note: 250 mg. dose may produce more local discomfort than the 100 mg. dose.)

FLEXIBLE DOSAGE FORMS FOR CONTINUING ORAL THERAPY

	Tetracycline phosphate complex equiv. tetracycline HCl (mg.)	Packaging
Capsules (per capsule)	250	Bottles of 16 and 100
Half Strength Capsules (per capsule)	125	Bottles of 16 and 100
Suspension (per 5 cc. teaspoonful)	125	60 cc. bottles
Pediatric Drops (per cc.—20 drops)	100	10 cc. bottles with dropper

SQUIBB

Squibb Quality—the Priceless Ingredient

SUMYCIN® IS A SQUIBB TRADEMARK ®T.M.® ASTRA PHARMACEUTICAL PRODUCTS, INC.

(Continued from page 557)

requires a good deal of skill. Students should find this of great help in revealing in a short time the basic theories. I doubt that anyone in general practice will find this really helpful in administering to his patients. Anyone whose interests lie in this direction will find this book occasionally provocative and well worth the modest price.

Robert H. Tinker, M.D.

CIBA FOUNDATION SYMPOSIUM ON THE CHEMISTRY AND BIOLOGY OF PURINES. Edited by G. E. W. Wolstenholme, O.B.E., M.A., M.B., B.Ch.; and Cecilia M. O'Connor, B.Sc. 327 pp. Illustrated. Price $9.00. Little, Brown and Company, Boston. 1957.

There is more than philosophic evidence to support the concept, increasingly popular in the past few years, that the key to an integrated understanding of a number of additions to biologic knowledge, which seem at first to be unrelated, (e.g., chemical inhibition of malignant growth, antibiosis, carbohydrate metabolsim, etc.) may eventually be found to exist in a further understanding of the chemistry of the pteridine and purine compounds and their relatives. From the clinical standpoint, probably the most startling developments in this field have been those related to the discovery of the anti-mitotic action of certain of the purine inhibitors, or "competitors," (e.g., the anti-leukemic action of 6-mercapto-purine), the early studies on puromycin (an antibiotic agent with effective inhibitory action against protozoan and multi-cellular organisms, making it possibly of value in the treatment of amoebiasis, and particularly trypanosomiasis), and the work with vitamin B_{12}, and the four naturally-occurring purine analogues thus-far discovered.

The present volume is composed of the collection of papers presented at the symposium on "The Chemistry and Biology of Purines," held in May 1956, under the sponsorship of the Ciba Foundation. From the standpoint of material presented and discussed, the organization of this conference appears to have directed the combined efforts of the biochemical and synthetic chemical (through as thorough as possible a study of many structurally-related compounds) toward an investigation of the probable interrelationship of the biologic actions of certain of the purine-type compounds, which have recently gained increased general interest.

Matrial incorporated in this volume is of such academic, and highly-technical nature, as to make it laborious and uninteresting reading for the average, busy physician in private practice. It contains no "useful" information for direct application to common problems of diagnosis or therapy. The inferences for relating this information to concepts in diagnostic and therapeutic problems are nonetheless immense; although they must be derived by the reader for himself. At the same time, this technical and academic aspect of this publication certainly make it esential reading for the physiologist or biochemist.

William R. Pace, Jr., M.D.

PHARMACOLOGY AND THERAPEUTICS—Textbook for Students and Practitioners of Medicine and Its Allied Professions. Ed. 3. By Arthur Grollman, Ph.D., M.D., Lecturer in Pharmacology and Toxicology, Medical Branch; Professor and Chairman of Department of Experimental Medicine, Southwestern Medical School, University of Texas. 1046 pp. 192 illustrations. Price $12.50. Lea & Febiger, Philadelphia. 1958.

In the preface to the third edition, Dr. Grollman states that an attempt has been made to "satisfy the experimental pharmacologist whose interest lies in the broad theory of pharmacodynamics, the student who requires a basic course which will permit him to use drugs rationally and effectively, and the empirical practitioner who wishes to keep abreast of developments in therapeutics." The text is organized into sections devoted to drugs which act mainly on specific organ systems. At the end of each chapter all the appropriate preparations included in the United States and British Pharmacopeias are listed with descriptions of each.

This text would seem to be most appropriate for the student who can obtain a lucid and succinct outline of specific drug action and indications. Because of the rapidity with which modern horizons in therapeutics expand, a single moderately sized text cannot be everything. For this reason the practitioner may find specific information he seeks too condensed for anything but quick reference. It is not, then, intended to be nor is it a complete outline of treatment as encountered in general practice. Within these limitations this book is recommended as a basic text on the intelligent use of drugs.

Alvin Katsman, M.D.

New Mexico Doctors Take Stand on Welfare Problem

The New Mexico Medical Society, with a membership of 509 physicians, has been in the middle of a complex and controversial political storm during the last few weeks over the handling of the state's welfare program.

State President Samuel R. Ziegler reports that after long and heated debate and much publicity, the welfare department accepted the society's offer to render free medical care to welfare patients rather than accept a further reduction in payments from the welfare fund. The schedule originally accepted by physicians represented roughly one-fourth of a doctor's usual fee.

The doctors' offer came after the state's department of public welfare claimed that because of a gradual increase in the number of patients the medical pool fund, established in 1952 with state and federal money, was running dry. The fund is used to provide medical surgical, hospital, dental, and nursing care and drugs for welfare patients.

The department of public welfare wanted the doctors to reduce their fees. The doctors said "no" to that plan and, instead, offered to give free medical care. The welfare department agreed to accept the offer which is to be effective from Jan. 31 to June 30 at which time the physicians will meet with welfare department officials and review the experience.

Professional Classified

PRACTICE OPPORTUNITIES

PHYSICIAN FOR INDUSTRIAL INSURANCE

Position available for physician interested in industrial insurance administration. Physical disability acceptable. Please give full detail of previous experience and age. Write Box 48-A, Northwest Medicine, 1309-7th Ave., Seattle, Wash.

OPPORTUNITY FOR GENERAL PRACTITIONER

GP group practice with four other GPs; 30 miles from Seattle. Snoqualmie Valley Clinic, Snoqualmie, Wash. Phone 88-3352.

INTERNIST WANTED

Board eligible internist wanted for private practice associated with established specialists. Suite for lease. Opportunity to share building and laboratory ownership. Prosperous growing Pacific Northwest City. Write Box 44-A, Northwest Medicine, 1309-7th Ave., Seattle, Wash.

GENERAL PRACTICE FOR SALE

Established practice in small town on Oregon Coast for price of equipment only. Token down payment and easy terms. Well-equipped hospital a few blocks from office. Write Box 49-A, Northwest Medicine, 1309-7th Ave., Seattle, Wash.

OPPORTUNITY FOR GP PRACTICE

For Sale: home-office combination in Priest River, Idaho, with office equipped for practice. Essentially unopposed practice. New Hill-Burton Hospital 7 miles. Capt. H. G. Lawson, U. S. Army Hospital, Dugway, Utah, or Mr. Richard Sonntag, Pharmacist, Priest River, Idaho.

OPPORTUNITY FOR GENERAL PRACTITIONER

Physician is needed for a small town and community of 1500 persons. New clinic available July 1958 on advantageous terms. Building of the clinic was supported by 340 families. Hospital within 20 minutes of town. Housing available. Good schools, churches, roads and community facilities. Contact Mr. W. H. Ritchey, Lind, Wash.

GENERAL PRACTICE FOR SALE

Unopposed general practice in small Willamette Valley town grossed $45,000 in 1957. Twelve year old clinic building used for office and residence but suitable for approximately 30-bed nursing home. Floor space of about 5,400 sq. ft. Office equipment included. Year around scenic and recreational area. Price $50,000. Owner leaving to specialize. Write Box 46-A, Northwest Medicine, 1309-7th Ave., Seattle, Wash.

PSYCHIATRIST FOR SEATTLE VA CLINIC

The Veterans Administration Regional Office Mental Hygiene Clinic in Seattle has a vacancy for a full time psychiatrist. The Mental Hygiene program provides for at least three balanced Mental Hygiene teams. It is sponsoring training programs in Clinical Psychology and Psychiatric Social Service. The clinic now has a staff of two psychiatrists, four clinical psychologists and four psychiatric social workers. Highly qualified local consultants are regularly available for the staff. For further information write or visit the Chief of the Clinic or the Chief Medical Officer.

PHYSICIAN NEEDED AT REFORMATORY

Physician for Reformatory at Monroe needed immediately. Responsible for all phases of medical program. Salary $9552-$11,400, depending on qualifications. Full information on request. Contact Washington State Personnel Board, 212 General Administration Building, Olympia, Wash.

LOCATIONS DESIRED

GENERAL SURGEON DESIRES LOCATION

Board qualified by July 1958; age 35; married and family. Trained in bronchoscopy and urological endoscopy. Specialty training in thoracic, vascular, plastic, orthopedic, urologic, and head and neck; experienced in general practice before residency. Desires location—solitary, associate or group. Midwest graduate. Former resident of Pacific Northwest. Write Box 45-A, Northwest Medicine, 1309-7th Ave., Seattle, Wash.

ADMINISTRATOR FOR HOSPITAL OR CLINIC

M.S. Degree in Hospital Administration, B.S. Degree in Business Administration. Married, 39 years old. Experience in 50-bed hospital as administrator-anesthetist 5½ years; 8½ years total administrative experience. Considerable experience in planning, equipping and staffing new hospitals. Prefer combination administrator-anesthesia position of 30- to 50-bed hospital or business manager-anesthetist of clinic. Send inquiries to Box 47-A, Northwest Medicine, 1309-7th Ave., Seattle, Wash.

EQUIPMENT FOR SALE

OFFICE SURGERY EQUIPMENT

Complete office surgery equipment for sale; 15 ma Profex x-ray and all darkroom equipment. Fraction of replacement cost. Write Mrs. Shirey, E. 1111 37th Ave., Spokane 36, Wash.

MEDICAL EQUIPMENT FOR SALE

Like-new medical office equipment, sell all together or separate items. Moving to Hawaii. Contact Mr. Pat Quigley, Spokane Surgical Supply, Spokane, Wash.

PLACEMENT BUREAUS

PHYSICIANS AND SURGEONS REGISTRY

If interested in re-locating, joining a group or in disposing of equipment and practice, contact us. Services strictly confidential. Continental Medical Bureau, 510 West 6th Street, Los Angeles 14, or Pacific Coast Medical Bureau, 703 Market Street, Room 1404, San Francisco 3.

OFFICE SPACE

MEDICAL OFFICE FOR LEASE

New medical office with 800 sq. ft. located at Kenmore near Seattle. Adjoins dental office. Available now. Call EMerson 3-3240 or LAkeview 4-1867, Seattle, Wash.

BUY OR LEASE MEDICAL SPACE

Opportunity to buy or lease in Medical Dental Center, to be built to your specification. Fast growing suburban area in S.E. Southgate district, Portland. Contact Mr. Roy Van Pelt, York Realty, 401 S.E. 81st Avenue, ALpine 4-1774, Portland 15, Oregon.

MEDICAL SPACE FOR LEASE

Excellent opportunity for pediatrician or general practitioner. One unit available in new 4-unit residential Medical-Dental Clinic in Spokane. Share receptionist. Very attractive rental offer to start. Contact Mr. A. K. Sheely, 1319 Old National Bank Bldg., Spokane, Wash.

PHYSICIAN'S OFFICE FOR LEASE

Office for lease in small clinic building located in good suburban district of Seattle. A pediatrician and 2 dentists well-established in building for two years. Have excellent practices. Ample parking. Will offer very low rent until established. Telephone LAkeview 2-6096 or write 4321 East 41st St., Seattle, Wash.

MEDICAL SPACE FOR LEASE

Now available on First Hill in Seattle—1,400 sq. ft. complete with lab, x-ray, examining rooms, 3 private offices. Convenient off-street parking. Contact Mr. Smith, Henry Broderick, Inc., MAin 2-4350, Seattle, Wash.

GOOD REAL ESTATE INVESTMENT

Residence building ideal for two-physician office for sale by owner. Located in Bellevue, Wash., fastest growing community in Northwest. Roman brick, tile roof, plastered, aluminum window sash, tiled sills and apron throughout. Natural birch woodwork, tile bath. Full basement with fireplace, toilet and shower. Sewers, lawn and shrubs. Large lot for parking. Price $45,000. Write Box 50-A, Northwest Medicine, 1309-7th Ave., Seattle, Wash.

OFFICE SUITE IN SUBURBAN SALEM

For rent or lease: recently constructed office suite for one or two physicians. On Highway 99 E. Off-street parking. Adjacent to shopping center. For details, contact G. C. McNeilly, M.D., Silverton, Oregon. Telephone TRinity 3-5353.

Derived from human venous blood

Maximum response to recommended dosages is assured because each production lot—made from venous blood drawn from 3500 male and female donors—has a consistently high level of immune body content.

20 to 1 concentration

Polio Immune Globulin/Cutter is so concentrated that 2.0 cc. contains the antibody equivalent of more than 40 cc. of normal immune serum.

Also recommended for:

• passive immunization against paralytic poliomyelitis • prevention of infectious hepatitis • treatment of agammaglobulinemia and hypogammaglobulinemia • maternal rubella • and as combination therapy with antibiotics in certain other infectious diseases.

Available in 2 cc. and 10 cc. vials.

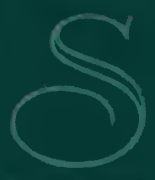
For modification schedule and color enlargement of chart of typical measles course *ask your Cutter man* or write to Dept. 27-D

Polio IMMUNE GLOBULIN

CUTTER Gamma Globulin

Protect against the always present danger of serious complications in unmodified measles.

Used as a measles modifier, Polio Immune Globulin/Cutter allows full active immunity, yet reduces the severity of the attack.



When measles prevention is indicated, Polio Immune Globulin/Cutter confers an effective passive immunity for about 3 to 4 weeks.

CHLOROMYCETIN®

COMBATS MOST CLINICALLY IMPORTANT PATHOGENS

Recent reports comparing the effectiveness of various antibiotics against commonly encountered pathogens indicate that CHLOROMYCETIN (chloramphenicol, Parke-Davis) has maintained its high degree of effectiveness.[1-5] It is still highly active against many strains of staphylococci,[1-8] streptococci,[2,7] pneumococci,[2] and gram-negative[1,2,7,9,10] organisms.

CHLOROMYCETIN is a potent therapeutic agent, and because certain blood dyscrasias have been associated with its administration, it should not be used indiscriminately or for minor infections. Furthermore, as with certain other drugs, adequate blood studies should be made when the patient requires prolonged or intermittent therapy.

RELIEVES THE GNAWING ACHE

Pro-Banthine® provides rapid control of pain in peptic ulcer

In a two-year study[1] by Lichstein and coworkers, documented by intensive personal observation and by follow-up studies, Pro-Banthine (brand of propantheline bromide) often brought immediate relief of ulcer pain. Patients (11 per cent) who did not respond satisfactorily to Pro-Banthine therapy had "anxiety manifestations of psychoneurotic proportions."

In addition to frequent immediate symptomatic relief, Pro-Banthine reduces gastrointestinal motility and diminishes the secretion and acidity of gastric juice, all-important factors in the generation and aggravation of peptic ulcer.

These actions of Pro-Banthine and its demonstrated effectiveness in accelerating ulcer healing[2-5] mark the drug as a most valuable adjunct in the treatment of peptic ulcer.

The suggested initial dosage is one 15-mg. tablet with meals and two tablets at bedtime. An increased dosage may be necessary for severe manifestations and then two or more tablets four times a day may be prescribed.

"Doctors can't help shingles?"

Physicians who have used PROTAMIDE extensively deplore such statements as unfortunate when they appear in the lay press. They have repeatedly observed in their practice quick relief of pain, even in severe cases, shortened duration of lesions, and greatly lowered incidence of postherpetic neuralgia when PROTAMIDE was started promptly. A folio of reprints is available. These papers report on zoster in the elderly—the severely painful cases—patients with extensive lesions. PROTAMIDE users know "shingles" *can* be helped.

"See what CITRA H.F. capsules do for hay fever — she can now handle ragweed without fear"

NEW CITRA H.F. (Hay Fever)

with Broadspectrum Antihistamines PLUS Vasoconstrictor

Hay fever is a very funny subject... in a cartoon! Your hay fever patients take their problem seriously though, and CITRA H.F. is formulated to help them.

One Citra H.F. capsule every four hours helps to relieve such hay fever symptoms as sneezing, itching and congestion. Each Citra H.F. capsule contains:

Broadspectrum Antihistamines...each in ⅓ their usual therapeutic dosage, providing broader coverage and reduced side effects.

- Prophenpyridamine Maleate ..... 6.25 mg.
- Methapyrilene Hydrochloride ..... 8.33 mg.
- Pyrilamine Maleate ..... 8.33 mg.

Vasoconstrictor...to relieve congestion.

- Phenylephrine Hydrochloride ..... 10.0 mg.

THE CITRA FAMILY NOW INCLUDES:

New CITRA H.F. ... for fast relief from hay fever symptoms.
CITRA FORTÉ (SYRUP) ... for immediate cough control.
CITRA CAPSULES ... for optimum relief of cold symptoms at any stage.
CITRA COUGH SYRUP ... for relief of minor coughs and cold symptoms.

SANDOZ

CORRESPONDENCE

Correction Noted in CPC

Seattle, Washington

EDITOR, NORTHWEST MEDICINE:

In the clinical pathologic conference article on Fatty Metamorphosis of Liver in Pregnancy, which was published in the April 1958 issue of NORTHWEST MEDICINE, it was erroneously stated that John Codling was the attending physician. The undersigned served as consultant and lent a helping hand in cut-downs and transfusions.

Because of his first hand knowledge of the case, he was asked to discuss it at CPC.

Respectfully,
John W. Codling, M.D.

Pathology and Monopoly

Portland, Oregon

EDITOR, NORTHWEST MEDICINE:

Unfortunately, the position of the pathologist in a hospital practice is occasionally construed as a monopoly. This concept apparently arises through the essential geographic attachment of the practitioner and the hospital which establishes the institution as "his." Ordinarily no onus need be implied in such a relationship since the qualities of loyalty, intensity of interest, and competitive progress are engendered thereby. The idea becomes disruptive, however, when the pathologist's colleagues unthinkingly view this pattern as monopolistic. This leads to an unwitting alignment with the "hire-the-physician" movement as a means of "controlling" this tendency. It further permits league with certain hospital administrative forces who are distinctly interested in formulating nasty by-words such as "monopolistic practices." This unwelcome accolade is undeserved in hospital pathology where the pathologist has actual charge, and for the following valid reasons.

Perhaps no specialty group compares to pathology in the degree of consciousness of the stifling effects of true monopolistic practices. Almost invariably, for example, the following (or similar) statement appears in the con-

(Continued on page 586)

"... no better place for SPECIALIZATION"

Why do so many specialists locate in the Medical-Dental Building? Well, first of all this location means fine facilities, prestige and convenience. Then too, since this is the largest single medical dental community under one roof in the state; locating here greatly increases the opportunity for referred work. All in all, it's a combination that's hard to beat.

Medical Dental Building

SEATTLE, MAin 2-4984 • METROPOLITAN BUILDING CORPORATION, MGRS.

(Continued from page 585)

tractual note between a pathologist and a hospital: (quote) "Doctor shall permit any member of the medical staff possessed of staff privileges in pathology to practice his profession in the pathology department—." This statement is no different than the regulations obtaining in any other major division in hospital practice and has added notes of guarantees that the quality of service by the attending pathologist be in line with current regulations. Pertinent also is the recommendation emanating as an action of the Executive Committee of the Oregon Pathologists Association: (quote) "It is recommended that a courtesy consultative pathologic service for hospitals be officially acknowledged whereby pathologists unrelated by staff appointment have an open invitation in any hospital to attend any patient for whom his services are requested by the patient or by the patient's personal physician. It is further recommended that no fee be imposed for this specific type of consultative courtesy." This last recommendation is engendered by the fact that a routine charge is ordinarily made by the pathologist or hospital and an additional consultative fee would be duplication.

In actual operation, any monopolistic tendency is less conspicuous in the Portland area than might be implied by the regulatory attention it gets. In one major hospital, for example, the activities pertinent to the monopoly point in question run about as follows: daily problem sessions on both anatomic and clinical material by four very independent staff-related pathologists and equally independent residents; weekly interinstitutional SOB-slide meeting at the medical school attended by representatives of at least six hospitals; weekly orthopedic slide consultation at the registry; 36 (in 1957) mailed consultations to national registries or authorities; over 100 personal visits by non-staff-related pathologists to the hospital for consultation; almost continuous daily slide exchanges in the immediate area; and regional and national reviews which serve as excellent consultative media. In these multitudinous interchanges no fee was ever levied beyond the routine charge and the patient and attending physician were assured through consultative devices of the most authoritative possible opinion on a national level. It is difficult to conceive of a less monopolistic practice nor one less adapted to monopolistic procedures.

Apart from hospital dominance and from the point of view of practice, alone, it would appear impossible for a pathologist to monopolize the practice of pathology (as any physician with a sink in his office will attest). It seems no more burdensome to regulate that tissues be reviewed by a pathologist than for EKG's to be read by an experienced EKG reader. As usual, the nub of the problem lies in a few pathologists whose vocal cords have not suffered the same restrictions in exercise as their wits. A single *I-have-spoken* attitude on the part of a pathologist does irreparable damage to the anti-monopolistic theme. It is essential that these vaporings be acknowledged as minor. Similarly, it must be made known that pathologists tolerate these people in the same way that other specialists carry their ragtag.

In summary, non-pathologist physicians are invited to recognize the peculiar tie between pathologist and hospital; to acknowledge the impossibility of specialty monopoly; to share the pathologist's aversion to area monopoly; to decry with the pathologist the *I-have-spoken* attitude; and to promote with the pathologist a good and equitable hospital relationship on the basis of private practice.

Sincerely,
Jeff Minckler, M.D.

COOK COUNTY GRADUATE SCHOOL OF MEDICINE
ANNOUNCES
ANNUAL POSTGRADUATE COURSE
of the
UNITED STATES SECTION OF THE
INTERNATIONAL COLLEGE OF SURGEONS
Presented in Cooperation With
COOK COUNTY GRADUATE SCHOOL OF MEDICINE
July 7 - 19, 1958 October 13 - 25, 1958

The United States Section of the International College of Surgeons will again offer its Annual Postgraduate Course, in cooperation with the Cook County Graduate School of Medicine. It will be a two-week intensive review course in General Surgery presented at the Graduate School, and in the wards and operating rooms of Cook County Hospital. Because the course has been oversubscribed in previous years, it will be offered twice in 1958.

The program will be offered under the supervision of the Hospital's Surgical Staff. It will include illustrated lectures, motion pictures, anatomy demonstrations, operative clinics and practice surgery by the participants on anesthetized dogs. Consideration will be given not only to surgical technic, surgical complications and management of the surgical patient, but also to an intensive review of the basic sciences in relation to clinical surgery. In addition to twenty hours of surgical anatomy on the cadaver, the program will include lectures and demonstrations on various aspects of general surgery.

The course will consist of 78 hours of instruction, and participants will be eligible for formal (Category I) credit from the American Academy of General Practice.
Applications should be addressed to:

ocort®

Triamcinolone LEDERLE

...in Respiratory Allergies: "Good to excellent" results in 29 of 30 patients with chronic intractable bronchial asthma at an average daily dosage of only 7 mg.[6]... Average dosage of 6 mg. daily to control asthma and 2 to 6 mg. to control allergic rhinitis in a group of 42 patients, with an actual reduction of blood pressure in 12 of these.[7]

...in Other Conditions: Two failures, 4 partial remissions and 8 cases with complete disappearance of abnormal chemical findings lead to characterization of ARISTOCORT as possibly the most desirable steroid to date in treatment of the nephrotic syndrome.[8,9]... Prompt decrease in the cyanosis and dyspnea of pulmonary emphysema and fibrosis, with marked improvement in patients refractory to prednisone.[10,11,12]... Favorable response reported for 25 of 28 cases of disseminated lupus erythematosus.[13]

Depending on the acuteness and severity of the disease under therapy, the initial dosage of ARISTOCORT is usually from 8 to 20 mg. daily. When acute manifestations have subsided, maintenance dosage is arrived at gradually, usually by reducing the total daily dosage 2 mg. every 3 days until the smallest dosage has been reached which will suppress symptoms.

Comparative studies of patients changed to ARISTOCORT from prednisone indicate a dosage of ARISTOCORT lower by about ⅓ in rheumatoid arthritis, by ⅓ in allergic rhinitis and bronchial asthma, and by ⅓ to ½ in inflammatory and allergic skin diseases. With ARISTOCORT, no precautions are necessary in regard to dietary restriction of sodium or supplementation with potassium.

ARISTOCORT is available in 2 mg. scored tablets (pink), bottles of 30; and 4 mg. scored tablets (white), bottles of 30 and 100.

Forces Opposed to Private Practice

Forces tending to replace private practice by other systems are currently much stronger than those preserving it. If this situation continues, the only uncertain element is the length of time required to destroy private practice. Recent events indicate that the pace is accelerating.

Most important of these is action of Warren Draper, medical director of the welfare fund of the United Mine Workers. Trouble has been brewing in the mining areas for several years. Soon after Draper took control, he began to criticize work done for beneficiaries of the fund by private physicians. At the AMA meeting at Atlantic City in 1955 he claimed that physicians charged excessive fees and that many unnecessary operations were done. By that time he had begun to establish panels of approved physicians and tried to enforce a rule that no beneficiary could be admitted to a hospital without consent of one of the approved physicians.

Battle between Draper and the medical associations of the states within which the UMW Fund operates has been long and acrimonious. Draper has defied the medical associations and has maintained his panels. At the same time he has promoted the idea that he hires only the best doctors and uses only the best hospitals. Gradually the public has been led to believe that the individual private practitioner is inferior.

There is just enough truth in this propaganda to make it an effective weapon against private practice. No very effective force has been raised in opposition. Medical societies have been loath to weed out or otherwise control the few incompetent members whose performance gives Draper the opening he needs to build an empire.

No one can deny that there are physicians who are ignorant, incompetent or dishonest. Their numbers, however, have never justified the attacks made by Draper and others nor do they justify destruction of a system which has great merit.

Efforts of hospitals to establish themselves as centers for community medical service and to enter the field of corporate practice must not be overlooked. The American Hospital Association was not happy with the Iowa decision on such practice and is taking unmistakable steps toward its circumvention, not only in Iowa but throughout the country. Under direction of its Board of Trustees, the Hospital Association directed its legal counsel to prepare a statement on corporate practice. He obliged with monograph on the propriety of corporate practice. Summary of that report was carried in the December 1, 1957 issue of *Hospitals*, official journal of the American Hospital Association. The campaign continues. March 1958 issue of the same journal carries an editorial and several

articles promoting the idea of building the hospital outpatient department as a system of providing medical care.

Officials in governmental bureaus necessarily maintain a mass viewpoint in regard to medicine and seldom understand private practice. The millions given them to spend, therefore, represent a powerful force in developing systems of medical care other than private practice. Current annual expenditure by the Department of Health, Education and Welfare amounts to $646,830,000 and it is going up. More than a fourth of this amount is being spent where the force can be highly effective. The National Institutes of Health control research grants, many to medical schools, spending $189,796,000. Two-thirds of all college research is now supported by the Federal Government.

New legislation to increase spending on medical schemes and to expand social security is being introduced nearly every day Congress is in session. Dozens of such proposals are being considered. A recent example of the lot is one introduced by Representative Zablocki (D, Wis.) in March, to create a Bureau of Older Persons, "to achieve a retirement income sufficient for health *** older persons to receive adequate nutrition, preventive medicine, and medical care ***development of special courses in schools and departments of medicine, nursing, clinical psychology ***."

Senator Morse of Oregon has entered a bill which would amend the social security act to provide many of the benefits proposed in the Forand Bill, increase the wage base and rate for social security payroll taxes and increase social security benefits. Senator Neuberger, also of Oregon, has introduced a bill to increase spending for maternal and child health care from $16,500,000 to $25,000,000 and for hospital and medical care for crippled children from $15,000,000 to $25,000,000.

Another force destructive to the private practice of medicine has been the demagoguery of Paul Hawley who would arouse prejudice and passion by rhetoric and sensational charges to gain influence for himself and the organization he represents. The statements he has released to the press and the magazine articles he has helped prepare have done so much harm that physicians themselves have begun to believe that many members of their own profession are either dishonest or corrupt. A recent survey in the Northwest brought out the amazing fact that 20 per cent of physicians believe most other physicians are crooks.

With all these adverse influences, all these malevolent criticisms and all these proposals for systems to replace the private practice of medicine, it is no wonder that young physicians, now in training or just out, shun private practice believing that they should be employed in some kind of a panel system so that they would not be required to work more than 40 hours a week and could have Saturdays and Sundays off.

Nearly 30 years ago Ortega deplored the fact that Europe had been left without a moral code. It was not the amorality which disturbed him so much as the fact that the attitude toward life had become one of demanding all the privileges but accepting none of the obligations.

Unless those who believe in the private practice of medicine start accepting some of the obligations to preserve it, the forces aligned against it seem certain to prevail.

Antibiotic Danger

Against the life saving benefits of antibiotics it is now necessary to weigh the dangers. Undesirable reactions have increased as we have moved into annual utilization of these products in quantities measured in hundreds of tons. In some classifications of reactions, mortality rates have been as high as 50 per cent.

Much of this information was presented at Portland last month by Lowell Rantz, one of the

Sommer Memorial Lecturers who addressed the 43rd annual meeting of the University of Oregon Medical School Alumni Association. He gave particular emphasis to the problem of superinfection and the disaster which can follow in its wake.

Superinfection occurs when, during antibiotic treatment, a second organism, resistant to the antibiotic being used, invades and causes illness. In some of these superinfections, such as staphylococcal enterocolitis, the second infection may be much more severe than the first and it can be fatal rapidly. Likewise, staphylococcal pneumonia may develop during antibiotic therapy and produce death unless the physician is alert to the danger and alters therapy in time.

Two factors are responsible. One is the ability of certain organisms to develop resistant strains. The other is the natural sequence of events which follows elimination of any organism or group of organisms. Rantz explains this phenomenon by stating that Nature abhors a sterile surface as much as she does vacuum. While it may be possible to achieve elimination of organisms from the intestinal tract for a short time, the condition cannot be maintained. New, nonsensitive organisms move in to replace those eliminated and they flourish.

When a patient who has fever is treated with antibiotics, his temperature is apt to fall after about 48 hours. If this fall is followed in a day or two by significant rise in temperature, superinfection has occurred and serious outcome may be expected unless treatment is changed.

There are other classifications of undesirable reactions. A recent report[1] lists them as severe and not severe. Severe reactions included superinfection, anaphylactoid reaction, severe skin reaction, blood dyscrasia and angioneurotic edema with respiratory or cerebral involvement. Those considered not severe include angioneurotic edema and urticaria, other dermal lesions, serum sickness type of reaction, diarrhea and local moniliasis.

Survey by Welch *et al.* covered experience of 1,637 physicians, and 827 hospitals with bed capacity of 198,332. Period studied was from late 1953 to early 1957. Case histories in the study numbered 3,419. After elimination of incomplete records there remained 2,995 cases of which 1,925 were classified as not severe or non-life-threatening and 1,070 which were severe or life-threatening.

By far the largest number of severe reactions were anyphylactoid reactions and penicillin was responsible for nearly all of these. Deaths in this group followed intramuscular injection of penicillin alone or in combination with streptomycin or dihydrostreptomycin. Other than parenteral routes accounted for only 59 of 793 anaphylactoid reactions to penicillin. One followed use of a syringe contaminated with penicillin. A few cases occurred when a dose prepared for others was simply tasted and one woman had typical shock soon after starting to suck a penicillin troche. Anaphylactoid reaction followed other antibiotics in only 16 cases and most of these were result of streptomycin or dihydrostreptomycin. In the total of 809 such cases there were 74 deaths.

Superinfection was next in number of severe reaction cases. There were 107 of these and 74 were staphylococcal enterocolitis. An additional 25 cases of enterocolitis were encountered but the offending organisms were not identified. Of these 99 cases, 39 were fatal. One death followed pulmonary moniliasis.

There were 70 cases of severe skin reaction with 7 deaths. Blood dyscrasia appeared in 46 cases, of which 27 died. Angioneurotic edema with respiratory or cerebral involvement accounted for 38 cases and 5 deaths. Penicillin was the responsible agent in 80 per cent of all the cases studied and approximately 9 per cent of those who had reactions to penicillin were listed as fatalities.

Welch *et al.* estimate about 10 per cent of U. S. population as capable of becoming sensitive to antigens. Since few have escaped being dosed with penicillin in some form, there are in this country about 17,000,000 persons who are candidates for some grade of reaction to penicillin. Anaphylactic shock is the most likely type. Superinfection, most apt to follow tetracycline administration, has lower incidence rate but much heavier mortality when it occurs.

From these reports and warnings it can only be concluded that the antibiotics are far from harmless preparations. They have saved countless thousands of lives, many more thousands of days and a vast amount of disability. Against these benefits, it is necessary to weigh the potentialities for harm when these products are prescribed. Unnecessary use cannot fail to produce unnecessary disability and unnecessary death. •

Bile Peritonitis

RAYMOND E. ANDERSON, M.D.
MCMINNVILLE, OREGON

Extravasation of bile into the peritoneal space is an extremely serious clinical problem. It has been estimated that 50 to 60 per cent of patients die during the acute stage of the disease,[1] and those who are fortunate enough to recover, frequently are left with serious sequelae which are difficult to manage and often lead to long periods of convalescence and disability.

Appreciation of these factors has stimulated considerable experimental work in an effort to understand better some of the basic pathologic aspects of the disease. These studies have been contradictory in many respects, however, and there still remain many unanswered questions regarding toxicity, physiologic effect and lethal properties of free bile in the intraperitoneal space. Furthermore, there have been relatively few reports dealing with the clinical aspects of the disease and, generally speaking, bile peritonitis has not received the attention or sustained interest that peritonitis originating from other causes has been afforded.

Several factors may be responsible for this. Among these are: a) Belief that the pathologic process of bile peritonitis is similar to that which operates in other types of peritoneal infection and thus deserves no special emphasis. b) Widespread use of antibiotics has resulted in a false sense of security relative to the potential hazards of leaking bile. c) Misconception that bile peritonitis is a rare condition which is unlikely to be seen by the average practitioner. d) The feeling that postoperative bile peritonitis is a surgical complication which carries the stigma of poor surgical technique or faulty postoperative care.

The observation and care of a number of patients who have suffered this affliction serves as the background for this report. In consideration of the problems encountered in their care, a brief review of the subject appears to be justifiable, not only as a means of obtaining a better understanding of the interesting aspects of the disease, but also to re-emphasize some of the basic but often neglected principles involved in its surgical management.

Etiology

The term *bile peritonitis* must be qualified, for sake of this discussion, to represent the phenomenon occurring within the peritoneal cavity as a result of the outflowing of bile from some point directly along the biliary tree. Excluded, therefore, are the peritoneal contaminations resulting from perforated abdominal organs in which other chemical or bacterial factors play a role of equal or greater importance than that of bile alone.

Bile may escape the confines of the biliary tract and flood the peritoneal space in a number of ways (see table 1), the most common probably being that which follows trauma to the liver or extrahepatic collecting system. Upper abdominal penetrating wounds frequently produce injury to underlying structures by puncture or laceration, whereas blunt or crushing force may result in shearing, tearing or contusion. Because of its size and mass, the liver is most likely to be involved in the latter type of injury. It has been suggested that the likelihood of rupture or laceration of the extrahepatic structures resulting from nonpenetrating trauma depends upon the presence of either pre-existing disease[2] or a

Toble 1. Etiology of Bile Peritonitis.

I. *Trauma*
- A. Penetrating abdominal wounds.
- B. Non-penetrating abdominal wounds.
- C. Surgical trauma.
  - 1) Accidental injury to liver or bile ducts.
  - 2) Slipping or slough of cystic duct ligature.
  - 3) Accessory bile ducts opened.
  - 4) Faulty anastomosis.
  - 5) Aspirations, biopsies.

II. *Infection*
- A. Obstruction with perforation.

  - 3) Neoplasm.
- B. Infection with necrosis.

III. *Congenital Abnormalities*
- A. Cysts.
- B. Cystic dilatation.

IV. *Idiopathic Conditions*
- A. Spontaneous perforations.
- B. Microscopic perforation (biliary "dew").

state of physiologic distension of these structures at time of the accident.[3]

Extravasation of bile is often a complication of elective operative procedure upon the liver or bile ducts. The "perfect" cholecystectomy has not infrequently been followed by a bile peritonitis resulting from an eroded or slipped cystic duct ligature or the opening of unrecognized or overlooked accessory ducts with subsequent leakage. Failure to seal a T tube into the common duct by adequate snug suture or its premature removal can allow the escape of bile, as can poorly developed anastomoses, biopsies, aspirations or operative injuries along the course of biliary flow.

Rupture of the biliary tract as a consequence of infection has long been a recognized phenomenon. Just how frequently this eventuates in a spreading peritonitis when the gallbladder itself is involved is a matter of some disagreement.[4-6] There can be no doubt, however, that increased biliary pressure, secondary to obstruction, commonly results in infection, ulceration, and perforation with an outpouring of highly contaminated bile.[7] Impacted stones are probably the most common initiating factor although neoplastic growth, congenital dilatation or stricture may also be held accountable for this phenomenon.[8]

Idiopathic leakage of bile, in which peritonitis develops in the absence of any demonstrable source of leakage, has been a subject of interest and controversy for many years. The presence of biliary "dew" produced by filtration of bile across the wall of the extrahepatic biliary channels or gallbladder has been given credence by some,[9,10] although those who have reported some cases are of the opinion that the phenomenon represents actual microscopic perforation or perforation with subsequent sealing which is undetectable even to the most exacting scrutiny at the time of surgery or autopsy.[11]

Congenital defects of the biliary tract have, by one means or another, led to bile peritonitis in children.[12,13] Spontaneous perforation without preceding history of trauma of infection has been observed to result in a spreading type of bile peritonitis.[14]

It would be impossible to hazard a guess as to which of these factors occurs more commonly. Writers have registered diverse opinions in this respect reflecting their personal observations of the clinical material available for study. The exact etiologic frequency is not of any great importance, however. More fundamental is the fact that ultimate salvage or loss of the patient may depend upon recognition and appreciation that any of these mechanisms potentially may lead to the development of this disastrous complication.

Pathology

Within the past 60 years conflicting opinions have been presented regarding the toxic and lethal effects of free bile within the peritoneal space. There are those who believe that its presence is innocuous and of relatively little danger to the host.[15-17] These workers cite instances of patients who have sustained large collections of intraperitoneal bile over long periods of time without succumbing to its effects. It cannot be denied that such observations lend some support to the contention that intraperitoneal bile is harmless. More likely, they merely serve as examples of the fact that choloperitoneum does not terminate in a fatal issue in every instance.

On the other hand, the bulk of recent experimental and clinical evidence appears to support the conclusion that free intraperitoneal bile is extremely irritating and often accompanied by serious and profound reaction and sequelae.[18,19] Analysis of the local pathologic process emphasizes this hypothesis and offers some explanation as to why the disease, in a high percentage of cases, ultimately leads to prolonged morbidity or death.

Human bile is a highly complex alkaline sus-

pension. The solid elements consist primarily of bile salts, bile pigments, cholesterol, lecithin, fatty acids and mucin. Of these components the only ones which are known to be toxic are the bile salts, sodium glycocholate and sodium taurocholate.[20] Bile itself has no enzymatic properties and its lethal effect is dependent upon reaction of the tissues to contact with the bile salts.

Both sodium taurocholate and sodium glycocholate are capable of dissolving the lipoid content of the cell membrane, disturbing and lowering the surface tension of the peritoneum. Phagocytic activity of leucocytes is impaired or the cells themselves are destroyed by action of the bile salts. Atony of capillary and venule walls may also result. Combination of bile and bacteria is highly virulent, not because of the effects of bile upon the bacteria but because of the greater effect of bile upon phagocytosis, permitting uninhibited bacterial growth through inability of the host to mobilize adequate local defensive barriers.

In response to the sudden outflowing of bile, therefore, a certain chain of events is set into motion which disrupts the dynamics of intraperitoneal equilibrium. Congestion and edema of the intraabdominal viscera occur with increased permeability of the cell membranes. There is rapid exudation of fluid in response to this initial insult. Harkins and his co-workers[21] have stated that the volume of this exudate may approximate 30 per cent of the blood volume or 60 per cent of the circulating plasma volume when bile peritonitis develops. The reticulo-endothelial system is inhibited and the inflammatory response depressed. A local necrotizing effect takes place and if bacteria are present they multiply with extreme rapidity. The inflamed and congested peritoneal surfaces allow absorption into the blood stream of toxic amounts of bile salts and products of bacterial growth with resulting systemic effect. The liver, kidneys, spleen and pancreas may become involved secondarily with further decrease in the host's resistance.[22]

Slower outpouring of bile results in less intense reaction. The defensive mechanisms of the body have a longer period of time to mobilize for protection. Local transudation of fluid undoubtedly dilutes the extravasated bile rendering it less virulent and more easily combatted. The greater omentum migrates to the point of perforation and, in combination with the adjacent viscera, effects a walling-off process which localizes and resists the spread of the inflammatory fluid. Immense capacity of the greater omentum to halt the spread of even virulent bacterial infection has been demonstrated.[23] It plays an equally important role in the body's defenses against bile peritonitis.

That bile itself, in its sterile state, is capable of producing these reactions has been proven experimentally[24] and is confirmed by the fact that many people die of acute bile peritonitis within 24 hours of its onset, prior to a time that any effect of bacterial growth can become lethal.

Morbidity or mortality in bile peritonitis, therefore, is the result of factors initiated by the local pathologic process, exerting their influence through one or a combination of several of the following ways.

1) The toxic properties of bile salts themselves which may saturate the organism to the point of death.[24-26]

2) Infection, whose local and systemic effects disrupt the equilibrium of the host.[27,28]

3) Shock, resulting from the outpouring of large quantities of fluid into the peritoneal space, associated with a lowered blood volume, fall in blood pressure and hemoconcentration.[21,26,29]

Copious amounts of bile stained fluid within the abdominal cavity does not necessarily indicate the presence of bile peritonitis. Ravdin and his co-workers[30] have demonstrated that bile ascites may develop when bile stasis secondary to hepatic duct obstruction is present and collateral circulation inadequate. The bile salts and pigments present in the ascitic fluid gain entry by diapedesis through the blood vessel walls rather than directly from the biliary tract and are present in considerably less than toxic concentrations. Evidence of peritoneal irritation is absent and symptoms do not result unless infection is introduced from some other source.

Diagnosis

There does not appear to be any consistent correlation between symptoms and degree of peritoneal contamination, although the elements of time and survival tend to divide the early stages of the disease into the acute or subacute phases, each with characteristic symptoms and physical findings. Based upon a consideration of the pathogenesis of the disease, it would appear likely that the patient's response would parallel the degree of initial peritoneal involvement but such a theoretic consideration is not

borne out by clinical observation.[19] Some patients react violently and deteriorate rapidly when a small amount of intraperitoneal bile is present. Others may sustain massive extravasation and appear to tolerate the insult with considerable stamina. Douglas and Grey Turner[31] have classified bile peritonitis into two categories, the first group comprising those persons in whom the bile is present as a localized collection somewhere within the abdomen and the second incorporating those with a generalized diffuse peritonitis. While this classification is based upon precise pathologic representation of the disease, it does not take into account either the elements of time or symptomatology. No simple classification can adequately or accurately incorporate the many ramifications of the early stages of the disease. The terms *acute* and *subacute* are acceptable as a means of categorizing the early clinical symptoms, and the later untoward results could well be described as the chronic stage, or as complications resulting from the initial pathologic process.

Acute Period

Sudden agonizing abdominal pain, associated with nausea, vomiting, tachycardia and shock, are the first responses to sudden outpouring of bile into the unprepared abdominal cavity. Abdominal distension, tenderness, evidence of spreading peritoneal irritation and ileus follow rapidly within a short time, usually a period of a few hours. These symptoms are not unlike those seen in acute pancreatitis or with perforated duodenal ulcer and some cases have been mistakenly diagnosed as coronary artery thrombosis.

As the process continues, the shock may persist or deepen and the temperature may elevate alarmingly. There is likely to be an increase in bile flow from the abdominal drains if the patient is in the recent postoperative period, although the absence of this phenomenon is no assurance that the patient's immediate plight is not on the basis of deep leaking bile. Reynolds[32] has pointed out the danger of believing that increased drainage in the presence of symptoms of peritonitis is an indication that accumulation within the abdomen is not taking place. Such is rarely true.

The effect of an acute biliary perforation may be compounded if the bile is highly contaminated or concentrated, or if the patient is debilitated. History of recent abdominal trauma or biliary tract surgery are important diagnostic considerations and it is rare that diagnosis of acute biliary peritonitis is made by means less than exploratory laparotomy when such history is absent.

Subacute Period

Unless the patient expires within a short period of time, remission may occur,[9] or at least the clinical picture may stabilize to a certain extent. The temperature may decline and the blood pressure begin to rise slowly. The abdomen may actually become less tender and the initial excruciating pain be replaced by more generalized, dull, aching distress. A doughy feeling replaces the tense distension of the initial acute stage and shifting dullness may be elicited. The patient frequently complains of hiccups. Jaundice commonly develops. Extreme lethargy grips the patient and there may be mental deterioration. It is during this period that the omentum and viscera are attempting to combat the further spread of bile by walling it off into cavities or loculation within the abdominal space. Thus, the subacute phase of the disease may last for days or weeks when the point of leakage is a tiny one and the bile sterile, or it may terminate suddenly in death if the defenses are unable to withstand a massive outpouring or virulent infection.

Chronic Period

Unless definite measures are instigated to prevent their occurrence, survival of the early stage of the disease is frequently followed by complications which are serious and disabling. Because of severe inflammatory reaction of the peritoneal surfaces and irritation of the bile salts to the capillary walls, constant exudation of fluid may ensue with resulting ascites not unlike that observed in cirrhosis or carcinomatosis.[7] Should healing of the injured serosal surfaces take place by development of dense scar tissue, chronic adhesive peritonitis is the result. There is then danger of obstruction or perforation.

Accumulation of liquid in the subphrenic space is a potential complication of any type of peritonitis but is especially hazardous as a result of bile leakage. Because of its location, the usual means of conservative therapy are ineffective and its presence over a period of time may lead to pulmonary as well as abdominal disturbances. Maguire[7] has discussed the chronicity of external

biliary fistulae as a complication of bile peritonitis and emphasized the problems inherent in its management and eventual eradication. Dehydration, electrolyte disturbances, sepsis and malnutrition generally accompany the chronic loss of large amounts of bile and the surgeon is frequently confronted with the decision as to whether masterful inactivity or surgical intervention offers the best means of early rehabilitation.

Therapy

Discussion of the treatment of bile peritonitis must incorporate first an appraisal of the means by which its development may be avoided. Of primary importance, in this respect, is the utilization of routine drainage of the operative site following elective procedures on the liver or biliary tract or after traumatic wounds to these structures have been repaired. Drains should be placed close to the area of manipulation and may be sutured to an adjacent bit of tissue with very fine catgut to prevent their movement, if copious drainage is anticipated. Here they should remain until they no longer serve their purpose and flow has ceased. Soft rubber tubes serve best for this for they can be aspirated if necessary. Penrose casings are adequate if the abdomen is not closed too tightly about their exit.

Other preventive measures include suture-ligation of the cystic duct stump, careful closure of accessory ducts and reperitonealization of the gallbladder fossa if the liver has been traumatized during cholecystectomy.

Once the diagnosis is established, immediate surgical drainage is indicated. Hall[33] has stated that 90 per cent of patients will recover if operated upon within the first 24 hours after onset, whereas only 60 per cent will survive if 24 hours elapse, and but 40 per cent will remain alive if delay is continued for 36 hours. It may be necessary, in some instances, to employ peritoneal aspiration to substantiate the presence of extravasated bile and precipitate the decision to undertake laparotomy. This technique is of extreme value as a diagnostic aid, but is worthless for therapeutic purposes in the early stages of the disease.

Upon opening the abdomen, bile stained fluid will gush forth into the wound if a free extravasation has occurred and it will be observed that the viscera are deeply stained, edematous and inflamed. Locculation is most likely to occur in the subhepatic, subphrenic spaces, the lateral gutters, or within the pelvis. Regardless of its whereabouts, all of the fluid must be removed, after which thorough lavage with warm, normal saline should be carried out. Search for and repair of the point or points of extravasation must be undertaken, the area adequately drained and the incision closed in routine fashion. Cholecystectomy or cholescystostomy may be required if extensive damage to the gallbladder is discovered.[20]

Should the surgeon fail to identify the source of leakage, as is frequently the case, drainage alone is required. This procedure will establish an external fistula, allowing the bile to flow harmlessly to the outside, in the event leakage continues. Such a fistula will eventually close spontaneously or offer a means of locating the source of its flow at subsequent exploration should it become necessary.

Shock which accompanies the acute stage of the disease has been shown to be a vitally important and lethal factor in contributing to its high mortality rate. Its development must be combatted vigorously by immediate administration of whole blood, blood plasma or Dextran. Liberal amounts of intravenous fluids are required to maintain adequate hydration, and the serum electrolytes must be kept in proper concentration and balance. Antibiotics are indicated because of the great hazard of unopposed bacterial growth. *Escherichia coli*, streptococci and upper respiratory inhabitants may be expected as the most common invaders,[20] but it is imperative that cultures be taken and sensitivity studies instigated at the time of laparotomy. Gastric or gastrointestinal decompression is warranted to prevent protracted vomiting and to minimize the effects of distension of the small bowel. Oxygen, digitalis and other supportive measures affording symptomatic relief may be needed in severe cases.

During its chronic period, the disease frequently taxes the surgeon's ingenuity and patience. Adhesive peritonitis may complicate the convalescence and require repeated periods of intestinal intubation to ward off impending obstruction. If this type of conservative management proves to be unsuccessful, laparotomy and lysis of the adhesive bands becomes mandatory. Intractable or recurrent cases may require side-tracking or plication procedures in order to

obtain permanent relief. Persistent external biliary fistula may remain as the aftermath of acute peritonitis, with considerable distress and disability to the patient. The majority of chronic fistulae will close spontaneously if given enough time, and provided there is no distal obstruction. Those that do not close within a reasonable period of time, or result in severe and rapid debilitation of the patient despite supportive therapy must be repaired surgically.

Collections of bile within the subhepatic or subphrenic spaces will rarely be absorbed and once their presence is detected they should be evacuated. Unless this is done, internal fistulae, hepatic inflammation or diaphragmatic and pleural irritation can ensue. The transudate which occasionally accumulates within the abdominal cavity as a later response to the initial inflammatory process is generally of little consequence. If persistent or symptomatic, aspiration is the simplest means of effecting a cure.

Three representative case histories demonstrate several of the pitfalls and problems relative to the prevention and treatment of the disease.

CASE REPORTS

Case 1. A 60 year old white male entered St. Luke's Hospital, Chicago, Illinois, on May 9, 1954 with history of right upper quadrant pain associated with nausea and vomiting for approximately 48 hours. Past history revealed that in September 1953 the patient underwent cholecystectomy and common duct exploration for common duct obstruction. The patient made uneventful recovery from this operation and six weeks after his discharge from the hospital the T-tube was removed without incident. In December 1953, however, the patient was readmitted to the hospital at which time approximately 400 cc. of purulent matter was removed from under the right diaphragm. After a rather stormy course the patient was discharged on Dec. 24, 1953 symptom free. In January 1954 the patient was again admitted to the hospital, this time with complaints of chronic abdominal pain, nausea and the passage of light stools. These symptoms had been present for approximately 10 days. Examination and workup revealed evidence of extrahepatic biliary obstruction. Diagnosis of common duct stone was made. On Jan. 16, 1954 the patient underwent surgery. Adhesions were found about the common duct, a fistulous tract was dissected free to the common duct but no obstruction was demonstrated. A T-tube was placed in the common duct for drainage and after an uneventful recovery the patient was discharged from the hospital with a T-tube in place, on Feb. 3, 1954. Three weeks prior to the present admission the T-tube was removed after having been injected with Lipiodol and negative findings established. At time of the present admission the patient's temperature was 99.8 F., his pulse 120 and blood pressure 100/60. Physical examination revealed the patient to be extremely ill and in state of shock. The abdomen was tight, exquisitely tender, with evidence of spreading peritonitis. White blood count was 11,000; red blood count 4,280,000; serum amylase was 60 units; the sedimentation rate 15. X-ray of the abdomen revealed some ileus. Surgery was undertaken May 10, 1954 at which time an incision was made through the previous right upper quadrant scar. Upon entering the peritoneal cavity 2,000 cc. of clear bile was aspirated. Dissection through many adhesions was carried down to the area where the T-tube had emerged from the common duct and it appeared that this was the point of drainage. The area was closed carefully with silk and drained. Another soft rubber drain was placed in the right lateral gutter and the abdomen closed with through and through wire sutures. Profuse drainage appeared through the tube for several days but subsided slowly. The patient made an uneventful recovery and was discharged from the hospital on June 2, 1954. Subsequent to that time the patient has complained of some abdominal pain, has been slow to regain his previous activity but otherwise has had no further acute abdominal episodes.

COMMENT: This case demonstrates the fact that, despite previous abdominal operations producing adhesions and possibly some peritoneal immunity, the extravasation of free bile can result in acute peritoneal reaction within a short period of time.

Case 2. A 58 year old white female underwent abdominal laparotomy with cholecystectomy and common duct exploration Jan. 7, 1954. A T-tube was placed in the common duct for drainage and the patient made uneventful recovery. She was discharged from the hospital on Jan. 23, 1954 without symptoms and with free biliary drainage from the T-tube. On March 25, 1954 the patient was re-admitted to the hospital with severe abdominal pain, some jaundice and nausea. Symptoms had been present for five days prior to her admission. The T-tube had been removed nine days previously and within 48 hours after its removal the patient began to experience vague abdominal distress. Upon admission her temperature was 100.2 F. Blood pressure was 130/90 and pulse 80. The patient seemed to be somewhat lethargic but in no serious state of shock. The abdomen was distended, had a doughy feeling and bowel sounds were present. X-ray of the abdomen revealed ileus but no evidence of acute bowel obstruction. There was deep tenderness in both lower quadrants of the abdomen but the upper abdomen appeared to be normal. White blood count on admission was 14,500; quantitative Van den Berg a total of 3.68 units; serum electrolytes were normal; blood sugar was 172 mg. The patient was treated with intravenous fluids and gastric intubation. She responded well to this management. At no time did she localize symptoms in the upper abdominal quadrants and after approximately 72 hours in the hospital, appeared to be considerably better. Upon removal of the gastric tube and discontinuation of fluids, however, the patient experienced nausea and vomiting, and was unable to remain in a normal state of hydration. Diagnosis of slowly developing bile peritonitis was established and on March 30, 1954 the patient underwent surgery. The previous right upper quadrant incision was opened and upon entering the peritoneal cavity approximately 2,500 cc. of clear bile was obtained by aspiration. The bile was not loculated in any quadrant but filled the entire peritoneal cavity. The viscera were deeply stained and granular. Exact source of the leakage could not be demonstrated as considerable adhesions were present about the porta hepatis. A large Penrose casing and soft rubber drain were placed into the lesser peritoneal space and brought out through the lower pole of the incision. The abdomen was closed with through and through wire

sutures and the patient given supportive therapy. She made an uneventful recovery; the jaundice subsided rapidly, and on April 14, 1954 she was discharged from the hospital free from symptoms. The drains were left in place another week until drainage ceased and then were removed. The patient gained strength rapidly and was rehabilitated within three weeks after her discharge from the hospital.

COMMENT: The presence of free bile in the peritoneal cavity does not always result in an acute episode. This patient demonstrated the fact that, despite immediate leakage from a common duct rent, with massive biliary peritonitis, acute reaction is not always demonstrated. Upon drainage of free bile the patient can make an uneventful recovery.

Case 3. A 23 year old white male, entered the 11th Evacuation Hospital on Aug. 16, 1951 with history of having received an upper abdominal penetrating wound seven days prior to this admission. Original exploration of the abdomen at the time of injury revealed the patient to have sustained a penetrating wound of the liver and laceration of the jejunum. The jejunal lacerations had been repaired carefully, the penetrating wound of the liver approximated and the abdomen closed without drainage. The patient appeared to make an uneventful immediate postoperative recovery and seven days after the original surgery was evacuated to the rear. Upon admission to the 11th Evacuation Hospital the patient appeared to be in a fairly good state of hydration; the abdomen was soft; he was passing gas, and a moderate amount of material was being aspirated from a nasogastric tube. The patient's temperature and white blood count were within normal limits on admission. Within 48 hours, however, he began to develop evidence of peritoneal irritation. The abdomen became distended, tense and exquisitely tender. He became jaundiced and began to deteriorate rapidly. On the eighth postoperative day abdominal explorarion was undertaken for diagnosis of spreading peritonitis. Upon opening the abdominal cavity through the previous incision, a massive amount of free intraperitoneal bile gushed into the wound and it was found that the bile originated from the previous penetration of the right lobe of the liver. Several sutures were placed across the leaking area and drainage was carried out using several large soft rubber drains into the lesser peritoneal space, right subphrenic space and subhepatic space. These were brought out through the lower pole of the incision. Postoperatively the patient did poorly and despite massive doses of antibiotics, intravenous therapy and other supportive measures, expired within 48 hours.

COMMENT: In spite of this patient's youth and minimal intraabdominal injury, the presence of free bile originating from the liver resulted in a massive peritonitis which terminated in his death. It demonstrates well the fact that all incisions or wounds into the biliary tract should be drained to prevent the accumulation of free intraperitoneal bile.

Summary

Bile peritonitis is a catastrophe which may follow accidental or surgical trauma to the biliary tract, congenital abnormalities or as a result of spontaneous perforation.

The extremely irritating properties of bile and its ability to inhibit normal defensive phagocytosis tend to produce severe peritoneal reaction, which, if untreated, terminates in fatal issue in 50 to 75 per cent of the cases. Acute and subacute stages of the disease are treated by immediate irrigation and drainage of the peritoneal cavity, and closure of the point of extravasation, if possible. Shock and dehydration accompanying the early phases must be corrected and antibiotics employed to combat infection.

Unless early and vigorous therapy is undertaken, sequelae develop which are chronic and disabling. Adhesive peritonitis, biliary fistulae, perihepatic abscess or intraperitoneal fluid accumulation may require subsequent surgical correction.•

Backache of Muscle Tension Origin

THEODORE L. DORPAT, M.D.
AND
THOMAS H. HOLMES, M.D.
SEATTLE, WASHINGTON

Pain in skeletal muscle is related to ischemia. It may follow sustained contraction or intermittent contraction with short rest periods. If a patient whose usual response to a situation involves muscular activity is unable to act, he may experience sustained contraction with ischemia and pain.

In an attempt to arrive at a more comprehensive understanding of the relationship between feeling states, life situations, and backaches, the following studies were undertaken to elucidate the participation of skeletal muscle activity in behavior leading to back pain. Other experiments were designed to demonstrate the relationships between skeletal muscle contraction and skeletal muscle blood flow in the genesis of muscle pain. The literature has, in recent years, contained articles implicating emotional disturbances as an etiologic factor of backache[1-3] and studies of the psychophysiologic mechanisms through which pain is produced.[4-6]

Patterns of pain and muscle activity were studied in 65 subjects ranging in age from 14 to 56 who were observed from one to six times weekly for periods lasting one week to two years. Onset in some followed bending, turning, lifting, and straining. There were varying degrees of disability. Pain was experienced deep to the skin, was poorly localized, and characteristically of a dull, aching quality. In most patients pain was limited to the lower lumbar area, but in some extended as far as the neck or the extremities. Objectively the muscles were often tense and firm to palpation. The pain and spasm sometimes limited activities such as lifting and bending. There was frequently pain on straight leg raising. Muscle tenderness was a common feature at one time or another during the course of the disorder and was sometimes localized in trigger areas. Pressure over these areas could engender pain or accentuate referral of pain.

Routine laboratory and radiologic studies in this group were, in the main, non-contributory. One patient had a bony defect in the neural arch of the fifth lumbar vertebra and another spondylolisthesis of the same vertebra. Six showed minimal osteoarthritic lipping of the vertebral bodies which was not judged to have contributed to their symptoms. Only one had a herniated nucleus pulposus. The method used in this study has been reported previously.[1] In brief, action potentials from the back muscles were recorded on an eight-channel ink-writing oscillograph by means of subcutaneously placed bi-polar needle electrodes applied bilaterally to the skeletal muscles of the torso and the extremities. Pain intensity was estimated by the subjects on the basis of an arbitrary scale of 0 to 10+, 10+ representing the maximal pain in the subject's experience. Amount of muscle activity was computed by analysis of the electromyographic records.

Psychiatric interviews elucidating the emotional reactions to stressful life situations and the family and social history were obtained and notes were made of interviews during the course of the experiment. Highlights from several of these case studies will be reported in some detail.

CASE 1

A 32-year-old white Roman Catholic housewife and part time registered nurse complained of low back pain

of five years' duration. She was a tense anxious woman whose main defense against anxiety was "keeping busy" and being active. She was the tenth of thirteen children and was born of a domineering and querulous mother and an ineffectual, passive, alcoholic father. She called herself a tomboy since as a youth she had participated in boys' sports and had frequent fights with both boys and girls. Her unhappy childhood was marked by temper tantrums, enuresis, and nightmares until the age of 10. She was excessively dependent on her mother and took over much of the responsibility in the home to win her mother's approval. She alternated between passive submission through working hard and angry rebellion against her unappreciative mother.

She maried outside the Catholic Church to a man who, like her mother, was both demanding and unsympathetic. By working part time and keeping a meticulously neat home she attempted to win the satisfaction which was lacking in her marital relationship. Unable to express her feelings of hostility and resentment she suppressed them or ruminated over the injustices she suffered. After the birth of her second child she became increasingly disturbed with complaints of fatigue and loss of energy. Her appetite was poor and her fitful sleeping was frequently interrupted by anxiety dreams.

In this setting of prolonged and mounting conflict the patient first became aware of persistent backache. During an interview with the subject, action potentials were recorded from the muscles of the lumbar region and the posterior thighs (Fig. 1). During the discussion of her

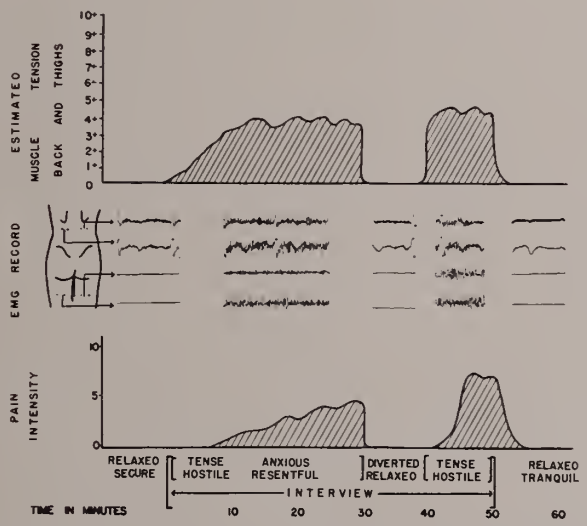

Fig. 1. The genesis of low back pain accompanying interview provocative of conflict, anxiety, and generalized skeletal muscle hyperfunction. (Reprinted with permission of Psychosomatic Medicine from the January-February issue, 1952, p. 26, and of the Williams & Wilkins Co., Baltimore, from the 1949 Proceedings of the Association for Research in Nervous and Mental Disease, 1950, p. 750.)

unhappy childhood she ventilated her feelings of guilt and hostility. As she discussed this highly charged topic her posture on the table was remarkable for stiffness and immobility. Only six minutes after the interview started she complained of a dull aching pain in the low back area and buttocks. With the change, after 30 minutes' interviewing, to more neutral topics she became visibly relaxed. The pain disappeared as her muscles relaxed and electrical activity subsided. Exploration of the sensitive topic was resumed after eight and a half minutes with the characteristic reappearance of increased posture rigidity, sustained muscle tension, and back pain. "This is as bad as the worst backache I ever had." Toward the end of the interview, the interviewer was more supportive and she became tranquil and relaxed; the muscle tension and pain disappeared.

In the group studied, the backache syndrome most commonly appeared in settings of threatening life situations evolving from difficulties in personal and social adjustments. In such situations these individuals are often unable to take positive measures to resolve their difficulties for fear that their action may add to their insecurity and frustration. Fear over retaliation or punishment for their angry feelings frequently inhibits them from action. In this way the impulse to move or to be active arising out of their intense feelings is restrained. These contrasting forces are reflected in their posture and use of skeletal muscles. Rigidity and stiffness of posture reflect both the impulse to move and the simultaneous resistance of movement.[5]

CASE 2

Another subject was a 46-year-old man who had emigrated with his family to the United States from Italy at the age of 6. The subject was the youngest of three children born to a stern father, who worked as a tailor, and a perfectionistic and demanding mother. His childhood pattern for gaining security was based on being a "good boy" who performed well in ways to win the approval of his parents and other authoritative figures. Fear of being punished or rejected led him to avoid fights or other open expressions of hostility. Still he was an active, even restless child. After high school graduation he worked at a succession of "menial" jobs, always quitting because he felt "mistreated" and "taken advantage of" by his boss or fellow workers.

Following his marriage at the age of 22, he was able to slowly improve his social and economic status. For 24 years he worked as an electrician for a large company. Constantly frustrated in his efforts to get ahead, he attributed his dissatisfaction to the malevolence or neglect of his employers and bosses. During the preceding nine years he had marked a particular superior as the one responsible for his difficulties. He reacted to what he imagined to be unjust treatment with strong feelings of resentment and anger. Gradually relations with others became notably more strained and marked by suspiciousness and withdrawal. As he became more tense and restless, he experienced difficulties in making decisions, loss of energy, insomnia, and persistent feelings of fatigue. It was during a period of particularly sustained and bitter recriminations with his superior that the subject had fallen from a ladder and "injured" his back. Examination at that time revealed no evidence of a ruptured intervertebral disc or other structural abnormality. The examiner had noticed sustained spasms of the paravertebral muscles. During the ensuing two years, as compensation litigation was in progress, he felt more and more rejected by his company to which he felt he had sacrificed the best years of his life. Occasions when

he was especially dissatisfied and hostile over what he thought were "excessive" demands made by his superior were closely related to periods of back pain. Following the injection of 0.4 Gm. sodium amytal intravenously the reclining patient was interviewed as the electromyograph recorded action potentials from the lumbar sacrospinalis, the trapezius, and the ham-string muscles. In the interview the subject discussed his difficulties with his superiors and his unsatisfying work situation. As he gave vent to his feelings of anger, resentment, and humiliation, he became tense and restless. The climax in the interview was associated with maximum discharge of electrical activity in a heated discussion of his accident. At a time when both pain and muscle tension were at a maximum in the interview, he said, "The next night (after the accident) the boss came to see me in the hospital. I was in a stupor, but I recognized him. He said he had called my wife and she said I had fainted on the ladder. I said, 'Mr. H. . . ., that's not true . . . a lie . . . not the way it happened . . . I slipped and fell . . . never sick before in my life.' He was trying to cover up the whole thing by saying I was a sickly man. He said he couldn't find the object I slipped on . . . He said, 'I don't believe you're so sick' . . . He had no right to tell me such a thing when I was in such a condition . . ." As the patient's expression of feelings mounted he complained more and more of pain in the back. When discussion was directed to pleasant topics the subject's pain and muscle tension subsided as he became more tranquil.

To take action is a basic component of the behavior of any individual. The reflex withdrawal of the hand from a source of painful stimulation is an example of the participation of skeletal muscles in behavior meant to protect the individual from noxious threats in the environment. There is abundant evidence dealing with the role of skeletal muscle activity in more complex patterns of behavior, such as the fight or flight response.[6-9]

Such common terms as "on guard," "angry," "competitive," and "apprehensive," all connote familiar patterns of behavior involving specific feeling states and muscular activity. The "on guard" tense pattern of behavior found in all of the patients in this series implies a constant state of readiness of the skeletal musculature to participate in impending action. Although it is not possible to delineate any specific personality type in the backache patients, still it is remarkable how many have depended on activity patterns involving vigorous muscle activity for their satisfactions. The women, for instance, in this series nearly all related memories of having been tomboys unusually interested in vigorous competitive play and sports.

If there is no specific personality configuration in these patients, still there is a specific attitude to the stressful circumstances precipitating their backache. The term *attitude* includes the way one feels about a situation and what one wishes to do about it. In these and other studies,[10] there exists a remarkable consistency of attitude in that all of them wanted to perform action involving bodily musculature, such as running or fighting, but all of them, because of the nature of their situation, were unable to act. Their drive to action was inhibited by others or by their own guilt and fears of retaliation or injury.

The next section summarizes investigations on the physiologic mechanisms through which the backache attitude ultimately leads to pain.

Mechanisms of Muscle Pain

Lewis and others[11,12] have demonstrated the crucial role of ischemia in the production of pain in such conditions as angina pectoris and intermittent claudication. Recent investigations of headache and backache syndromes have demonstrated that sustained skeletal muscle tension leads to pain, in the absence of pathologic involvement of either the blood vessels or the muscles.[1,13] The following experiments were undertaken then to evaluate the relationships of skeletal muscle activity and blood flow to the genesis of pain.

The experimental conditions have been described previously.[4] Briefly, they were as follows: The 10 subjects lay on a bed with the forearm comfortably extended. Skeletal muscle contractions were performed by squeezing with the fingers a rubber bulb attached by rubber tubing to a graduated mercury manometer. Muscle temperature was measured by copper-constantan thermocouple wires inserted in the 23-gauge needle placed to a constant depth of 20 mm. in the flexor forearm muscles. Circulation to the exercising forearm in some experiments was occluded by inflation of the sphygmomanometer cuff to pressures exceeding 200 mm. mercury.

Experiments were devised to compare the characteristics of pain produced in both rhythmic and sustained muscle contraction with circulation arrested and with circulation intact. Typical of the findings in a large number of experiments were the results obtained by comparing two strong sustained contractions of flexor forearm muscles, one performed with circulation arrested and the other done with the circulation to the arm intact. The contraction with circulation arrested was held for 150 seconds, at which time amplitude involuntarily fell. Pain commenced 32

seconds after the contraction experiment started and persisted until the circulation was restored by releasing the pressure in the sphygmomanometer. The amplitude of the strong contraction performed with circulation intact involuntarily diminished after 150 seconds, but could be maintained for another 10 minutes at a diminished level of contraction strength. Pain latency or the time from onset of the contraction until the appearance of pain was 55 seconds after the contraction began and persisted until the exercise ended.

The pain produced during the sustained contractions, as well as in strong rhythmic contractions with short rest pauses, was deep, dull, and poorly localizable and was experienced in the area of the active muscles. These observations indicate that rhythmic and sustained skeletal muscle contractions performed with intact blood flow are productive of pain with qualitative and quantitative characteristics indistinguishable from pain produced in muscles with arrested blood supply. To determine if the same basic mechanism of ischemia was present in sustained contractions, experiments were designed to use muscle temperature as an index of muscle blood flow during contractions. Immediately following onset of a contraction there was a fall in muscle temperature followed by a period of a plateau or slight increase in temperature.

Muscle temperature rose rapidly at the end of contractions and remained elevated for several minutes much in the same way that muscle temperature rises after the blood flow is restored to a previously occluded forearm. Using muscle temperature as an index of muscle blood flow, experiments were performed using rhythmic exercises in which brief periods of contraction lasting from 3 to 10 seconds were followed by rest pauses of equal duration. The finding of progressive increase in muscle temperature during rest periods and a relative diminution of flow during contraction periods is corroborated by similar results of others using plethysmographic methods of measuring muscle blood flow.[14]

Figure 2 illustrates the muscle temperature change during a strong sustained contraction of the flexor forearm muscles and also the plethysmographic changes determined by Grant in a similar exercise.[15] Pain began 45 seconds after onset of the contraction and mounted in intensity until the contraction ended. The disappearance of pain is related to the influx of arterial blood.

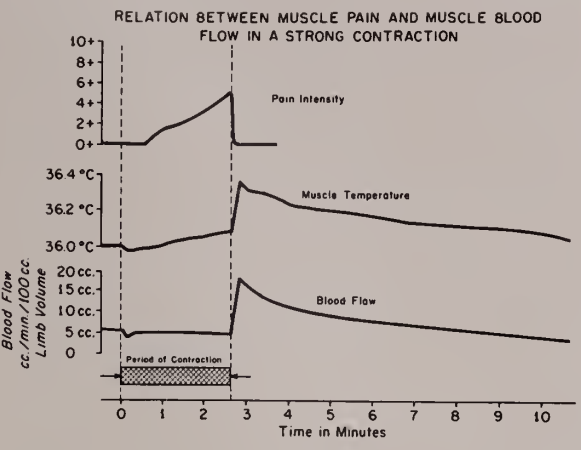

Fig. 2. Comparison of pain intensity, muscle temperature, and forearm volume changes (blood flow) during and following a sustained contraction of the forearm flexor muscles. Blood flow changes have been adapted from Grant.[15]

Skeletal muscle pain and tenderness predictably occur during the sustained and prolonged intermittent muscle contractions. The pain intensity and the pain threshold (the time interval between the start of contraction and onset of pain) are directly related to the strength of the muscle contractions. Compared with weak contractions, strong contractions are characterized by more intense pain and earlier onset of pain and by a marked influx of arterial blood to the relaxed muscle.

The peripheral mechanisms involved in the pain process relate to the circulatory and metabolic dynamics of skeletal muscle activity. Muscle contraction, by obstructing arterial flow, renders the muscle ischemic for the period of contraction. The degree of ischemia, as determined by a variety of blood flow experiments, is approximately proportional to the contraction strength. The increase in blood flow which accompanies muscle activity in ordinary kinds of exercise, such as walking, takes place during the relaxation periods between contractions. In a number of experiments involving measurements of muscle pain, fatigue, and blood flow, it was shown that the frequency and duration of rest pauses in intermittent contractions were critical factors. That is, fatigue and pain onset were earlier and pain was more intense when pauses were short and occurred infrequently. Thus, depending on the duration and frequency of rest pauses as well as the strength and duration of contractions, muscles may become relatively ischemic over a long time interval. The prolonged state of

anaerobic activity associated with sustained contractions is accompanied by shifts of electrolytes across the cell membranes and accumulation within the muscle of metabolic products which are dissipated in the presence of adequate blood flow and oxygen.

Lewis postulated that the factor responsible in ischemic muscle pain was a metabolite which he designated as Factor P.[11] Agents suggested to be Factor P included anoxia, acid metabolites (i.e., lactic acid), phosphoric acid, histamine, and potassium.[14] Of these, only potassium appears able to fill at least some of the conditions necessary for consideration as the pain factor.

Discussion

In addition to the emotional factors considered here there are, of course, a variety of illnesses and injuries which may precipitate the backache syndrome. Pain itself arising from structural disease, such as a herniated intervertebral disc, through local reflexes acts as a stimulus for muscle tension.[5] Figure 3 depicts the vicious

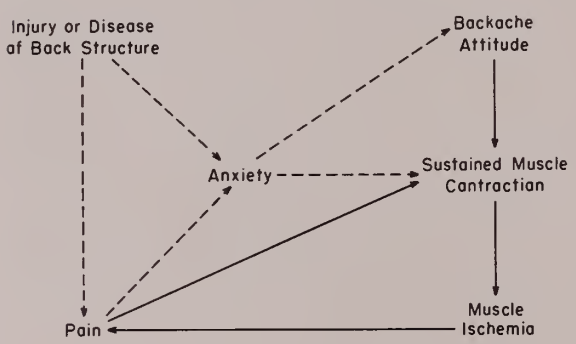

Fig. 3. Schematic representation of the interrelation of injury, disease and emotions in the backache syndrome.

cycle which may ensue when the pain caused by sustained muscle tension leads to greater muscle activity and in some individuals increased anxiety and conflict.

As a protective reaction pattern involving hyperfunction of skeletal muscles, the attitude which involves the readiness and desire to carry on movement of the entire body is well tolerated by the body for very brief periods of time. Difficulties ensue though when the patient is unable to complete the activity and instead maintains the sustained contraction until pain develops. Finally, then, the vicious circle is facilitated when the engendered somatic and psychic reactions become matters of concern and themselves further enhance and perpetuate the conflict.

Management

In an attempt to restore comfort and productivity to the patients with backache of muscle tension origin, a broad perspective must be taken in which the patient's many problems are considered as an interrelated whole. One must not think of the patient's illness in terms of either psychiatric or orthopedic disease, but consider that both factors are often combined and intertwined to produce the final clinical picture.[16] Management of the patient with emotional disturbances should include an attempt to deal with the personality features which bring about the muscle hyperfunction pattern. He should be allowed to ventilate his suppressed hostile and guilty feelings, and helped to understand for himself something of his own emotional reactions and attitudes. Treatment is sometimes complicated by lawsuits and litigation for compensation. In these people sometimes the wish to become well may be out-weighed by the secondary gains accruing from compensation and dependency needs. Experience has shown that an early cash settlement facilitates rehabilitation.

Essential, too, in management of backache, are measures which relieve pain, induce muscle relaxation, and improve blood flow. Physiotherapeutic techniques are helpful. Bed rest, although affording relief in many severe acute cases, may make some patients worse since confinement and immobility may be intolerable and the tension and pain enhanced rather than relieved. Travel and others have described techniques by which pain arising from trigger areas may be relieved by spraying with ethyl chloride spray, or local infiltration of tender areas with 1 per cent procaine.[17] Particularly useful in management of severe symptoms is intravenous sodium amytal (0.25 to 0.5 Gm.), especially when combined with psychotherapy. •

Time Is Running Out?

What an anomaly our American civilization presents! Here we are, a people who have invented and perfected more timesaving devices than Abe Lincoln could possibly have imagined while walking 12 miles to borrow an English grammar. Yet, never have so many complained so much about a lack of time to read, to think, to write, to reflect, to comprehend the economic and moral predicates on which a good society rests—indeed, to do any of the things that upgrade the mind and elevate the spirit.

Where does the time go? What's at fault here? Is it these timesavers or is it thee and me?

The mechanical dishwasher certainly qualifies as a timesaver. But install a glass door in it and then sit around watching its miraculous operation and little time would be saved for higher activities.

Television is a thing of wonder. One need no longer take the time nor travel the miles to see a football game, a play, a movie, a presidential inauguration, or numerous other events. Prior to the age of TV the obstructions of space and time served to limit our entertainment indulgences. But with the substantial removal of these obstructions many of us now use the saved time to more generously gratify our craving for the lighter pastimes.

The auto and the plane are timesavers as are tens of thousands of other modern inventions. But, for what worthy pursuits is all this time saved? These inventions *could* save time for the release of our creative energies, for study, for contemplation, for the realization of those higher potentialities peculiar to our individual persons. Timesavers can be employed to economize, to lessen drudgery, to free our higher selves from obstructions; *or we can use timesavers to multiply the ways we indulge ourselves.* It is a matter of personal choice. That many of us in our listening, our talk, in our cocktail parties, even in our reading, feed on the stuff that "waters the weeds of the mind" is an interesting commentary on how blessings can be maltreated.

There are reasons to believe that blessings cannot forever be abused in this manner. These blessings—these mechanical marvels we enjoy—have been made widely available with but minor effort on the part of each, such are the wonders wrought by a free society. If, however, the free society is perverted, if its delicate exchange of relationships are seriously impaired, these blessings can be lost as easily and as quickly as they appeared upon the American scene. But, unfortunately, those persons who refuse studiously to reflect on these problems can never have any awareness of this impending danger.

Time is not running out on us—any more than is the atmosphere. If we contaminate the air we breathe, have we a right to complain about the absence of fresh air? Time is in abundant supply; each day still has 24 hours. The fact that we use 140,000,000,000 man-hours annually to view TV and additional billions of man-hours for other forms of entertainment and indulgence is no basis for claiming a lack of time to educate ourselves. The plaint that "time is running out" has nothing to do with actual time supply. It has only to do with how we choose to use our supply of time.

Surgical Management of Otosclerotic Deafness

Malcolm N. Wilmes, M.D.
SPOKANE, WASHINGTON

Purpose of this brief paper is to report to physicians not specializing in otolaryngology what can be done in surgical care of deafness due to otosclerosis.

Any physician must suspect otosclerosis in those hard-of-hearing patients who present the following complaints or symptoms:

1. Deafness is insidious, usually beginning in the late teens. Progress of deafness is variable—in some quite rapid, in others so slow that a hearing aid is not required until middle age has been reached.
2. Hearing is better in noisy places. The patients hear well on the telephone and they hear well with a hearing aid.
3. Canals and ear drums are normal. Inflation of the eustachian tubes, either by the patient or by the physician, does not produce improvement.
4. The lower pitched tuning forks are heard longer by bone conduction than by air conduction.
5. The patients speak in a low voice. Some even whisper.
6. Medical treatment is of no avail.

In 1938 Julius Lempert presented a one-stage operation for relief of this type of deafness.[1] This procedure consisted in creating a window in the lateral semicircular canal through which airborne sound could pass to the cochlea, permitting the deafened to hear ordinary speech. Dr. Lempert's operation was not new. It had been tried in Europe with only occasional success for many years prior to 1938. The Lempert technique was the first practical one-stage operation and has given excellent results in about 80 per cent of the cases. This procedure is commonly known as the fenestration operation. Its chief drawbacks are:

1. A large cavity which needs life-time periodic attention remains in the operated ear.
2. The patient is disabled from three weeks to a month.
3. There is considerable vertigo during convalescence, and occasionally for years afterward on sudden movements of the head.

To one who has had his hearing restored by this procedure these travails, however, are minor.

In 1952 Sam Rosen revived a procedure, stapes mobilization, which had been attempted by Kessel 80 years ago.[2] In America between 1891 to 1893, Blake, Falk, and Burnert used stapedial mobilization without much success. As with any so-called new procedure or departure from the routine of 20 years, Rosen's work did not stir up much interest for some time. Stapes mobilization was not accepted by surgical otologists until two years after its reintroduction. By that time Rosen in this country, and his pupils in Europe and Israel, had done more than a thousand operations. Now widely practiced, the operation has been done in this country for several thousand

The stapes as viewed through an ear speculum showing the incision, the reflection of the tympanic membrane, the long process of the incus, the promintory and round window, the stapedial tendon, and part of the stapes.

This stapes shows fracture through the otosclerotic plaque which is anterior. As far as is known, these fractures do not heal, thus the stapes is capable of continued mobility.

patients. Early reports of success varied from 20 to 50 per cent. It seems to be established around 60 per cent at the present time.

Technique

The purpose of stapes mobilization is, as the name implies, to free up a stapes that has become locked in its oval window niche. Fixation occurs when otosclerotic plaques cover the foot plate of the stapes and prevent movements of the ossicular chain.

Using local anesthesia, the drum is elevated and the stapes exposed. A small portion of the bony posterior canal wall is removed for exposure of the stapedial tendon. One may visualize the incus, stapes, round window, promintory, and facial nerve covered by thin bone. A needle-like instrument is placed on the head of the stapes and moderate pressure is exerted. Only a touch is required to free the stapes at times. Some stapes are so firmly fixed that mobilization is not possible, as too much force will result in a fracture. Numerous other methods are being tried to free the stapes at the foot plate.

My own personal experience with 75 cases is as follows:

1. In 42 there was improvement to a practical level for hearing speech (30 decibels or better).
2. In 33 there was no improvement.
3. In 2 of the above there was additional hearing loss of 5 decibels.

Complications:

a. Serous Otitis—1
b. Otitis Media Suppurative—2
c. Perforation permanent—1 of above
d. Regression—none to date
e. Facial Palsy—none
f. Alteration of taste—occurred in several patients due to stretching of Chorda Tympani nerve. This annoys only those patients whose hearing has not been improved.

Conclusions

1. Mobilization is a simple, worth-while procedure for amelioration of otosclerotic deafness.
2. Results are not predictable. The surgeon so far has no real means of predicting final results from pre-operative examinations.
3. After failure, most cases may still be improved if the Lempert fenestration is employed.
4. Mobilization should be tried prior to fenestration surgery because of the minor nature of the mobilization procedure.
5. The mobilization operation, while simple, should not be attempted until the operator has had adequate training. Errors in technique can result in permanent perforation of the drum, paralysis of the facial nerve, labrynthitis or combinations of these unfortunate events. The result can be irrevocable loss of all hearing in the affected ear.•

Peritoneoscopy in the Study of Liver Disease

Eric R. Sanderson, M.D.
SEATTLE, WASHINGTON

Among the many problems that fascinate, puzzle and bedevil the physician, that of the differential diagnosis of liver disease ranks high.

Faced with a patient suspected of having liver disease, we proceed in an orderly fashion to fit the evidence together. We question; we examine; we order batteries of laboratory tests; we make x-rays. Then we correlate our data.

Usually, at this point, we can reach a conclusion. We can decide, for example, that one patient's jaundice is due, probably, to hepatitis, and that another probably has stones in his common duct. We can reason that a third patient's varices and ascites mean that he has portal hypertension from obstruction of the veins in the liver as a result of cirrhosis and that on the other hand, a fourth probably has extrahepatic obstruction because his liver has always functioned properly.

Most of the evidence we accumulate when we study liver disease indicates that certain functions of the liver are either normal or deranged. Most of our diagnoses, however, are anatomic diagnoses. They indicate pathologic anatomy rather than pathologic physiology. To convert physiologic evidence to anatomic conclusion, we must employ the process of reasoning. We must say that these changes in physiology usually are associated with those changes in anatomy and it probably holds true this time, too. Therefore, given this set of tests of function, we can conclude that such and such is the anatomic state of affairs. Then we have the diagnosis.

With a number of variables involved, it is apparent that there will be times when the deduced anatomic diagnosis is not the same as the actual anatomic diagnosis. There will be a certain margin of error. To reduce that margin of error to the absolute minimum, to put the diagnosis of liver disease on a firm anatomic footing, it becomes necessary to examine the anatomy of the liver. We would like to look at the liver both in its gross state and under the microscope. Often, to get information about the liver we would like to examine the gallbladder directly and by x-rays. Sometimes we would like to examine the spleen and, if possible, to make x-rays of the splenic and portal venous systems. Thus, by using any and all of the means for study we have at our disposal we can better determine the proper diagnosis, the prognosis and the treatment in this most difficult group of patients.

Available Methods

Three methods of examining the anatomy of the liver are in general use. The first of these, blind needle biopsy, has been practiced on the medical wards for a number of years. By a minimal procedure, it is possible to obtain a sample of the liver which may be of great help in making a definitive anatomic diagnosis. It is inexpensive, not time consuming and only slightly painful. On the other hand, it gives, at best, a tiny random sample of a very large organ. Taken blindly, the needle biopsy may not give a true picture of what is going on in the rest of the

liver. Disease in the liver may well be missed, as in patients with metastatic carcinoma. While the hazard is minimal, vital structures within the liver or in its neighborhood may be injured; every report of a large series of blind biopsies will include patients who come to grief as a result. Major vessels and major bile ducts have been injured with resulting hemorrhage or bile leakage.

At the other end of the scale from blind needle biopsy, there is laparotomy. Having proceeded to an end point from physiologic deduction and with the diagnosis remaining in doubt, prognosis and treatment cannot be outlined rationally. What is more natural under the circumstances than for the surgeon to want to make a small incision and take a look?

The small incision, made with local anesthesia, has the advantage of low morbidity and the disadvantage of low visibility. We can take a sample of part of the liver and look at the gallbladder and even do cholangiograms through the gallbladder if indicated. With the small incision, however, we can not examine the whole liver as well as we would like, and the small incision leads to an almost irresistible temptation to make a larger incision to get a hand in the abdomen and feel around. Then we have done a full scale laparotomy with its attendant morbidity in a group of patients often already seriously ill of their disease.

Advantages of Peritoneoscopy

Finally, there is peritoneoscopy, which is ideal in the study of the anatomy of liver disease. Utilizing the peritoneoscope, we are able to see the surface of both lobes of the liver, examine the gallbladder in a high percentage of patients, take specimens of the liver in the areas which appear involved by disease, inject radiopaque material into the gallbladder to visualize the biliary tree, and make splenoportograms by introducing a needle into the spleen under direct vision and injecting radiopaque material into the portal venous system.

We gain useful anatomic information by looking at the liver through the peritoneoscope. Size of the liver, its color, amount of fat present, degree of replacement by fibrous tissue, amount of gross liver necrosis, extent of regeneration, presence or absence of malignancy—all these serve to put the diagnosis of liver disease on a firmer footing. Excellent photographs of liver disease can be made through the peritoneoscope and are useful aids for teaching.

While looking at the liver, one can direct the Silverman needle to that part of the liver showing disease. At the same time, puncture of vital structures can be avoided. You can hit the places you want to hit and miss the places you want to miss. In metastatic malignancy, as an example, a nodule the size of a match head can be sampled for microscopic examination.

The consistency of the liver can be determined by the manner in which the needle cuts. The fatty liver of the alcoholic cuts like butter, it bleeds, and the needle hole collapses when the needle is withdrawn. Should it bleed longer than seems proper, the needle may be reintroduced into the hole and hemostasis awaited. The cirrhotic liver, on the other hand, cuts with difficulty. When the needle is removed there is minimal bleeding and the hole stays open like the hole on a golf green.

Usually the gallbladder can be seen at peritoneoscopy and excellent cholangiograms made by injecting radiopaque material into its lumen. Stones in the common duct, suspected by previous study but not proven, may be shown, or their absence may be demonstrated in patients suspected of having them. Thus the patient may be spared a more serious and costly operation.

My experience with splenoportograms has been nil. Kalk, who invented the peritoneoscope and who has used it in over 4,000 examinations of patients with suspected liver disease, has developed the technique of inserting a spinal needle into the lower pole of the spleen under direct vision, measuring the venous pressure in the spleen and injecting radiopaque material into the portal venous system to demonstrate, by x-ray, the presence of varices and the site of obstruction in the portal venous system. Information thus obtained is essential to a decision as to whether spleno-renal or portocaval shunts or neither, can be accomplished.

Complications

Nothing we do is free of complications, nor is peritoneoscopy. Kalk reports 5 complications in over 4,000 examinations, including bleeding, bowel perforation and air embolism. In my series, approximating one hundred, laparotomy was done once to arrest bleeding from the sur-

face of the liver which was injured during introduction of the scope, a technical error charged to early inexperience. One patient on whom cholangiograms were made by inserting a needle into the gallbladder, leaked bile on the night of peritoneoscopy. Cholecystostomy was done on the obstructed gallbladder. Aside from these there have been no major complications. Occasionally patients have shoulder pain and peritoneal irritation from air introduced into the abdomen or from bleeding. Rarely there may be subcutaneous emphysema which has not been cause for concern. That the morbidity is low is evidenced by the fact that over half of the patients reported here were discharged from the hospital the day after peritoneoscopy was done. Patients can be told with assurance that they may leave the hospital within 48 hours of the examination as far as peritoneoscopy and liver biopsy are concerned. Rarely has a longer period of convalescence from the examination been necessary.

All specimens obtained by needle biopsy under direct vision through the peritoneoscope were considered to be adequate for examination and no pathologist was unwilling to make a diagnosis because the specimen given him was not sufficient for examination.

The report of microscopic examination of biopsy specimens correlates closely with the diagnosis made on inspection of the liver through the peritoneoscope. In only two patients was there total disagreement. Once a specimen for biopsy was taken from the liver nodule which was obviously malignant on gross examination but microscopic examination showed no carcinoma in the tissue removed. The patient died later with metastatic carcinoma in the liver, so the error was one of missing the disease with the needle, as is so apt to occur with blind needle biopsy. The other patient's liver was greatly enlarged, was grey in color but showed no nodules; it was believed that no malignancy was present. Biopsy showed extensive involvement with carcinoma and he too died of his disease shortly thereafter.

The following reports illustrate the value of peritoneoscopy.

CASE REPORTS

Case 1. A 66 year old female had known gall stones for 20 years and a history of jaundice of three days duration. Extensive studies led to a diagnosis of parenchymatous jaundice, possibly associated with common duct stones. Peritoneoscopy was done in preference to laparotomy. The liver was small. Its surface was finely granular with small nodules of regenerating tissue. The needle introduced into the liver cut with resistance, characteristic of cirrhosis. Radiopaque material was injected into the gallbladder and three stones were visualized in the gallbladder by x-ray. The common bile duct was seen to be normal in size with no evidence of stone or obstruction (Fig. 1). Pathologic diagnosis was cirrhosis with associated hepatitis.

Fig 1. Cholangiogram through peritoneoscope showing stones in the gallbladder and a normal common duct.

Ths patient was spared the expense and danger of laparotomy, with an accurate diagnosis being made.

She died three months later. Autopsy diagnosis of portal cirrhosis with subacute hepatitis was made. The gallbladder contained three stones. The common duct was of normal size and no stones were present.

Case 2. A 55 year old female entered a hospital in July 1951 with a history of 18 months generalized malaise and weakness. Her liver was enlarged 4 cm. below the right costal margin and 6 cm. below the left. Red blood count was 3.3 million; hemoglobin 65 per cent; bilirubin 1.26 direct, 1.8 mg. total. Bromsulphalein retention was 24.4 per cent. Cephalin flocculation was 3 plus in 24 hours, 3 plus in 48 hours. Examination showed a mass in the rectal wall from which a biopsy specimen was taken. It was called atypical malignant lymphoma. She was treated for a year with x-ray therapy to the epigastric mass, presumed to be malignant lymphoma, but returned to the hospital in November 1952 with ankle edema, ascites, jaundice, and a large liver. Direct bilirubin was 3.3 mg., total 4.9 mg.; red blood count 3.4 million; hemoglobin 68.5 per cent; protein 7.2; albumin 2.3; globulin 4.9. Alkaline phosphatase 13 KA units; cephalin flocculation 2 plus in 24 hours, 3 plus in 48

Fig. 2. Cholangiogram through peritoneoscope showing dilated common duct with distal obstruction and stone at the junction of the cystic and common ducts.

Fig. 3. Cholangiogram in a cirrhotic patient suspected of having extrahepatic biliary tract obstruction. The gallbladder is normal. The common duct is normal in size and contains no stones. There is no obstruction.

hours. Peritoneoscopy in November 1952 showed a liver two to three times normal size with thickened edges and a grossly nodular surface, typical of Laennec's cirrhosis. Needle biopsy was taken. The pathologist's report was peri-insular cirrhosis.

The patient had a prolonged course following this examination. She eventually died as a result of cirrhosis two years later, having required multiple abdominal paracenteses. No evidence of lymphoma was ever found.

Earlier more critical evaluation of the cause of her enlarged liver would most certainly have contributed to her welfare.

Case 3. A 70 year old female was seen first in November 1955 because of jaundice. Studies indicated obstructive jaundice, cause undetermined. Peritoneoscopy showed the liver to be of near normal size and color, with no evidence of metastases. The gallbladder was collapsed and showed no evidence of bile in its lumen. A diagnosis of common duct obstruction proximal to the point of entrance of the cystic duct was made. The peritoneoscope was withdrawn and laparotomy carried out. A giant follicle lymphoma was found with complete obstruction of the common hepatic duct by a mass the size of a small orange. Choledochojejunostomy was carried out followed by radiation therapy.

In this instance, peritoneoscopy was done just prior to laparotomy to clarify the diagnosis and to determine whether more extensive surgery was indicated. Had she had extensive liver metastases from carcinoma, no laparotomy would have been done. The same principle has been applied to patients with carcinoma of the stomach to decide whether gastrectomy will be fruitless.

Case 4. A 67 year old male was referred with a story of increasing fatigue and a large mass in the right side of his abdomen, both having occurred over a three month period. His right eye had been enucleated eight years before, presumably for a tumor but the pathologic diagnosis was not known. Peritoneoscopy showed a tremendously enlarged liver with many small flat coal black nodules giving the gross appearance of melanomata. Biopsy specimens were diagnosed as metastatic malignant melanoma in the liver.

Conclusions

Peritoneoscopy in the study of liver disease gives information of great value in establishing diagnosis, prognosis and treatment. It is far superior to blind needle biopsy, yet only slightly more taxing on the patient's health and resources. Its morbidity is much less than that of laparotomy, yet the information obtained is considerably greater than in the small scale laparotomy and just as satisfactory as at full scale laparotomy.

Peritoneoscopy is as logical as other methods of endoscopic examination. By using it, the anatomy of liver disease can be correlated with the results of functional tests. Total evaluation of the status of the liver will help to establish the proper diagnosis, prognosis and treatment to the advantage of the patient and his physician.•

Evaluation of the Bentonite Flocculation Test in Rheumatoid Arthritis

H. Rowland Pearsall, M.D.
Henry Tesluk, M.D.
David W. Anderson, M.D.
C. L. Williams, M.D.
and
Dorothy Beggs, B.S.
Seattle, Washington

Recent biochemical and immunologic studies of the sera of patients with rheumatoid arthritis have resulted in a number of extremely interesting and exciting findings. It is now well established that such sera contain a factor which, in a high percentage of cases, agglutinates sensitized particles, such as bacteria, erythrocytes, collodion, latex, and other substances.

First clue to the presence of this factor was obtained by Cecil[1] in 1930. Waaler,[2] in 1940, first used sensitized sheep cells in the reaction. In the past 10 years, there has been increasing interest and effort by many investigators in various modifications of these serologic reactions. Rose, *et al.*[3] popularized the Waaler reaction in 1948 as a diagnostic test for rheumatoid arthritis. Heller, Jacobson, and Kolodny[4] in 1949 modified the Waaler-Rose test by absorption of the heterophil antibody of sera with packed sheep cell erythrocytes. Winblad[5] and Heller, *et al.*[6] demonstrated that certain sera had the property of inhibiting the sheep cell agglutination reaction, suggesting that certain gamma globulins were in competition with the sensitized sheep cells for the rheumatoid factor. As a result of this, it was observed that Fraction II of human sera could be attached to tannic acid treated cells[6] and to latex particles (Singer and Plotz),[7] and that these sensitized particles would react with the rheumatoid factor also. The method of Singer and Plotz utilizing the latex particles is a practical laboratory procedure and has been further modified by Rheins, *et al.*[8]

Ziff, *et al.*[9] made another interesting observation that the euglobulin fraction of many nonrheumatoid sera when allowed to react with a known positive rheumatoid serum inhibited the agglutination of sensitized sheep cells, whereas the same euglobulin fraction from rheumatoid sera did not inhibit the reaction. With this test, approximately 98 per cent of patients with definite rheumatoid arthritis gave positive reactions. This method, however, is technically difficult to do and has not been a practical one so far. Epstein, *et al.*[10] have shown that a precipitation reaction can be obtained between certain gamma globulins and the rheumatoid factor.

Experimental Findings

The experimental findings may be summarized as follows: (1) The serum rheumatoid activity (rheumatoid factor) resides in the globulin fraction and is not associated with the albumin proteins. (2) This rheumatoid factor is a large gamma globulin molecule with an ultracentrifuge sedimentation characteristic of 19-S as shown by Franklin and Kunkel.[11] (3) A second substance is also encountered in the gamma

Read before the Northwest Society for Clinical Research, Jan. 11, 1958, Vancouver, B.C.

This study was completed through the encouragement and financial support of the Virginia Mason Foundation.

globulin fractions of most normal individuals which interacts with the rheumatoid factor and can be employed in specific tests for it. This material has been called various names, depending on the methods employed in obtaining it, such as Fraction II (Cohn), euglobulin fraction, reactant, and inhibitor substance. Whether the small molecular 7-S gamma globulin, as described by Franklin and Kunkel, is the active material in all these globulin fractions is not certain at present. It appears to circulate in a loose complex with the rheumatoid factor when this is present. (4) The various methods of establishing the presence of the rheumatoid factor include agglutination of sensitized antibody coated cells, or particulate bodies, a precipitation reaction with gamma globulin, and the inhibition of agglutination by gamma globulins from certain normal sera.[5]

The exact antibody-antigen characterization of these reactions is obscure at this time. Indeed there is some evidence, such as the absorption of the rheumatoid factor by unrelated antigen antibody precipitates as shown by Vaughan,[12] suggesting the rheumatoid factor may actually be a kind of complement rather than a true antigen or antibody. Vaughan[13] has also recently shown that sera with low or absent gamma globulin fails to inhibit the rheumatoid agglutination reaction, and that inhibition activity is present in normal sera containing 7-S gamma globulin. In addition to this, Gofton, Robinson, and Thomas,[14] have found evidence that the rheumatoid factor apparently interacts also with polysaccharide components of joint fluid.

Interest in the rheumatoid factor exists not only because of its importance from a diagnostic standpoint, but also because of its possible role in the pathogenesis of the disease. There is a distinct possibility that intravascular reaction between the rheumatoid factor and the gamma globulin reactant might occur in the arteritic phase of rheumatoid arthritis.

Serologic Tests

The application of the serologic tests presently being used for rheumatoid arthritis in a general laboratory has been a difficult one. The modified sheep cell agglutination and the latex fixation test have proved the most useful to date. The sheep cell test is time consuming and not economically practical for most laboratories. The latex test has been satisfactory and can be completed in a few hours. Certain recent modifications of this test have made it more simple and practical.

Recently Bozicevich and Bunin[15] have described a simple, rapid method utilizing bentonite particles, sensitized with Fraction II, which can be completed in 20 to 30 minutes.

It is the purpose of this paper to present the results of the bentonite flocculation test in a series of 180 patients with rheumatic complaints. The study also presents a comparison of simultaneous determinations (on frozen serum) of the sheep cell agglutination test as modified by Ziff[9] and the bentonite flocculation test on frozen sera of 118 patients.

Methods

1. Sheep cell agglutination, Ziff modification. The serum is inactivated for 30 minutes at 56 C., and then adsorbed twice with packed cells (sheep) to remove the heterophil antibody. This is carried out for 1 hour at 37 C. Rabbit anti-sheep cell serum (amboceptor) is made up in dilutions of 1:100, 1:200, 1:300, and so forth. To this is added a 3 per cent sheep cell suspension. This will demonstrate the basic agglutination titer of the red cells. The sensitized sheep red cells are then prepared by mixing a 3 per cent suspension of the cells with amboceptor at 1/2 dilution of the basic agglutination titer, at 37 C. for 30 minutes. The sensitized sheep cells are then added to the adsorbed patient's serum in dilutions beginning at 1:14 and carrying through to 1:1792. The end point is clear cut as is shown in figure 1.

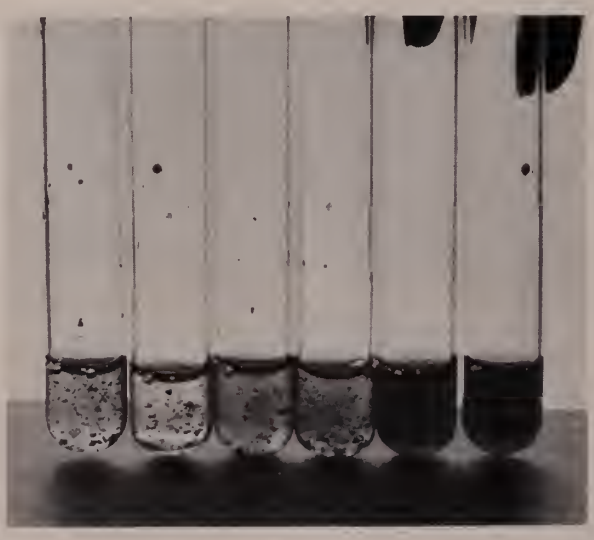

Fig. 1. Shows sheep cell agglutination reaction positive at a 1:56 dilution.

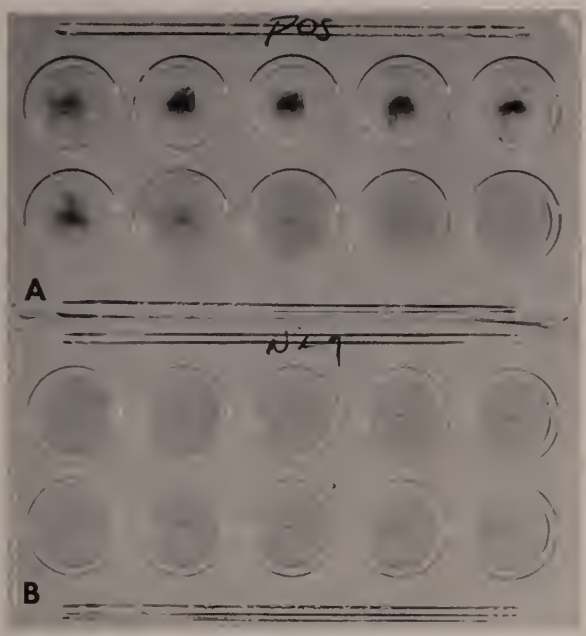

Fig. 2. Bentonite flocculation test: (A) Positive at dilution 1/128. (B) Negative reaction.

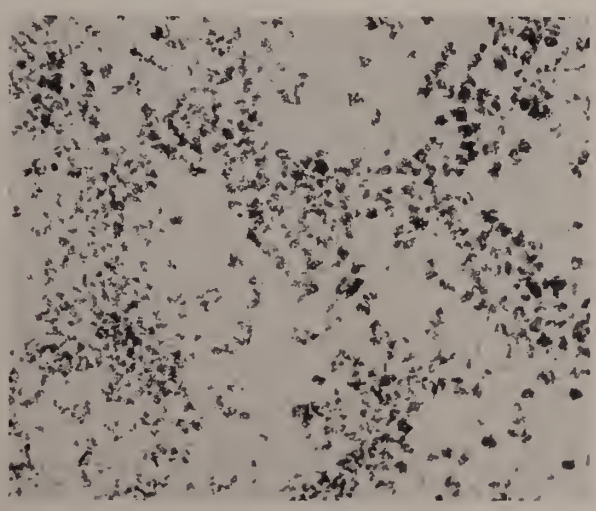
2. Bentonite flocculation test.

This test was done exactly as recommended by Bunim[16] and involves the use of sensitized bentonite particles obtained by mixing gamma globulin (Fraction II) with the bentonite suspension obtained by proper centrifugation (particles thrown down between the speeds of 1300 to 1600 r.p.m.), coloring the particles with methylene blue, and adjusting the *p*H to 7.3 along with the addition of Tween 80 as a wetting agent. This sensitized particle solution appears to be stable for at least 3 weeks, and when added to inactivated patient's serum, results in a flocculation reaction with certain rheumatoid sera. The test is set up in a standard 10 place serologic slide. Figures 2 and 3 illustrate details of the reaction.



The reaction is graded as 4+ with complete clumping, 3+ with 3/4 clumping, 2+ with 1/2 clumping, 1+ with 1/4 clumping, and 0 with all the sensitized bentonite particles in colloidal suspension. The serum dilutions are 1/2, 1/4, 1/8, 1/16, 1/32, 1/64, 1/128, 1/256, 1/512, and 1/1024. To be considered a positive flocculation test. a 2+ or stronger clumping must occur at a 1/32 or higher dilution.

Clinical Criteria

The patients in this series of cases with rheumatoid arthritis were selected according to the clinical criteria set up by the American Rheumatism Foundation. To be considered as having definite or unequivocal rheumatoid arthritis, the patient had to have at least five of the criteria summarized in table 1. Complete details in regard to these can be found in the report of the study group on rheumatic diseases.[17] Patients having less than five of the criteria were listed as either probable or possible. In this report it

Table 1. Clinical Criteria for Reumatoid Arthritis Set Up by American Rheumatism Foundation (Summary).

1. Morning stiffness
2. Pain & joint tenderness
3. Soft tissue swelling in one joint
4. Swelling in another joint in less than 3 mos.
5. Symmetrical joint involvement excluding terminal joints

was not worth-while from a statistical standpoint to separate these latter two groups.

Results

Table 2 shows the results of the bentonite flocculation-sheep cell agglutination comparison with simultaneous tests on 118 frozen sera. These

Table 2. Bentonite-Sheep Cell Comparison.

	Cases
Positive Correlation	114 (97.4% of total)
Sheep Cell +, Bentonite 0	3 (1 def., 1 def.+ Rh.Sp., 1 prob.)
Sheep Cell 0, Bentonite +	1 (pos. Rh., or Reiter's)
Total	118

results were obtained from both positive and negative sera of patients with rheumatoid arthritis and other rheumatic diseases. Purpose of this portion of the study was to compare the effectiveness of the bentonite test with the standard modified sheep cell test done in this laboratory. The bentonite test was in agreement with the sheep cell test, whether positive or negative, in 114 of the 118 cases. In 3 cases the sheep cell test was positive and the bentonite test was negative. In this group, there was one definite rheumatoid arthritis case, one definite rheumatoid arthritis plus rheumatoid spondylitis, and one probable rheumatoid arthritis. In only one instance was the sheep cell test negative and the bentonite test positive. This patient had possible rheumatoid arthritis or Reiter's syndrome.

Tables 3, 4, and 5 show the results of the bentonite flocculation test in the entire series of 180 patients with rheumatoid complaints. There

were 71 patients considered to have either definite, probable, or possible rheumatoid arthritis. One hundred and nine patients were considered to have rheumatic diseases other than rheumatoid arthritis. In the rheumatoid arthritis group, as shown in table 4, there were 35 who were in the definite unequivocal rheumatoid arthritis

Table 4. Rheumatoid Arthritis.

	Cases	%
Definite Group	35	
Positive Clinical Bentonite Correlation	27	77
Probable, Possible Group	36	
Positive Clinical Bentonite Correlation	11	30

group category. In this group of patients, 27 of the 35 had a positive clinical bentonite correlation. The probable-possible groups are listed together as these were all cases in which there were varying degrees of doubt as to the diagnosis of rheumatoid arthritis. There were 36 patients under the probable-possible group, with a positive clinical bentonite correlation in 11. This latter figure indicates that the test was of some help in approximately one out of three patients with suspected rheumatoid arthritis.

Table 5 lists the 109 patients with rheumatic diseases other than rheumatoid arthritis. In most

Table 5. Rheumotic Diseoses Other Thon Rheumotoid Arthritis.

Rheumotic Diseose	Coses	Results of Bentonite and Sheep Cell Tests
Osteoarthritis	29	All BTN tests 0 All SC tests 0

Tuberculous Arthritis	1	BTN 0
Malum Coxae Senilis	1	BTN 0

of these diseases an insufficient number of tests was done for any statistical significance to be attached to the results. However, in osteoarthritis there were 29 patients. In this group, all the bentonite tests were negative. In the other large group of patients with arthralgia, two positive reactions were obtained. In one of these, the bentonite test was positive and in the other, both the bentonite and the sheep cell test were positive.

Discussion

The results found in this series of patients add further supporting evidence that the bentonite flocculation test is a practical and reasonably

reliable procedure in the serologic testing of patients with rheumatic complaints. One of the most important findings in regard to the rheumatoid factor and serologic tests has been that false positive reactions rarely occur. The survey of 109 patients with rheumatic complaints resulting from diseases other than rheumatoid arthritis is certainly in agreement with the low incidence of false positive reactions observed by other laboratories. Admittedly, it would be extremely desirable for the test to be positive in a higher percentage of unequivocal rheumatoid arthritis cases. However, there are few tests in medicine that are this specific. It has been shown that certain modifications of the rheumatoid reaction, such as the inhibition test, will result in approximately 90 to 95 per cent clinical correlation with known rheumatoid disease. Such procedures have not been economically feasible or practical for most clinical laboratories. The bentonite modification, as described by Bunim, fits the criteria of a useful test. There are few clinical laboratory tests that are infallable and the bentonite test is no exception. However, when serum of a patient with rheumatic complaints contains the rheumatoid factor, one should consider that this patient has rheumatoid arthritis until proven otherwise. Bunim has also found the test positive in a significantly high percentage of patients with disseminated lupus erythematosus and scleroderma.[16]

It is now evident that positive reactions are more likely to occur in advanced cases, but have been reported at the onset of rheumatoid disease. In addition to this, the degree of agglutination is not necessarily related to the severity, or activity, of the disease as determined clinically. It is believed that the results in this series of patients are in general accord with those seen in similar larger series studied by other serologic types of rheumatoid tests.

Summary

(1) The bentonite flocculation test in this series of cases was as reliable as the modified sheep cell agglutination test. (2) The bentonite test is valuable clinically in the diagnosis of rheumatoid disease. (3) The test was uniformly negative in rheumatic diseases other than rheumatoid arthritis. (4) The test is considerably less time consuming than the sheep cell agglutination test and can be done as a routine test in rheumatic diseases. (5) The bentonite flocculation test was positive in 77 per cent of the definite rheumatoid arthritis cases. (6) The test was helpful in diagnosis of one out of three patients with probable or possible rheumatoid arthritis. •

Addendum

Hall, Mednis, and Bayles (New England J. Med. 258:731-735, April 10, 1958) have currently reported an extensive series of cases using a modified latex agglutination and inhibition reaction. This method appears a more practical one than the sheep cell inhibition test. The test is positive in over 99 per cent of known rheumatoid arthritis cases. However, it is a more complex procedure. It may be possible to adapt the bentonite test in a similar fashion.

Intravenous Use of Azacyclonol

Sol Levy, M.D.
SPOKANE, WASHINGTON

Physiodynamic therapies formerly referred to as the somatic treatment methods have opened a new era within the field of psychiatry. It is reasoned that the basic assumptions behind the physiodynamic therapies imply that mental disturbances are disturbances of the brain, and that their origin is to be sought in the physiopathologic, organic, sometimes histologic, and always endocrinologic and biochemical substratum of the phenomenon of consciousness. While for the past two to three decades the accepted theories among the so-called organicists in psychiatry have been that either coma or convulsions or both are necessary to treat or to influence the course of the major psychoses, more recently there has been a trend of broadening the therapeutic spectrum and a tendency toward the use of treatments less severe than generalized convulsions and deep coma. Several somatic modifications such as subcoma insulin, non-convulsive electric stimulation, carbon dioxide inhalations, and others, have been introduced, but the actual impetus of a drastic change came with the advent of pharmacotherapy. Through these new methods, it is now possible to investigate scientifically the physiologic mechanisms involved in severe mental illness and to develop a true laboratory background for therapeutic rationale.

During the past years many useful drugs have been introduced for treatment of the emotionally and mentally ill, and some of them have found a definite place in psychiatry. However, it must be mentioned that if any drug is to be considered of real value in the treatment of mental illness, it must be capable of relieving patients of the severe manifestations of such illness. Most particularly it should relieve the delusional and hallucinatory phenomena and the behavioral distortions which represent the sensory and motor aspects of mental illness, respectively. The effect on such manifestations must be of sufficient magnitude to represent large-scale social gains to the patient. Ideally, it should be effective, not only in psychotic states of recent origin, but also in those which have persisted over extended periods since it is these latter conditions which still represent the greatest challenge to psychiatry.[1]

Among the various groups of drugs introduced during the past few years, the tranquilizers are without any doubt the most popular and the most fashionable. These "happy pills" or "how-to-get-through-the-day pills" have been used extensively with more or less favorable results in so-called anxiety and tension states, and in various psychosomatic disorders but, with the possible exception of chlorpromazine, have had very little success in the major mental disorders. The mere fact that one day they are praised as miracle drugs and the next they are decried as dangerous and a threat to civilization itself makes their status rather confusing or even bewildering. They have undoubtedly broadened our therapeutic range and have certainly been a boon to mental hospital management. But they also carry with them certain disadvantages and dangers, not only in regard to inherent toxic manifestations. For instance, in tension states with depressive elements present, the so-called tranquilizers have definitely increased the depressive symptomatology, and in other cases

Read at the 1957 Western Divisional Meeting of the American Psychiatric Association at Los Angeles, California, November 22, 1957.

have tranquilized the patient into a dull emotional state rendering definite psychiatric treatment more difficult.

Central nervous system stimulants in the form of the so-called anti-depressants have also found a place among the pharmacologic agents in psychiatry since they can be used fairly sucessfully in mild to moderate depressive states when not accompanied by undue anxiety. On the other hand, cortical stimulants seem to help in certain mild confusion states among the aged but actually no specific drug, until now, has been introduced to combat successfully, and on a permanent basis, acute psychotic and acute confusional states, regardless of the underlying psychopathology.

This paper concerns itself with a drug which recently has been used successfully in the treatment of acute psychotic and acute confusional states. It acts not only by immediately removing the hallucinations, delusions and confusion—the "melting away of the psychosis" as Fabing put it —but also by permanently producing a state of relative calm in the patients. This removes the barrier between the physician and patient to make follow-up psychotherapy possible. It then becomes possible for the patient to gain deeper and better insight into his condition. This drug is azacyclonol,* still one of the most controversial and disputed products on the market today. It has been labeled as an "interesting" drug, as the "most powerful anti-hallucinogenic compound," as the "most disappointing" drug, and as the "most variable" drug. It is the gamma isomer of pipradrol.** Despite the structural resemblance between the two drugs pharmacologically, their actions are entirely different. While pipradrol, a clinical anti-depressant, increases psychomotor activity, azacyclonol decreases spontaneous activities, and among other properties is reported to block schizophrenic hallucinations and delusions. Also it is an effective blocking agent against the development of psychoses produced with lysergic acid diethylamide and mescaline. Fabing[2,3] in his pioneer work with this drug reported in several papers how azacyclonol, administered intravenously, abruptly ended an LSD-25 psychosis. When given orally for one week prior to experimental induction he was able to almost completely prevent an LSD-25 psychosis. The same holds true for mescaline-induced psychoses and dissociation reactions. Shortly thereafter reports of clinical trials with azacyclonol began to appear. Fabing[4] and his co-workers as well as other investigators[5-10] reported that it was valuable in treatment of acute schizophrenic psychosis in which delusions and hallucinations were predominant symptoms; in toxic and the postoperative psychosis; in senile psychoses with confusion, disorientation and hallucinations; and more recently also in chronic schizophrenia, especially with regard to delusions, hallucinations, ideas of reference, and behavior.

*Frenquel for this study was kindly supplied by R. C. Pogge of the William S. Merrell Company, Cincinnati, Ohio. Frenquel is the trademark of The Wm. S. Merrell Company for its brand of azacyclonol.

**Meratran is the trademark of the Wm. S. Merrell Company for its brand of pipradrol.

Material and Method

This study concerns itself with the use of intravenous azacyclonol in 30 private patients. Nineteen were males and eleven females. Their ages ranged between 14 and 86. In this group there were 8 with acute schizophrenic reactions, 4 of whom could be classified, using Meduna's term, as oneirophrenia; 4 schizo-affective reactions; 8 senile confusional states; 6 postoperative psychoses; and 4 toxic psychoses. The intravenous dosage ranged from 40 to 100 mg. every four hours. Duration of treatment was from a minimum of 48 hours to a maximum of 13 days with average of 5 days. Seven of these patients, after completion of the course of intravenous azacyclonol were placed on an oral maintenance dose of 40 to 50 mg. four times a day for several months.

It should be mentioned here that azacyclonol, both via the intravenous and the oral route, has been tolerated well by all patients. No serious side effects or physical or toxic complications were encountered in this study, except for the fact that some of the patients complained of an unpleasant and bitter taste while taking it orally. There was no evidence of a hypotensive effect.

Results

Twenty-six of the 30 patients in this study have responded extremely favorably to intravenous administration in the doses mentioned above. The best results undoubtedly were found among the group of senile confusional states, the postoperative and the toxic psychoses. In all these patients the confusion and disorientation as well as the hallucinations and delusions disap-

peared within a very short time after a course of azacyclonol had been instituted. Their behavior, which could best be described as agitated-bewildered, immediately started to return to normal. The drug certainly produced a dramatic "melting away" of the psychoses. Among the patients with acute schizophrenic reactions, intravenous azacyclonol also produced remarkable improvement but did so somewhat slower. In 4 patients with schizo-affective reactions, except for the agitation, it did not appear to be of therapeutic benefit.

Eight patients were diagnosed as having acute schizophrenic reactions. In these the schizophrenic break came rather acutely. All of them showed definite symptoms of detachment and feeling of unreality, with delusions, hallucinations and marked confusion. None of these patients had received treatment for this acute break other than intravenous azacyclonol. Three of these 8 were classified as catatonic excitement states. In all of them the drug relieved symptoms over a period of several days. The following case is characteristic for this group.

CASE REPORT

A 15 year old high school boy suddenly became extremely agitated, was unable to sleep, refused to obey orders, and became extremely preoccupied with religious matters. He had delusions and hallucinations and was confused. He thought his father was Christ, and complained of a floating sensation and a feeling of detachment. He heard voices of the Prophets who told him that he was singled out to spread the gospel of the Lord. Although there had been a positive family history (one paternal aunt had been in a state hospital with a diagnosis of schizophrenia) the boy had never shown any abnormal behavior and had never shown any evidence of mental illness. He was considered to be very conscientious and an above average student. He had taken part in social and group activities. The boy was hospitalized and intravenous azacyclonol was started immediately. He was given 60 mg. four times a day. Within a period of 48 hours he seemed calmed down, his agitation had subsided and the confusion cleared up gradually. However, he still seemed hallucinated and had delusions. Intravenous azacyclonol was continued at the same dosage for another four days, during which period his delusions and hallucinations subsided entirely. It was then possible to reach him through psychotherapy. He was placed on an oral maintenance dose of 40 mg. four times a day and has been able to return to school where he is adjusting satisfactorily. He is taking part in recreational activities and also is very active in outside group activities. He is being followed at regular intervals in the office, and thus far, after a period of over eight months, has not shown any recurrence of any psychotic symptoms.

Eight patients were diagnosed as having senile confusional states characterized by confusion, disorientation and hallucinations. In all these 8 patients, the drug relieved symptoms immediately.

CASE REPORT

A 68 year old female had always been a rather active woman, helping her daughter in the latter's real estate business. She had been answering the phone in the office, and had been able to talk and answer questions intelligently. About three months prior to hospitalization she started to become somewhat confused and disoriented. She gave wrong answers over the phone and her daughter felt that "she was slipping." She was first taken to a general practitioner who dismissed her case as the result of anteriosclerosis. Approximately two months later she became acutely hallucinated both in the auditory and visual fields. She thought that Hindus were coming to her home at night, that it was her duty to feed and house them, and she also, when watching Liberace on television, claimed that he was talking to her and that he told her that she should get married to him. She became rather agitated and irritable when contradicted in regard to her delusions. She was hospitalized and intravenous azacyclonol was started immediately with a dosage of 80 mg. four times a day. It was continued for four days during which time her marked confusion as well as her hallucinations disappeared entirely and there was no further evidence of motor agitation or restlessness. She has maintained this improvement for over ten months now and has returned to helping her daughter.

All 6 patients with postoperative psychosis received benefit from the intravenous administration of azacyclonol. Their behavior, too, was characterized by marked agitation, restlessness and confusion as well as delusions and hallucinations.

CASE REPORT

A 79 year old, retired railroad man who always had been in excellent physical and mental health, became extremely agitated several days following a prostatectomy. He was restless, confused, deluded and hallucinated, and showed verbal and physical assaultiveness. While at a general hospital he became most unmanageable and in spite of physical precautions was able to get out of bed, slipped, fell and broke a hip. Because of his mental state no therapeutic measures could be instituted. For this reason he was first referred for psychiatric treatment. Intravenous azacyclonol was started immediately at the rate of 100 mg. four times a day. Within a period of 48 hours his psychotic state subsided entirely so that orthopedic surgery could be performed. He was placed on an oral maintenance dose of 20 mg. four times a day for a period of three weeks thereafter during which time he remained at the hospital for recuperation. He was then discharged, returned to his home, and is not showing any evidence of recurrence of a psychotic state.

The same immediate improvement was noted in the 4 patients in the toxic psychosis group.

In one of these the psychosis apparently was produced by a combination of chlorpromazine and alcohol.

CASE REPORT

This patient, when admitted to the hospital, was extremely agitated and hyperactive. He was dehydrated almost to the point of exhaustion and collapse. He was extremely deluded, hallucinated and showed marked ideas of reference. Because of his dehydration, in addition to intravenous azacyclonol, intravenous fluids with high doses of vitamins and amino acids had to be given. After 36 hours, the patient's psychotic state subsided and it was then possible to start psychotherapy with him. He has maintained the improvement over a period of nine months, although at times he becomes rather tense and shows a tendency to drink. At no time has he shown any further evidence of psychotic reaction.

In the group of schizo-affective reactions, as mentioned above, the drug only relieved the motor behavior in the agitated patient. Basic schizophrenic mechanisms, since they were of longer duration, were not affected by its administration. At least in this latter group it did not seem to be of any material value.

Summary and Conclusion

Intravenous azacyclonol has been used successfully in 26 out of 30 patients reported in this study. It was most effective in senile confusional states, postoperative psychosis, toxic psychosis and acute schizophrenic reactions. It did not produce any material benefit in schizo-affective psychosis, except for removing the agitation. In the former group it not only removed the delusions, hallucinations, and confusion and returned the patient to his normal state, but it did so in a very short time. No side effects have been found, and it can be considered as a very safe drug which appears to be specific for the treatment of acute psychotic and acute confusional states, regardless of the underlying causes or psychopathology.•

Gastrointestinal Hemorrhage Cases at The Swedish Hospital, Seattle

Edward B. Speir, M.D.
SEATTLE, WASHINGTON
AND
Oscar K. Williams, M.D.*
ALBANY, OREGON

Gastrointestinal bleeding continues to be a major medical surgical problem. It would be difficult to find a single issue of one of the major surgical journals which does not carry at least one article on bleeding from some portion of the intestinal tract. The appearance of blood or bleeding is one of the general basic surgical pathologic entities—i.e., hemorrhage, obstruction, perforation. Hence it is an ever present threat or entity.

The purpose of this paper is to present a statistical review to show the number of cases of gastrointestinal hemorrhage admitted to The Swedish Hospital from 1952 to 1955, location of the lesion, method and accuracy of diagnosis, management, mortality, and comparison of similar studies made in other hospitals.

The material for this study includes 303 cases diagnosed "gastrointestinal hemorrhage" on the front sheet of the chart regardless of whether it was a massive, obscure, or recurrent hemorrhage.

Table 1 shows the breakdown of males and females in their respective diagnoses as to etiology and site. It is seen that males are afflicted in a ratio of three to one with females for duodenal ulcer, one and one-half to one for gastric ulcer, and three to one ratio for gastrointestinal hemorrhage site unknown. Although the number of cases are few, it is interesting to note that in this study females outnumbered the males in esophageal varices by a ratio of two to one. Diaphragmatic hernia, gastritis, and ulcerative colitis also were diseases which favored the female by a ratio of two to one. The remaining sex distribution showed no real favoritism. The miscellaneous group, totaling 12, included 1 case of leiomyoma of the stomach, 1 case of acute indigestion, 1 case of a bleeding ulcer of the rectum, 2 cases of leukemia, 1 of Hodgkin's Disease, 1 with dicumarol intoxication, 1 with periarteritis nodosa, 1 with polycythemia vera.

Table 1. Sex Distribution as to Etiology and Site of Hemorrhage.

Diagnosis	Males	Females	Total
Duodenal ulcer	101	34	135
Gastric ulcer	29	19	48
Gastrointestinal hemorrhage site unknown	35	14	49
Esophageal varices	3	7	10
Diverticula of the colon	5	4	9
Diaphragmatic hernia with ulceration	2	6	8
Gastritis	2	6	8
Ulcerative colitis	2	5	7
Carcinoma of the rectum	1	3	4
Carcinoma of the stomach	1	3	4
Gastrojejunal ulcer	3	2	5
Esophageal ulcer	2	2	4
Miscellaneous	5	7	12
Total	191	112	303

Figure 1 indicates the age distribution for those treated medically and those treated surgically. For this chart only those patients with duodenal ulcer, gastric ulcer, and gastrointestinal hemorrhage sites unknown were used. These three groups comprise 72.5 per cent of the total number of cases. Since the ages are grouped in decades the remaining cases were too few in number to alter the curve.

From this curve, as might be expected, patients, both male and female, are more com-

Read before the North Pacific Surgical Association, Vancouver, B.C., Nov. 15-16, 1957.
*Formerly surgical resident at The Swedish Hospital, Seattle, Wash.

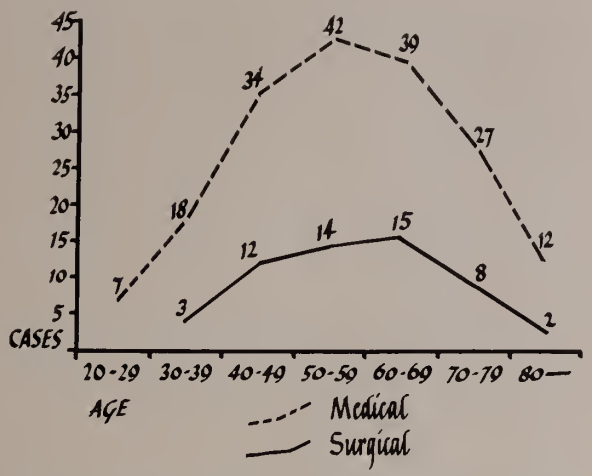

Fig. 1. Age distribution of patients treated medically and surgically.

monly afflicted with gastrointestinal hemorrhage in the sixth and seventh decades of life. The variance of the curve between those treated medically and those treated surgically is slight and thought to be of no significance.

Figure 2 is a schematic drawing of the gastrointestinal tract indicating the various sites of the lesions responsible for the gastrointestinal hemorrhage. The further breakdown of the number of cases and percentage of total for the various sites are as follows:

Table 2. Case Distribution os to Site of Hemorrhage.

Site of Lesion	Cases	%
Duodenal ulcer	135	44.6
Gastric ulcer	48	15.8
Gastrointestinal hemorrhage site unknown	49	16.1
Esophageal varices	10	3.3
Diverticula of the colon	9	3.0
Diaphragmatic hernia with ulceration	8	2.7
Gastritis	8	2.7
Ulcerative colitis	7	2.3
Carcinoma of the rectum	4	1.3
Carcinoma of the stomach	4	1.3
Gastrojejunal ulcer	5	1.6
Esophageal ulcer	4	1.3
Miscellaneous	12	4.0
Total	303	100.0

The miscellaneous group is the same as quoted in the paragraph on sex distribution.

At a glance it is thus seen that 72.5 per cent of all cases of gastrointestinal hemorrhage in this series were located between the lower esophagus and the ligament of Treitz. Seven per cent were located between the ligament of Treitz and the rectum. Unknown sites account for 16.1 per cent, and the miscellaneous group was 4 per cent of the total.

Pinpointing a lesion responsible for gastrointestinal hemorrhage is not always easy, for if an attempt is made at the time of acute bleeding the lesion may be obscured by the presence of blood. Under such conditions the radiologist feels that he has a 50 per cent chance of finding the lesion; if the examination is put off until

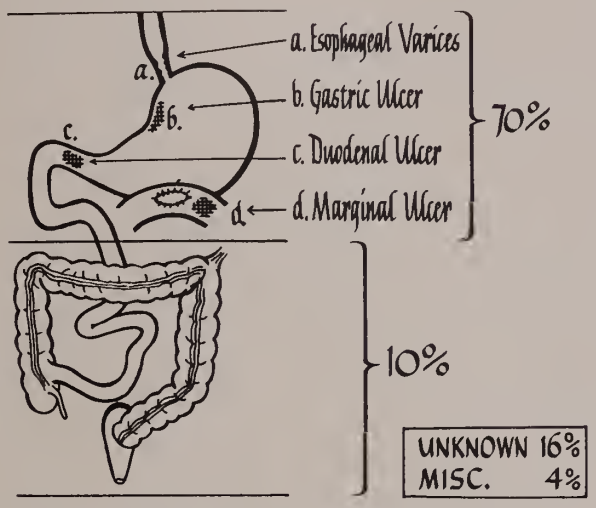

Fig. 2. Schematic illustration showing sites of hemorrhage.

bleeding has completely subsided, many times the lesion will have healed or have become so small that it is impossible to demonstrate. The history and physical examination give some indication as to site of the lesion; if hematemesis is the chief symptom, the lesion is usually in the upper portion of the gastrointestinal tract. If melena is the chief complaint, the lesion is in the distal portion. There are always exceptions to this rule of thumb. In addition to history and physical examination, other diagnostic measures utilized were x-ray studies of the upper and lower gastrointestinal tracts, esophagoscopy, and gastroscopic examination.

Table 3 is self explanatory in revealing the accuracy of diagnosis.

Table 3. Accuracy of Diagnosis.

Method of Diagnosis	% of Accuracy
1. Positive x-ray or endoscopy or both	80.7
2. Positive x-ray with no lesion found at surgery	3.2
3. Negative x-ray with positive lesion found at surgery	7.7

The remaining 8.4 per cent were treated without hospital x-ray, endoscopy or surgery.

Of the 303 patients in this series, 235 were treated medically and 68 were treated surgically. The overall operative rate was 22.4 per cent. Of the 235 treated medically, 10 had been treated previously by surgery. Table 4 is a further analysis of the division between medical and surgical treatment.

Table 4. Distributian of Medical and Surgicol Treotment.

Site of Lesion	Treated Medically	Treated Surgically
Duodenal ulcer	110	25
Gastric ulcer	37	21
Gastrointestinal hemorrhage site unknown	43	6
All others	45	16

The average number of transfusions for those patients treated surgically was 8, whereas for those treated medically it was 2.6 units. Of those patients treated surgically, 72.1 per cent had two or more admissions for gastrointestinal hemorrhage. Of the surgically treated patients, 82 per cent were not bleeding at time of surgery, whereas 18 per cent were still bleeding. In this series no blind gastric resections were recorded. Blind gastric resection was defined as the case of gastrointestinal hemorrhage in which history, physical examination, x-ray or endoscopic examination or both revealed no evidence of the site of bleeding and at the time of surgery no lesion was found, but a gastric resection was carried out.

There were 31 deaths in the series with an overall mortality of 10 per cent. On the medical service there were 21 deaths with the medical mortality being 8.9 per cent. Of the 68 surgically treated patients, there were 10 deaths with a mortality of 14.7 per cent.

Figure 3 shows the medical and surgical mortality by decade, the surgical mortality being greatest in the eighth decade whereas the medical mortality is spread out between the fifth and ninth decades. On the medical service, of the 21 deaths, 13 were due to exsanguinating hemorrhage, or 62 per cent of the medical deaths were due to hemorrhage. Esophageal varices and cirrhosis accounted for 2 deaths; peptic ulcer, 3; gastrointestinal hemorrhage site unknown, 2; malignancy, 3; miscellaneous, 3; and deaths from other causes, 8.

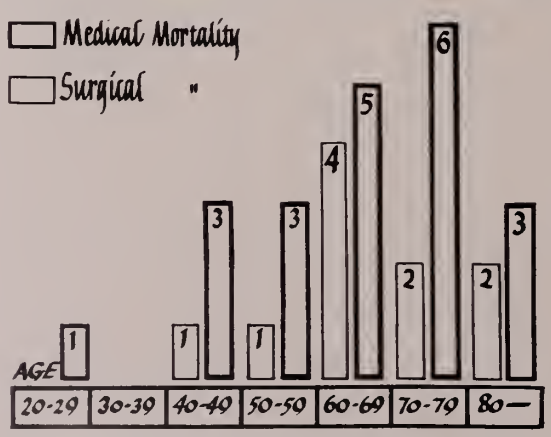

Fig. 3. Medical and surgical mortality by decades.

Tabulation of the number of admissions of these deceased patients revealed that 7 had been admitted once; 6 had been admitted on 2 previous occasions; 4 had been admitted 3 times previously; 3 had been admitted on 4 previous occasions; and for 1 patient the number of previous admissions was unknown.

In this same group of patients, 15 had evidence of only 1 previous hemorrhage, 3 had evidence of 2 previous hemorrhages, while 1 had 3 previous hemorrhages, and for 2 the number of previous hemorrhages was unknown.

On the surgical service, of the 10 deaths there were 3 which were due to exsanguinating hemorrhage, or 30 per cent of the deaths on the surgical service were from this cause. These 3 deaths were due to hemorrhage from peptic ulcer (either duodenal or gastric ulcer). The deaths due to other causes were 1 case from gas bacillus infection, 1 from a malignancy of the stomach, 1 from pulmonary embolus, 1 from cerebrovascular accident, 1 from renal failure and pseudomembranous enterocolitis, and 1 due to acute pancreatitis. Six of these patients had been admitted only once to the hospital, whereas 2 had been admitted on 2 previous occasions, 1 had been admitted 4 times, and 1 had 8 previous admissions. Hemorrhage had occurred once in 7 of these patients, 1 had 4 hemorrhages, and 1 had 8, and 1 an unknown number of hemorrhages.

Brick and Jeghers, from the Department of Medicine of Georgetown University Hospital, published a composite review of gastrointestinal hemorrhage.[1] The following is a comparison between their findings and those of this study.

Site of Lesion	Swedish Hospital %	Brick and Jeghers Study %
Gastrointestinal bleeding site known	83.6	85
Gastrointestinal bleeding site unknown	16.4	15

Our findings are similar to Loe's study published in July 1950.[2] He reviewed 94 cases of massive gastrointestinal hemorrhage between

1943 and 1949. In his series 73 per cent were due to various types of ulcers—duodenal, gastric, marginal, and diaphragmatic hernial ulcers; 27 per cent were due to varices, carcinoma, hemorrhage of site unknown, and miscellaneous. The overall mortality rate in Loe's study was 9.57 per cent.

Since completion of this study, 3 patients have had blind subtotal gastric resections for bleeding. We have no quarrel with this method of handling the problem provided the patient has been carefully and thoroughly explored, including the use of a sterile sigmoidoscope, before the surgeon makes the decision.

Conclusion

Gastrointestinal bleeding is a major medical-surgical problem. Of the 21 medical deaths, 13 or 62 per cent were due to exsanguinating hemorrhage; of the 10 surgical deaths, 3 or 30 per cent were due to exsanguinating hemorrhage. Of the 12 patients operated upon while bleeding, 3 or 25 per cent died from hemorrhage.

A diagnosis as to the site of hemorrhage can be made from the history, physical examination, and existing diagnostic procedures short of laparotomy in 80 per cent of the cases. Stabilization of the patient bleeding from the gastrointestinal tract is desirable and can be obtained in four out of five cases.

Of all bleeding, 75 per cent occurs between the lower esophagus and the ligament of Treitz.

Mortality for the disease increases with the age of the patient. •

1445 Medical-Dental Bldg. (1) (Dr. Speir).

Medical Mahomets Go to the Mountain

An effective method of attacking the tough problem of maintaining personal contact, communications, and understanding between the state association and component county medical societies is now being used in Georgia.

The council of the Medical Association of Georgia is working under the concept that "if the mountain will not come to Mahomet, Mahomet will go to the mountain."

The council is now holding each of its regular quarterly meetings in a different city in the state. Members of the local and surrounding county societies are invited to attend these sessions to see at first hand the multiplicity of problems, complexity of the subjects, and the tremendous amount of work being done by the state officers and council.

"Too many doctors are extremely busy and have little time for reading," said Hal M. Davison of Atlanta, immediate past-president of the state society. "Our plan of moving the council meeting around the state is one of the best ways we have ever found to collapse distances and differences, thus avoiding misunderstandings between the state organization and the individual physicians of a county medical society."

SYNTHETIC BILIARY ABSTERGENT

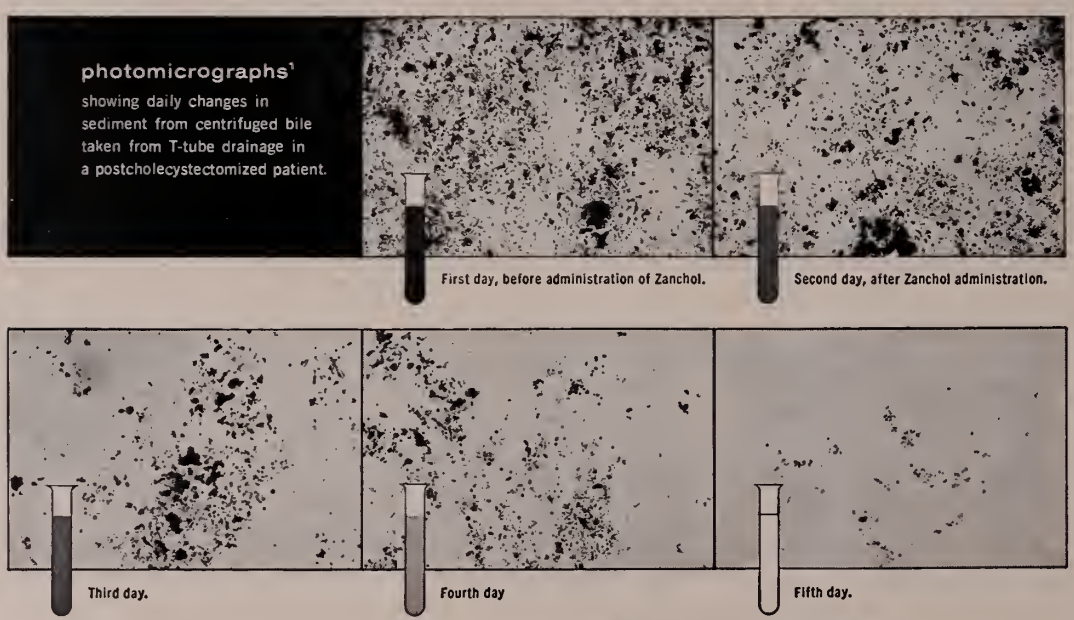
ZANCHOL®

(brand of florantyrone)

Fills an Important Postcholecystectomy Need

The excellent results with Zanchol in patients whose gallbladders have been removed have been most pronounced in two phases of management:

1. Early—Zanchol in Postoperative Care. T-tube studies have demonstrated that Zanchol increases the volume and fluidity of bile, at the same time changing its color to a clear, brilliant green. The greatly improved abstergent cleansing action of the bile is noted in its ability to keep the T tubes clean[1] without rinsing in most cases.



2. Late—Zanchol in Postcholecystectomy Syndrome. By improving the physicochemical properties of bile and increasing its flow, Zanchol acts to eliminate biliary stasis and sharply reduce or eliminate biliary sediment. The drug may be employed in both prophylaxis and therapy of the postcholecystectomy syndrome.

Medical Indication for Zanchol
This includes the treatment of patients with chronic cholecystitis for which surgery is not required or may be impossible for any reason.

Dosage: one tablet three or four times daily. Tablets of 250 mg. each.

G. D. Searle & Co., Chicago 80, Illinois.

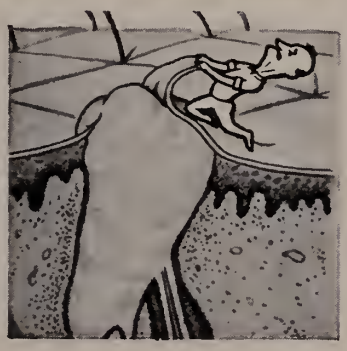
SEARLE

IN ACNE

Fostex® degreases the skin and helps remove blackheads



Fostex contains a combination of surface active agents (Sebulytic*) which:

◂ Completely emulsify excess oil so that it is quickly washed off the skin.

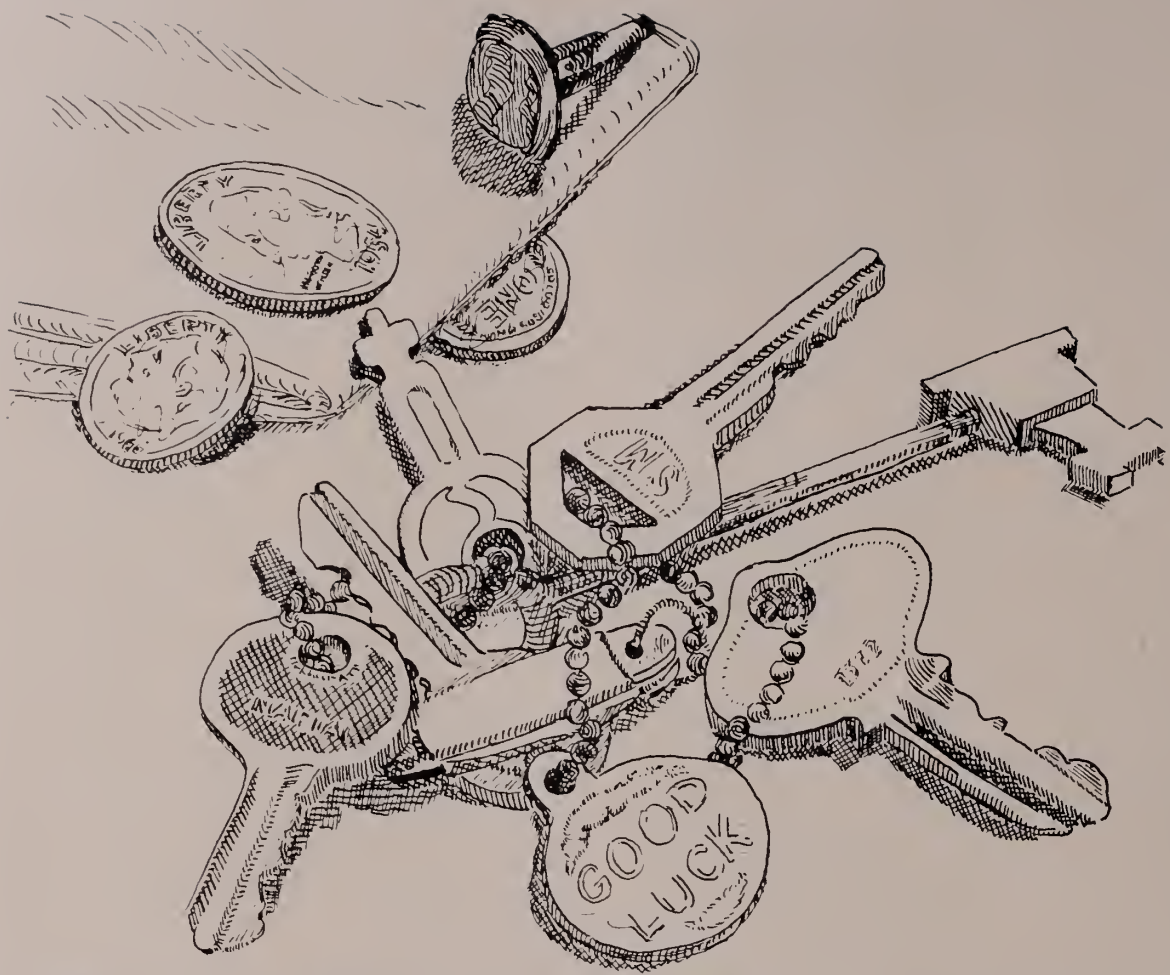
◂ Penetrate and soften comedones, unblocking the pores and facilitating removal of sebum plugs.

Fostex dries and peels the skin

◂ The Sebulytic base of Fostex dries and promotes peeling of the skin . . . actions enhanced by the keratolytic effects of micropulverized sulfur and salicylic acid.

*(Sodium lauryl sulfoacetate, sodium alkyl aryl polyether sulfonate, sodium dioctyl sulfosuccinate.)

FOSTEX CREAM
for therapeutic washing of skin in the initial phase of acne treatment, when maximum degreasing and peeling are desired.



FOSTEX CAKE
for maintenance therapy to keep skin dry and substantially free of comedones.

Fostex is easy for your patients to use

◂ Patients stop using soap on affected skin areas. Instead they use Fostex for therapeutic washing of the skin. The Fostex lather is massaged into the skin for 5 minutes—then rinse and dry.

More Than A Necessity

A KEY CHAIN carries a variety of items needed to perform many varied tasks met with every busy day. Added to the necessity of having each item available is the greater value of holding them together in one convenient cluster. Centralization in a hospital, too, is more than just a necessity. To its users, a hospital gains an added luster of convenience when it brings together all the items necessary to deal with a specific problem. Such a hospital is Shadel. In dealing with one, and only one problem—alcoholism—Shadel provides complete care for the patient during confinement, supervises rehabilitation, and at the same time gives him the benefit of its modern research program. Care, supervision, and research—all necessities in dealing with alcoholism—conveniently provided in one operation, Shadel.

The safe, physiologic potentiation of

GLUCOSAMINE†

now also available in two other outstanding Pfizer antibiotic agents used in your practice...

Glucosamine, a physiologic absorption-enhancing agent, is chemically an amino sugar, 2 amino d-glucose, $C_6 H_{13} NO_5$.

Enhancement studies involving 84 adjuvants and 30,000 blood level determinations revealed glucosamine as the enhancement agent of choice for both tetracycline and oxytetracycline (Tetracyn®and Terramycin®). Not only did glucosamine considerably increase antibiotic blood levels, but it produced these higher blood levels more consistently in crossover tests. And, importantly, glucosamine has no adverse effect in the human body.

Glucosamine is a normal physiologic metabolite that is found widely in the human body. Glucosamine does not irritate the gastrointestinal tract; it is sodium free and releases only four calories of energy per gram. Further, there is evidence that glucosamine may influence favorably the bacterial flora of the intestine.

AT LAST—A NIPPLE THAT NEWBORN BABIES

New *Curity** Rib Nipple

(PATENTED)

reduces air swallowing

Scientifically designed to fit baby's mouth—new hollow side ribs provide continuous flow of formula.

For generations, doctors have sought a nursing nipple that would reduce air swallowing . . . a nipple that would not collapse, but instead would permit a continuous flow of formula.

Here at last is such a nipple. It is like no other nursing nipple available up to now.

The *Curity* Rib Nipple is the result of years of development and hundreds upon hundreds of clinical tests with normal and hard-to-feed babies. It has been heartily endorsed by obstetricians and pediatricians. Mothers who have used it overwhelmingly prefer it.†

Hollow side ribs make feeding *easier* because:

- they provide continuous flow of liquids even when baby bites
- they fit the corners of baby's mouth, reducing air intake
- they permit use of naturally pliable rubber—more like breast feeding—requiring less effort yet providing adequate sucking exercise.

*T. M. The Kendall Company

When to recommend this nipple:

1. For new babies
2. For supplemental feedings of water and orange juice to breast-fed babies
3. For converting breast-fed babies to bottle
4. For problem feeders

IN DIABETES

Blood Cholesterol Regulation Is Desirable

Frequently, diabetes mellitus is associated with excessive coronary atherosclerosis and heart disease. It is also well recognized that vascular disease manifests itself at an earlier age and progresses more rapidly in the diabetic . . . especially the diabetic female. The early onset and severe degree of atherosclerosis may be due to faulty lipid metabolism, with a concomitant elevation in blood cholesterol levels. Kinsell[1] reports that even in diabetics with extensive vascular disease it is possible to produce normal cholesterol levels with an essential fatty acid emulsion.

The consensus of opinion today is that elevated cholesterol levels should be reduced or prevented. This can be done very well by the addition of adequate amounts of linoleic acid and vitamin B_6 to the diet. In scores of diabetic patients, with extensive vascular disease, diets high in linoleic acid resulted in improvement.[2,3] Vitamin B_6 apparently is necessary to convert linoleic acid into the primary essential fatty acid, arachidonic acid. Thus the body is dependent on an intake of both linoleic acid and vitamin B_6 for normal cholesterol levels.[4,5]

This is why ARCOFAC (Armour Cholesterol Lowering Factor) provides *both* linoleic acid and vitamin B_6 in adequate amounts, thus allowing the patient to eat a balanced, nutritious and palatable diet. Prophylactic dosage is 1-2 tablespoonfuls daily; therapeutic—2-8 tablespoonfuls daily.

Each tablespoonful (15 ml.) of Arcofac emulsion contains:

Essential fatty acids†.....6.8 Gm.
(measured as linoleic) with 2.5 I.U. of Vitamin E*

Pyridoxine hydrochloride
(Vitamin B_6).....1.0 mg.

†Supplied by safflower oil which contains the highest concentration of polyunsaturated fatty acids of any commercially available vegetable oil.

*Added as Mixed Tocopherols Concentrate, N.F.

OREGON STATE MEDICAL SOCIETY
1115 S. W. Taylor Street
Portland 5, Oregon

ANNUAL MEETING
September 3-5, 1958
Portland

President, Vern W. Miller, M.D., Salem
Secretary-Treasurer, Max H. Parrott, M.D., Portland
Executive Secretary, Mr. Roscoe Miller, Portland

Comittee on Traffic Safety To Study Physical Standards for Drivers

After some months of research and discussion of broad principles, the Oregon State Medical Society's Committee on Traffic Safety announced plans in April to conduct an extensive study which could lead to the legal establishment of physical standards for automobile drivers.

Chairman Arthur A. Fisher of Salem further reported that the Cornell Automotive Crash Injury Research Institute completed a six-month study in North Central Oregon and shifted the investigation on April 15 for the next six months to Yamhill, Lane, Tillamook and Clatsop counties. The survey has been approved by the State Society.

Recognizing that physical standards for automobile drivers should vary according to age and occupation, the Committee accepted an invitation from the Oregon State Board of Health to open its studies with consideration of the single problem of what constitutes adequate physical standards for school bus drivers.

At the present time a professional driver operating within the borders of the State is only required to secure a chauffeur's license which does not include a physical examination.

Age, experience and physical condition of school bus drivers apparently varies widely throughout the State. In some areas, college students are employed to transport youngsters to and from the school house. Other school boards employe independent contractors, who, in turn, hire professional drivers. In some smaller districts a local farmer, teacher or businessman might handle the driving chores.

Purpose of the study is to recommend preliminary physical standards for school bus drivers. These standards would be approved on a temporary basis for the 1958-59 school year. During the next 12 months the Committee may develop permanent physical standards for school bus drivers and possibly recommend a uniform physical examination form to be completed by the attending physician.

Later the Committee plans to consider physical standards for other occupational drivers and might also survey physical requirements for private motorists, Chairman Fisher reported.

A traveling team of physicians, Cornell Institute representatives, police and traffic safety personnel visited the new four-county auto crash injury study area the week before the start of the survey. Briefing sessions were held with physicians, hospital administrators, state patrolmen and coroners in McMinnville, Tillamook, Eugene and Astoria.

The study covers only those accidents with injuries which occur on state highways. Patrolmen are trained to complete a special report on each accident and physicians are requested to fill out a simple medical report on each accident victim. Reports are forwarded to the State Board of Health. Medical reports and the police report on each accident are than sent to the Cornell Research Institute.

Participants on the pre-study tour included E. N. McLean, Oregon City, a member of the Committee on Traffic Safety; Richard H. Wilcox, State Board of Health; Mr. Max deNovellis, Cornell University Medical College; Mr. Ed Warmoth, and Mr. Charles Boice, State Traffic Safety Commission and Lieutenant Byron Hazelton of the State Police.

Eastern Oregon District Medical Society Plans Annual Session for Ontario June 6-7

Joseph T. Burdic, Ontario, president of Eastern Oregon District Medical Society, is now developing the scientific program for the Society's 1958 Annual Session in Ontario on Friday and Saturday, June 6 and 7. Dr. Burdic states that the program theme will be "Trauma."

Six guest speakers in the fields of medicine, orthopedics, plastic surgery, chest surgery, neurosurgery and general surgery will present papers. Discussion time will be provided by means of round-table panels comprised of the guest speakers.

Business session of the Society will be conducted at lunch on June 6 which will also be the day of the annual banquet.

Eastern Oregon District Medical Society is composed of the physicians in Oregon's eight eastern-most counties: Umatilla, Morrow, Union, Wallowa, Baker, Malheur, Grant and Harney. It serves as the component for the physicians in Morrow, Wallowa, Grant and Harney counties.

Dr. Burdic asks that all members make plans to attend. Programs and reservation forms are being mailed early in May. He states, also, that a cordial invitation is extended to the physicians in Southwest Idaho and Southeast Washington.

Dr. Burdic adds that the meeting will close at noon on June 7, thus giving members an opportunity to take advantage of the excellent recreational opportunities in the Snake River country.

Postgraduate Course in Athletic Injuries Offered by University of Oregon June 20-21

The University of Oregon has announced that it will offer an intensive, two-day postgraduate course in athletic injuries on its campus in Eugene June 20-21. During the course, which is sponsored jointly by the University of Oregon, University of Oregon Medical School and Lane County Medical Society, recent developments and practices in treatment of athletic injuries will be discussed and demonstrated.

Faculty for the sessions includes the following men prominent in this field: Charles Bechtol, professor of orthopaedic surgery at the University of California School of Medicine and orthopaedic consultant for the U.C.L.A. football team; Daniel H. Levinthal, orthopaedic consultant for the Los Angeles Rams; Edmund J. McDonnell, orthopaedic consultant for the Baltimore Orioles and Baltimore Colts; Harold P. Miller, head physician for the United States Olympic team and team physician for the University of California; and Donald Starr, clinical instructor in orthopaedic surgery at the University of British Columbia Medical School and orthopaedic consultant for the Vancouver (B.C.) Lions professional football team.

Donald B. Slocum of Eugene, clinical instructor in orthopaedic surgery at the University of Oregon Medical School and orthopaedic consultant for the University of Oregon Athletic Department, is general chairman of the two-day school. Vice chairman is Howard A. Molter of Eugene, orthopaedic consultant for the University of Oregon Athletic Department.

Cost of the course, which has been approved for 15 hours of Category II credit by the American Academy of General Practice, has been set at $25. This figure includes both the registration and tuition fees.

The course has been scheduled for the week prior to the AMA convention in San Francisco to enable members to attend the Eugene session on their way to the California meeting.

Application forms may be obtained by writing to: Athletic Injuries, Room 102 Education Building, University of Oregon, Eugene, Oregon.

Program of the postgraduate course on athletic injuries follows:

PROGRAM

Friday, June 20

MORNING SESSION:

Moderator: William Snell, M.D., professor of orthopaedic surgery, University of Oregon Medical School, Portland

7:45 to 8:30 Registration

8:30 to 8:45 Welcome: Purpose and Scope

8:45 to 10:30 Injuries to the Head, Spine, and Pelvis
William D. Swancutt, M.D., Eugene
Donald Stainsby, M.D., chief of neurosurgery, Sacred Heart Hospital, Eugene
Edmund J. McDonnell, M.D., Baltimore, Md.
Connie Jarvis, athletic trainer, Stanford University

10:30 to 10:45 Intermission

10:45 to 11:30 Athletic Dermatology
L. W. Stauffer, M.D., team physician, North Eugene High School

11:30 to 12:00 Legal Aspects of Sports Injuries
Ronald W. Husk, attorney at law, Eugene

12:00 Luncheon

AFTERNOON SESSION:

Moderator: Howard Molter, M.D., Eugene

1:20 to 2:15 Athletic Protective Equipment
Willard M. Hammer, line coach, University of Oregon, Eugene
Don Kirsch, baseball coach, University of Oregon, Eugene

2:15 to 3:00 Mechanics of Football Injuries
Donald B. Slocum, M.D., Eugene

3:00 to 3:15 Intermission

3:15 to 5:15 Injuries to the Knee and Thigh
Harold Muller, M.D., Berkeley, Cal.
Donald Starr, M.D., Vancouver, B.C.
Charles Bechtol, M.D., Los Angeles, Cal.
Robert Peterson, athletic trainer, University of California, Berkeley, Cal.

6:30 to 7:15 Hospitality Hour

7:15 Lane County Medical Society No-Host Dinner Meeting, Eugene Hotel
Guest Speaker: Harold P. Muller, M.D., Medical Experiences as Olympic Team Physician (All attending the postgraduate session and wives invited.)

Saturday, June 21

MORNING SESSION:

Moderator: Donald B. Slocum, M.D., Eugene

8:00 to 9:00 Physical Basis for Restriction from Athletics
Ray Hendrickson, principal, North Eugene High School; former president, Oregon High School Coaches Association
John Bonzer, M.D., Eugene
Howard A. Molter, M.D., Eugene

9:00 to 9:40 Principles of Field Examination and Treatment
George Guldager, M.D., team physician, University of Oregon, Eugene
Bob Officer, athletic trainer, University of Oregon; regional chairman, National Athletic Trainer's Association

9:40 to 10:00 Intermission

10:00 to 12:00 Injuries to the Shoulder and Upper Extremity
Charles Bechtol, M.D., Los Angeles, Cal.
Daniel H. Levinthal, M.D., Beverly Hills, Cal.
Donald Starr, M.D., Vancouver, B.C.
Connie Jarvis, Stanford, Cal.

12:00 to 1:15 Luncheon

AFTERNOON SESSION:

Moderator: Harold Muller, M.D., Berkeley, Cal.

1:15 to 3:15 Injuries to the Leg and Ankle
Edmund J. McDonnell, M.D., Baltimore, Md.
William Snell, M.D., professor of orthopaedic surgery, University of Oregon Medical School, Portland
Daniel H. Levinthal, M.D., Beverly Hills, Cal.
Edwin Lane, athletic trainer, Washington State College, Pullman, Wash.

3:15 to 3:30 Intermission

3:30 to 5:30 Principles of Athletic Taping
Howard A. Molter, M.D., Eugene
Donald B. Slocum, M.D., Eugene
Connie Jarvis, Stanford, Cal.
Bob Officer, Eugene
Edwin Lane, Pullman, Wash.
Robert Peterson, Berkeley, Cal.

DIAMOX*

nonmercurial diuretic ACETAZOLAMIDE LEDERLE

IN PREMENSTRUAL TENSION

AN EVER-WIDENING CIRCLE OF THERAPEUTIC INFLUENCE

Welcome relief can be the rule rather than the exception in the treatment of premenstrual tension so often associated with fluid retention.

Patients report marked improvement of physical and emotional well-being on a simple regimen of DIAMOX—½ - 1½ tablets daily, depending on weight. Treatment begins 6-10 days prior to onset of menstruation, or at the onset of symptoms.

Well-tolerated, a single oral dose of DIAMOX offers convenient daytime diuresis and nighttime rest.

Supplied: Scored tablets of 250 mg.; Syrup containing 250 mg. per 5 cc. teaspoonful and vials of 500 mg. for parenteral use.

helps anemic knights to more vigorous days

Glytinic®

the new amino acid-iron hematinic!

Dragon-slaying in the days of King Arthur was a rugged task for even Sir Lancelot! • Yet blood-building with iron, and iron alone, is often just as difficult...because a protein deficiency frequently accompanies iron deficiency anemia. Without glycine, formation of the blood molecule cannot take place* and iron is unsatisfactorily or incompletely assimilated.• That's why Glytinic, Boyle's new Amino Acid-Iron Hematinic, contains both glycine and ferrous gluconate...and that's why Glytinic often succeeds in building blood where other hematinics fail. Next time you're faced with an iron-deficiency anemia, help him enjoy more vigorous days by prescribing Glytinic...available in 100 tablet or 1 pint bottles.

Daily Dose (2 tablespoonfuls or 4 tablets) of Glytinic contains: Ferrous Gluconate-13.5 gr.; Glycine-1.3 Gm.; Vitamin B-12-10.0 mcg.; Thiamine HCl-7.5 mg.; Riboflavin-7.5 mg.; Pyridoxine HCl-2.25 mg.; Niacinamide-45.0 mg.; Panthenol-6.5 mg.; Liver Fraction 1, NF-5.0 gr.; Cobalt-0.05 mg.; Manganese-5.0 mg.

Oregon Trudeau Society To Be Chartered May 13 in Portland

After a period of preliminary organizational work, the Oregon Trudeau Society will become a reality with the formal chartering of the Society during its first scientific meeting at the Imperial Hotel in Portland, May 13. The meeting will coincide with the annual meeting of the Oregon Tuberculosis and Health Association.

Col. James H. Weir, M.C., Chief of the Pulmonary Disease Section, Fitzsimons Army Hospital, Denver, an authority on pulmonary diseases, will be featured speaker on an outstanding agenda that will include: an x-ray conference with panel discussion on interesting cases; short papers on timely subjects pertaining to chest diseases, including heart; and formal charter organization of the new society.

Lawrence M. Lowell, chairman of the Committee on Oregon Trudeau Society, with other members of the committee—William Cloyd and James T. Speros—point out that all Oregon physicians and surgeons interested in tuberculosis and other pulmonary diseases are urged to attend the session and join the Society. Reservations may be made by contacting Mr. Don Harman, case-finding director of Oregon Tuberculosis and Health Association, 605 Woodlark Building, Portland 5, CA. 7-5414.

For many years, the Oregon Tuberculosis and Health Association has had a medical advisory committee, composed of some 25 physicians and surgeons interested in tuberculosis and other chest diseases. Function of the committee has been to study and make recommendations regarding opportunities for local medical research, expansion of medical education programs, and procedures relating to case-finding. The group has enjoyed a professional association which has been mutually stimulating and which has tended to raise the standards of practice in the field of pulmonary diseases.

Members of the committee have long felt that there are other physicians and surgeons who would enjoy the association of this group. As members of a Trudeau Society, they would give strong leadership to an organization which has as its chief goal the eradication of tuberculosis and the maintenance of high standards of public health in the community, with particular emphasis on chest diseases.

The proposed Oregon Trudeau Society has approval of Oregon State Medical Society and the American Trudeau Society, medical section of the National Tuberculosis Association.

Southern Oregon Medical Society To Meet May 24 in Grants Pass

D. G. Mackie, Grants Pass, president of Southern Oregon Medical Society, has announced that two members of the faculty of the Stanford University School of Medicine will be guest lecturers at the Society's 67th Annual Meeting to be held at the Zottola's Country Club in Grants Pass on Saturday, May 24, 1958.

The guest speakers are Milton L. Rosenberg, San Francisco, assistant clinical professor of surgery (urology) and John V. Young, clinical instructor in medicine. Each guest speaker will present two lectures and participate in two round-table discussions in which they will be joined by members of the Society.

Dr. Mackie states that the entire program will be devoted to medical and surgical aspects of kidney diseases. It is being billed as a "Postgraduate Symposium on Renal Diseases" and has been approved by the American Academy of General Practice for six Category I credit hours for members of the Academy.

Registration is at 8:30 A.M. with the morning scientific session beginning at 9:00 A.M. The Society's annual business session will be conducted during lunch at 12:30 P.M., followed by the afternoon session at 2:00. The meeting is scheduled to close at 5:00 P.M.

Southern Oregon Medical Society was founded in 1892 as the component society for the physicians of Douglas, Josephine, Jackson, Klamath and Curry Counties. During subsequent years the physicians of each county but Curry have established their own local component societies. Physicians in Curry County are now members of the Southwestern Oregon Medical Society which also includes Coos County and physicians practicing in the coastal cities of Douglas and Lane Counties.

Even after establishing separate component societies, physicians of this area have continued to maintain the Southern Oregon Medical Society for the professional advancement of its members. The annual meetings, which are well attended, offer outstanding scientific programs and are rotated among the principal cities.

Thomas H. Emmens of Medford is vice-president and Edward C. Wall of Grants Pass is secretary-treasurer. The Board of Censors is composed of John P. Russell, Grants Pass, Chairman; Calvin L. Hunt, Klamath Falls; and Jack S. Ingram, Medford.

The program:

Morning Session

8:30 A.M. Registration (Fee—$10.00)

Symposium on

Acute and Chronic Renal Insufficiency

9:00 A.M. Medical Aspects ..... John V. Young

10:00 A.M. Surgical Aspects ... Milton L. Rosenberg

11:00 A.M. Round-Table Discussion

D. G. Mackie, Chairman

Panel Members

Milton L. Rosenberg — John V. Young

John R. Boe, Grants Pass — John T. Weisel, Medford

Oscar T. Heyerman, Medford

Afternoon Session

2:00 P.M. Urolithiasis ..... Milton L. Rosenberg

3:00 P.M. Renal Transplantation ..... John V. Young

4:00 P.M. Round-Table Discussion

D. G. Mackie, Chairman

Panel Members

Milton L. Rosenberg — John V. Young

R. R. Johnson, Grants Pass — F. J. Shaskey, Medford

W. S. Judy, Jr., Grants Pass — E. F. Tonn, Murphy

W. C. Foster Named to Medical Board

Wilmot C. Foster of Portland has been appointed by Gov. Robert D. Holmes to a third term on the State Board of Medical Examiners. His new term runs until Feb. 28, 1963. Dr. Foster is a member of the executive committee of the Federation of State Medical Boards of the United States.

Obituaries

Dr. Paul R. Schiewe, 37, of Astoria died February 27. At the time of his death, he held the office of president of Clatsop County Medical Society. Dr. Schiewe was born and reared in Portland and entered practice in Astoria four years ago. He was graduated from Jefferson High School in Portland, and Linfield College before entering the University of Oregon Medical School from which he was graduated in 1945. In addition to his interest in Society affairs, Dr. Schiewe was active in a number of community enterprises. For several years he was a participating member in the Astoria Junior Chamber of Commerce.

Dr. Delbert C. Stanard, 67, long-time Eugene physician, died March 27 in a local hospital. Dr. Stanard obtained his medical degree from the University of Oregon Medical School in 1921 and took postgraduate work in Philadelphia, Pa., and at Tulane University in New Orleans, La., specializing in EENT. Included among his varied community activities was work with the Boy Scouts for which he was honored with the Order of the Silver Beaver, highest award a local Boy Scout council can give. Also, he headed Civil Defense for his local area in 1951. Dr. Stanard served during World War II as a lieutenant-colonel from 1942-1944 while he was division surgeon of the 41st Division, and as a colonel in 1945 as medical training inspector for the Ninth Service Command. He was a past-president of Lane County Medical Society and past-president of Central Willamette Medical Society.

Jackson County Medical Society

Byron Hall, associate clinical professor and director of cancer chemotherapy of the Stanford University Medical School, was guest speaker at the March 12 meeting of the Jackson County Medical Society. The session was held at the Rogue Valley Country Club in Medford. From 1:30 to 5:30 in the afternoon of the same day, medical films were shown at the Country Club to physicians and registered nurses during a clinical teaching conference on Cancer and Its Treatment.

Oregon Academy of Science Honors Physician

Samuel Diack of Portland, chairman of the board of directors of the Oregon Museum of Science and Industry, was honored by the Oregon Academy of Science at its 16th Annual Meeting February 22. Dr. Diack was recognized for his work in behalf of the new OMSI building now being completed in the West Hills.

Doctors, Lawyers Hold Joint Meeting

At a joint session April 1 in Eugene, more than 200 Lane County physicians and lawyers met to discuss mutual problems and relationships. Following dinner, Circuit Judge William Fort moderated a panel question and answer forum. Panel members were: George C. McCallum and Donald E. Moore, Eugene physicians, and Attorneys Hale Thompson and Windsor Calkins.

Doctors, too,  *like "Premarin"*

The reasons are fairly simple. Doctors like "Premarin," in the first place, because it really relieves the symptoms of the menopause. It doesn't just mask them – it replaces what the patient lacks – natural estrogen.

Furthermore, if the patient is suffering from headache, insomnia, and arthritic-like symptoms before the menopause and even after, "Premarin" takes care of that, too.

Women, of course, like "Premarin," too, because it quickly relieves their symptoms and gives them a "sense of well-being."

"PREMARIN"®
conjugated estrogens (equine)

ANNUAL MEETING
Spokane
September 14-17, 1958

President, Milo T. Harris, M.D., Spokane Secretary, F. A. Tucker, M.D., Seattle Executive Secretary, Mr. R. W. Neill, Seattle

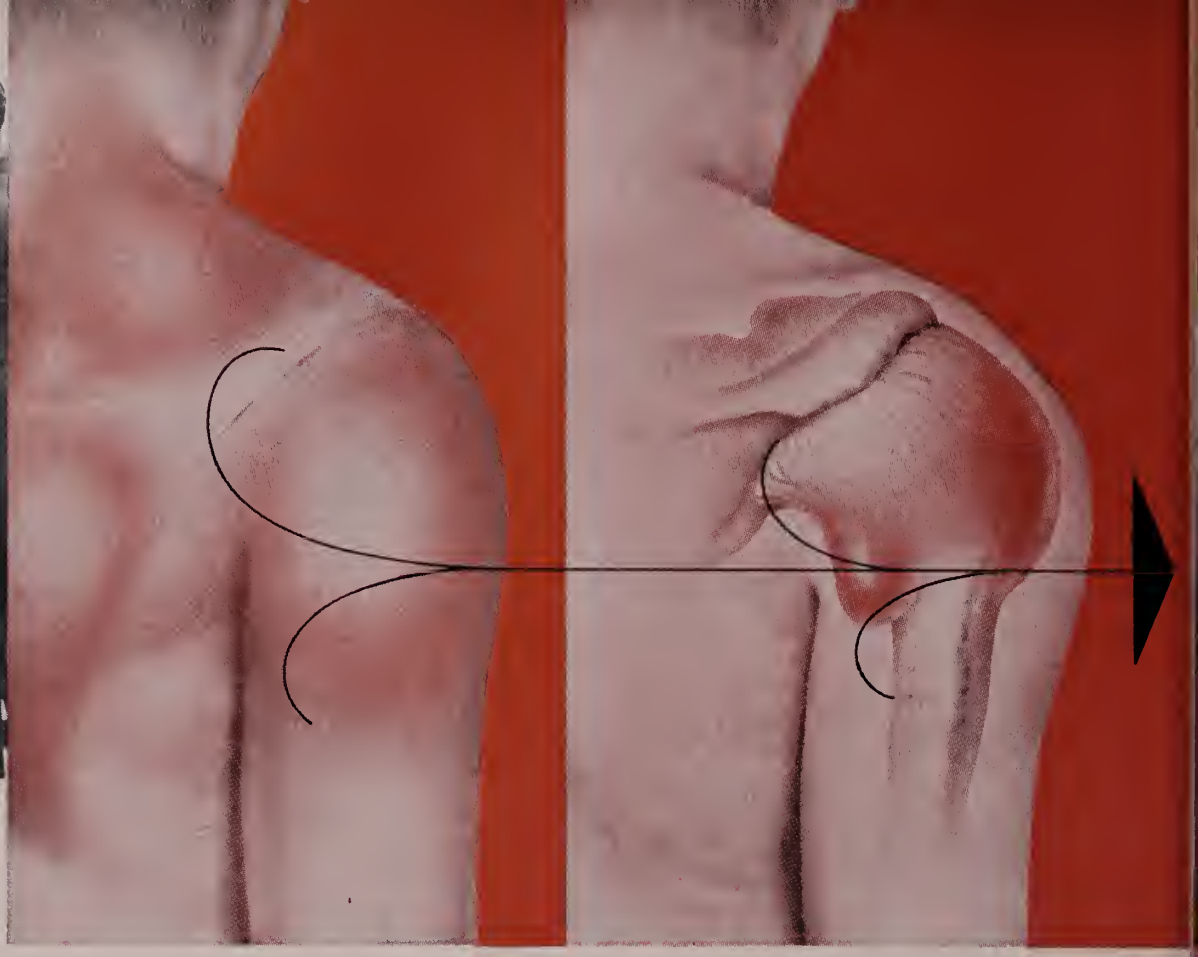
YAKIMA MEETING: Fig. 1. Milo T. Harris, Spokane, President, Washingtgon State Medical Association. Fig. 2. Fred M. Petrie, Toppenish, Honorary Member; Fred L. Burrows, Yakima, President, Yakima County Society; and Howard L. Hull, Yakima, Honorary Member. Fig. 3. G. P. Shepard, Yakima, Honorary Member; Albert J. Goss, Ellensburg, President of Kittitas County Medical Society. PASCO MEETING: Fig. 4. Charles G. Sutch, Richland, Secretary, Benton-Franklin County Society; Jack D. Freund, Kennewick, President, Benton-Franklin County Society; and Dr. Harris.

WSMA President Harris Urges Greater Participation in Civic Affairs

WSMA President, Milo T. Harris of Spokane, believes the oft-stated maxim, that "public relations for the medical profession starts and ends in the doctors' offices," is more important today than ever before.

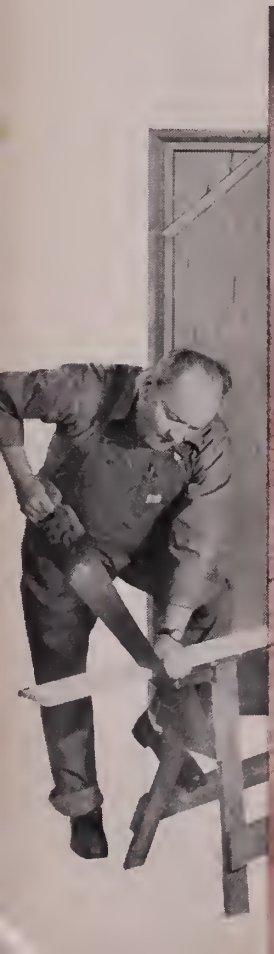
He drove this message home before Yakima, Kittitas and Benton-Franklin County Medical Society members as the honored guest speaker, in speeches at Yakima and Pasco.

The State Association President also urged the physicians to take more and more active interest in civic affairs, and to recognize their obligations to the press in providing scientific information that warrants public exposure.



He complimented the Yakima County Society for its early adoption of the "Guide for Cooperation" worked out between the various communication systems and the State Medical Association for a mutual understanding in the dissemination of medical news.

The 1958 Annual Convention of the Washington State Medical Association, he pointed out, is being held in Spokane on September 14-17, inclusive. Physicians of the East side were not only urged to attend the meeting, but to offer their services in the scientific program and exhibit phases of the Convention.



Dr. Harris said refresher courses would be offered for all medical practitioners. He also remarked that prominent guest speakers from all parts of the country would present scientific lectures of interest to specialty groups.

The Yakima Society paid homage to honorary members of the Society for their 30 years (or more) membership in the Society and for having served the public over such a long period of time.

"Rheumatoid arthritis is a constitutional disease with symptoms affecting chiefly joints and muscles."[1] "Pain in the affected joint is accompanied by splinting of the adjacent muscles, with resultant 'muscle spasm.' "[2]

rheumatoid arthritis involves both joints and muscles only

MEPROLONE®

THE FIRST MEPROBAMATE PREDNISOLONE THERAPY

meprobamate to relieve muscle spasm
prednisolone to suppress inflammation

relieves both muscle spasm and joint inflammation

MEPROLONE is the only anti-rheumatic-antiarthritic designed to relieve simultaneously (a) muscle spasm (b) joint-muscle inflammation (c) physical distress . . . and may thereby help prevent deformity and disability in more arthritic patients to a greater degree than ever before.

SUPPLIED: Multiple Compressed Tablets in bottles of 100, in three formulas:
MEPROLONE-5—5.0 mg. prednisolone, 400 mg. meprobamate and 200 mg. dried aluminum hydroxide gel.
MEPROLONE-2—2.0 mg. prednisolone, 200 mg. meprobamate and 200 mg. dried aluminum hydroxide gel.
MEPROLONE-1—supplies 1.0 mg. prednisolone in the same formula as MEPROLONE-2.

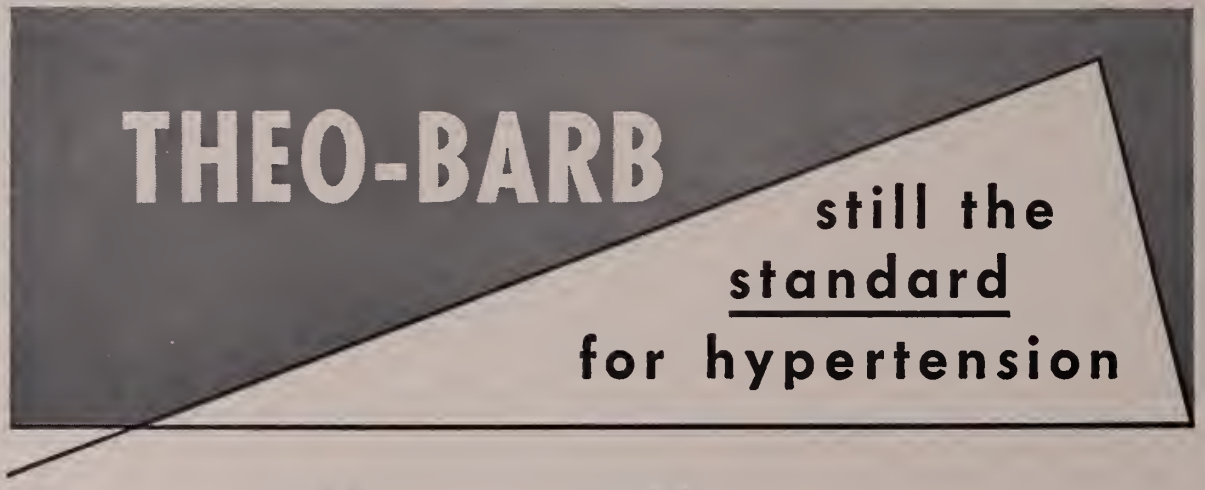
Dr. Luman S. Roach, 80, long-time Kalama physician, died December 14 of pneumonia, carcinoma of the prostate and arteriosclerotic heart disease. Following his graduation from the University of Oregon Medical School in 1912, Dr. Roach practiced in Seattle and then located in Kalama in 1919. He served for 12 years as a member of the Kalama School Board and also was Cowlitz County Health Officer for a number of years.

Dr. Francis J. Burns, 65, Spokane county coroner, died February 4 in a local hospital. Death was caused by generalized carcinomatosis due to adenocarcinoma of the left lung. Dr. Burns received his medical degree in 1921 from the Stritch School of Medicine of Loyola University in Chicago. During his 37-year medical career in Spokane, he served as director of the Medical Service Bureau of Spokane, medical examiner for the boy scouts and surgeon for the Spokane Fire Department. Dr. Burns had been county coroner since 1950. He was a veteran of both World Wars.

Dr. Wasily V. Muller, 61, died February 27 at his home in Seattle of a coronary thrombosis. Dr. Muller received his medical degree in 1930 from the University of Oregon Medical School. He was a physician for a mill in Skykomish and then practiced in North Bend before locating in Seattle in 1939.



Dr. LaZelle B. Sturdevant, 78, retired United States Public Health physician, died February 28 in a Seattle hospital of pulmonary edema due to confluent bronchopneumonia and terminal Parkinson's disease. Dr. Sturdevant was graduated in 1909 from the University of Nebraska College of Medicine. He practiced in Lincoln, Neb., for several years and then served in the Army Medical Corps during World War I. He moved to Seattle in 1929. Dr. Sturdevant had served with the U.S.P.H.S. for 25 years before his retirement in 1946.

Dr. Edwin L. Carlsen, 78, pioneer South Tacoma physician, died March 1 in a Tacoma hospital of hypernephrosis of the right kidney and arteriosclerosis. Dr. Carlsen was graduated from the University of Minnesota Medical School in 1906 and moved the same year to Tacoma where he interned in the Northern Pacific Beneficial Association Hospital.

Dr. Claud H. Weir, 80, of Seattle, retired EENT specialist, died March 8 of carcinoma of the prostate with multiple metastases. Dr. Weir received his medical training at Columbia University College of Physicians and Surgeons from which he was graduated in 1904. He served as a medical officer in the First World War.

Dr. Frank B. Wyman, 34, of Bellevue, died March 9 in a Seattle hospital three days after suffering a coronary artery occlusion. Dr. Wyman was graduated from Northwestern University Medical School in 1950. Before locating in Seattle, Dr. Wyman had practiced for a short time in Port Angeles.

Dr. Frank M. Carroll, 88, pioneer Seattle obstetrician

and gynecologist, died March 10 of chronic myocarditis due to chronic emphysema and chronic bronchiectasis. Dr. Carroll had practiced in Seattle since his graduation in 1896 from Cooper Medical College, San Francisco, until his retirement in 1951. Dr. Carroll was Seattle Health Officer between 1899 and 1901, King County Coroner from 1904 to 1908 and Seattle Health Commissioner from 1934 to 1943. During World War I, he served as a lieutenant colonel in the Army Medical Corps.

Dr. Francis H. Brown, 82, Seattle physician and surgeon for 47 years, died March 23 of a cerebral thrombosis due to cerebral arteriosclerosis. Dr. Brown received his medical education at the University of Southern California School of Medicine at Berkeley from which he received his degree in 1904. He located in Seattle in 1908, retiring from active practice three years ago. Dr. Brown was a past president of the Seattle Academy of Surgery.

Dr. Carl J. Johannesson, retired Walla Walla physician, surgeon and radiologist, died March 28 in Milwaukie, Oregon, where he had resided for the past two years. Dr. Johannesson, who came to the United States from Copenhagen, Denmark, in 1913, earned his medical degree at the Stritch School of Medicine of Loyola University, Chicago, in 1917. He had practiced in Walla Walla 35 years prior to moving to Oregon on January 1, 1956. He was past-president of Walla Walla County Medical Society and was a charter member of the Society of Nuclear Medicine.

Southwest Washington Academy of GP Holds Annual Meeting in Vancouver

John O. Milligan of Seattle, president of the Washington State Chapter of the American Academy of General Practice, was guest speaker at the Annual Meeting of the Southwest Washington Chapter of the Academy. The session was held at the Royal Oaks Country Club in Vancouver March 19.

Following dinner and social hour, members heard Dr. Milligan present a paper on Meckel's Diverticulum. Following his formal discussion, Dr. Milligan spoke on matters pertaining to the AAGP on a state and national level.

Election of officers was held during the business meeting that followed. New officers are: Donald Nelson, Vancouver, president; J. L. Axling, Longview, vice-president; G. W. Turley, Ridgefield, secretary-treasurer; W. S. Shepherd, Camas, director (two year term); H. L. Eldridge, Washougal, delegate; L. A. Hamilton, Longview, delegate; and James Park, Vancouver, and Donald Clark, Longview, alternate delegates. Robert B. Sullivan of Vancouver is completing his final year of a two year term as director.

The group also elected to extend an invitation to the Board of Directors of the Washington Chapter of AAGP to hold its 1959 Annual Meeting in Vancouver.

U.W. Surgeon Elected to Board

K. Alvin Merendino, professor of surgery at the University of Washington School of Medicine, has been elected to a six-year term as a member of the American Board of Surgery. Dr. Merendino represents the Pacific Coast Surgical Society on the 18-member board.

to achieve oral repository therapy

DURABOND® is a true repository technic for prolonging therapeutic effects from a single dose of oral medication. In Durabond a large molecular weight polyvalent base acts as a bonding agent and releases medication uniformly, gradually and over a prolonged period, independently of intestinal motility, specific pH or any other physiologic factor. Durabond employs no enteric coatings, waxes, resins or any other "drug traps." The amount of drug given is the amount released . . . all is available for absorption. All Synatan products incorporate the Durabond Principle.

Synatan

for control of appetite and mood

Each Synatan tabule contains:
Tanphetamin (*d*-amphetamine tannate) 17.5 mg.
in a protocolloid complex.

Indications: Whenever sustained, controlled tanphetamin therapy is desired for obesity; premenstrual, menopausal and postpartum depressions; neurasthenia; fatigue due to secondary anemia or other chronic illness; geriatric depression; alcoholism, and drug-induced drowsiness.

Dosage: 1 or 2 tabules at 10 a.m. for all-day control. For prescription economy, prescribe in bottles of 50.

Seco-Synatan

for control of appetite and mood in emotionally disturbed patients

Each Seco-Synatan tabule contains:
Tanphetamin (*d*-amphetamine tannate) 17.5 mg.
Secobarbital ..... 35.0 mg.
in a protocolloid complex.

Indications: In addition to controlling the patient's appetite, Seco-Synatan breaks the barrier of depression . . . creates a sense of well-being . . . buffers the patient against the ups and downs of his environment.

Dosage: 1 or 2 tabules at 10 a.m. for all-day control. For prescription economy, available in bottles of 50.

Synatan Forte

for greater anorexic action and control of mood

A higher potency form of Synatan.
Each tabule contains:
Tanphetamin (*d*-amphetamine tannate) 26.25 mg.
in a protocolloid complex.

Indications: Whenever higher potency tanphetamin therapy is desirable.

Dosage: 1 or 2 tabules at 10 a.m., or 1 tabule before breakfast and 1 before lunch, for all-day control.

Your pharmacist has been especially alerted to provide additional information regarding Neisler prescription specialties.

Past-President of State Association Wilmot D. Read of Tacoma Succumbs

Dr. Wilmot D. Read of Tacoma, whose distinguished medical career spanned more than a half-century, died in a Tacoma hospital April 3 at the age of 78. He had been in failing health for a number of months.

WILMOT D. READ, M.D.

Devoting himself unstintingly to the service of his profession and the public over the years, Dr. Read was a leader in the affairs of organized medicine for decades, and a pioneer in the field of prepaid medical care.

In 1949, he was chosen by the Washington State Medical Association as the outstanding general practitioner of the year in the state. He became an honorary (life) member of the Association the same year, and was initiated into the exculsive 50-Year Club in 1954.

Dr. Read was first a delegate to the State Medical Association in 1909, and was president of the Pierce County Medical Society in 1912. During the First World War, he served as a captain in the Medical Corps, and went overseas with Base Hospital No. 93.

When the State Medical Association created the office of president-elect in 1921, Dr. Read was first to fill that position. In 1922, during his presidency, he organized the Public Health League for dissemination of information to the public. He was elected first speaker of the State Medical Association's House of Delegates in 1939, and served in that capacity until 1947. He also served as a trustee for several years, and worked on many scientific committees.

Dr. Read was the first president of the Pierce County Medical Service Bureau, which was organized in 1917 as the earliest doctor-sponsored prepaid medical plan in the United States. He also helped to found the Washington State Medical Bureau, predecessor of Washington Physician's Service, and was president of this organization from 1939 to 1941.

Dr. Read was a member of many professional, fraternal and civic organizations, including the American College of Surgeons, Elks Lodge, the Shrine, American Legion, Tacoma Golf and Country Club and Seniors Northwest Golf Association.

Born in Iowa in 1879, Dr. Read moved to Tacoma with his parents in 1889. He attended grammar and high school there. His father, Abel Read, was a Tacoma police captain for many years.

After graduation from Cooper Medical College (Stanford University) in 1903, Dr. Read returned to Tacoma and entered private practice. He served as assistant superintendent of Western Washington State Hospital in 1904.

Dr. Read was married in 1904 to the former Kathryn Calhoun, who survives him. He also is survived by two sons and four grandchildren. One son, Jess, is a surgeon, and the other, Robert, is a dentist. Both practice in Tacoma. Dr. Jess Read, now a delegate to the American Medical Association, was Speaker of the State Medical Association's House of Delegates in 1954, and is the only physician yet to succeed his father in that position.

Private funeral services were held in Tacoma April 5. Instead of floral tributes, the family asked that remembrances be sent to the Dr. Wilmot D. Read Memorial Fund which has been established to develop a recovery department for postoperative patients at Tacoma General Hospital.

12 Scientific Exhibits Planned for WSMA Annual Meeting

Twelve high-quality scientific exhibits will be displayed at the 1958 convention of the Washington State Medical Association in Spokane September 14-17, according to an announcement by L. S. Highsmith, chairman of the Scientific Exhibits Committee.

The scientific exhibits will be part of a comprehensive postgraduate education meeting which will feature six top-flight guest speakers in a two-day scientific program and one day of medical films. Names of five of the guest speakers have previously been announced. The sixth to be selected is Eugene F. Poutasse of the Cleveland Clinic, whose main subject will be: Renal Artery Disease in Hypertension.

Titles and sponsors of the scientific exhibits announced to date are:

Advances in Vascular Surgery—R. N. Kleaveland, Spokane.

Extra Corporeal Circulation Techniques—Ralph Berg and Henry T. Lang, Spokane.

Virus Disease Research—Ernest Stone, D.V.M., Pullman, dean, School of Veterinary Medicine, Washington State College.

Pitfalls in Office Radiology—Patrick A. Lynch, John E. Downing and Edward J. James, Yakima.

Emergency Care of Eye Injuries—Robert J. Davis, Spokane.

Current Use of the Tuberculin Skin Test in Medical Practice—Cedric Northrop, Seattle.

Bleeding in the Third Trimester—Ralph T. Harsh and David Groenig, Spokane.

Final arrangements have not yet been completed on the other exhibits to be displayed. Further details will be announced soon.

1958 Fishing Derby To Be Held at Priest Lake in North Idaho

Scenic Priest Lake in Northern Idaho will be the site of the doctors' fishing derby to be held September 15 as an event of the 1958 convention of the Washington State Medical Association, according to O. Charles Olson of Spokane, fishing derby chairman.

The fishing derby will be headquartered at Linger Longer Lodge at Priest Lake. Round-trip bus transportation will be provided from the Davenport Hotel in Spokane, where the convention will be held September 14-17.

Boats and out-of-state licenses will be provided to participants in the derby, and breakfast, luncheon and an evening banquet will be served. All of this, as well as the cost of transportation, will be included in the price of the ticket, which will be announced in the near future when application blanks are sent out.

MEDICAL BUREAU INCORPORATORS—Shown above are four of the six physicians who acted as incorporators of the King County Medical Service Corporation and signed the original articles of incorporation on April 6, 1933. Looking over the original minute books are: standing, Albert J. Bowles, Vern Spickard and Thomas Morcom; seated, Raymond L. Zech. The other two incorporators are Arthur Crookall, now retired and living in California, and H. Garner Wright, who resigned from the Corporation. Dr. Bowles and Dr. Spickard still are practicing in Seattle and are active members of the Bureau.

King County Medical Service Corporation Observes 25th Anniversary in 1958

King County Medical Service Corporation of Seattle, recognized throughout the nation as one of the first and most successful service-type prepaid health care plans, this year is observing its 25th anniversary.

King County Medical was formed in 1933 by the membership of the King County Medical Society to accomplish two purposes: (1) make available medical, surgical and hospital care to thousands of persons in King County who could not afford it, and (2) make available to these people free choice of all doctors participating in the plan. It was incorporated as a non-profit organization by six physicians representing the Society (see photo above) and has been operated by a board of physicians since that time.

At the present time 225,000 persons are covered by King County Medical, better than one out of every four persons residing in the county. In the 25 years since it was organized, the Corporation has paid 74 million dollars to physicians and hospitals for services to subscribers and their families. Last year the 1,002 physicians participating in the plan received a total of $5,246,000 for services.

"The success that King County Medical has achieved in these 25 years is a tribute to all of the doctors of the county—both those who originally organized it and those who have supported it throughout the years," Roland D. Pinkham, president of the Corporation, said. "We think that it has been demonstrated in these 25 years that a doctor-operated prepaid health care plan can provide the best coverage for the subscriber and can best represent the interests of the doctors."

The board of trustees of the Corporation, in addition to Dr. Pinkham, is composed of the following Seattle physicians: Eugene F. McElmeel, vice-president; John R. Wilton, secretary, and Albert F. Lee, Robert C. Manchester, Gordon A. Dodds and Frank C. Henry, trustees.

metaphosphate produced markedly higher blood levels than capsules containing either the corresponding base or the hydrochloride alone. In addition, the average levels derived from the tetracycline base or the chlortetracycline base were higher than those produced by the corresponding hydrochloride though lower than those resulting from the mixture containing the base and sodium metaphosphate. In the study with chlortetracycline[6] capsules containing a mixture of the hydrochloride and sodium metaphosphate were also included in the crossover, and the average levels produced by these capsules were the same as with the mixture of chlortetracycline base with sodium metaphosphate.

Although the enhancement of blood levels of tetracycline by phosphate, either complexed to the tetracycline or mixed with the base or the hydrochloride, thus seemed fairly well established, some doubts still remained because certain reliable observers (including many whose results have not been published) failed to confirm the findings with the materials and methods they used. Further confusion seemed to be added by a subsequent report of Welch et al.,[7] who, in repeating a crossover study with capsules of tetracycline phosphate complex and tetracycline hydrochloride with and without sodium metaphosphate, found much higher

"...Tetracycline hydrochloride and citric acid, in an encapsulated mixture, produced higher serum concentrations and greater urinary excretions, and hence better absorption of tetracyclines, than any other preparation studied..."

last mentioned paper of t al.[7] indicates that in their study the capsules tetracycline hydrochloride, chlortetracycline hydrochloride and tetracycline phosphate complex all contained dicalcium phosphate as a filler, whereas the capsules containing citric acid and sodium hexametaphosphate did not contain any dicalcium phosphate. This could clearly explain the discrepancies noted in that study. Likewise, the inconsistencies in other studies may very well have been due to the presence of calcium as fillers in some of the capsules and not in others.

were published simultaneously with the last mentioned report of Welch et al.[7] These data were based on thoroughly controlled studies both in rats[8] and in man[9] and include additional findings that serve to explain, fairly conclusively, the various discrepancies that have been mentioned.

The experiments in rats[8] were carried out to study the effects of citric acid, dicalcium phosphate, sodium metaphosphate, food, oil and sorbitol on the serum antibacterial activity produced by the administration of tetracycline hydrochloride or tetracycline base. Citric acid administered in equal weight with tetracycline hydrochloride gave the highest concentrations of all the preparations studied. No enhancing effect was obtained from citric acid when given with tetracycline base. Dicalcium phosphate and food resulted in lower, and sodium metaphosphate in higher, serum antibacterial activity than was observed in their absence. Oil and sorbitol did not interfere with tetracycline absorption.

Dicalcium phosphate is widely used as a filler in various capsules, including those of the tetracyclines. The authors cite a large number of other studies that implicate the presence of calcium ions as the cause of the reduced absorption of tetracyclines and show that citric acid can partially neutralize this effect. The depressing effect of food on the serum levels of tetracycline is likewise explained by the goodly amount of minerals contained in commercial laboratory diets, and they postulate that the multivalent cations may be responsible for the poorer absorption of the drug. The authors could not explain the failure of citric acid to enhance serum concentrations when administered with tetracycline base in contrast to its marked effect when given as the hydrochloride. However, they hypothesized that the ability of citric acid to enhance serum levels of tetracycline is related to its ability to form complexes

This, however, fails to explain the most recent findings of Welch and Wright,[10] who compared the absorption of three capsules, each containing 250 mg. of oxytetracycline hydrochloride — one without any adjuvant, one with 250 mg. of citric acid and the third with 380 mg. of sodium hexametaphosphate; no other filler was contained in any of these capsules. In triple

James A. Thompson, specialist in internal medicine, has recently joined the staff of the Memorial Clinic in Olympia. Dr. Thompson received his medical degree in 1953 from Washington University School of Medicine, St. Louis, and served his internship at King County Hospital, Seattle. He also took postgraduate training at Georgetown University Hospital, Washington, D.C., and the Lahey Clinic, Boston, Mass.

Charles C. Martin has entered into association with Raymond A. Kardong and Donald W. McIlleece in Bellevue. Dr. Martin received his medical training at Northwestern University Medical School from which he was graduated in 1951. He interned in the University of Illinois Research and Educational Hospitals in Chicago and then took further training in the Veterans Administration Hospitals in Chicago and Seattle.

David G. Wallin has opened offices in Lynnwood for the practice of internal medicine. Dr. Wallin was graduated in 1953 from Boston University School of Medicine and served his internship in Mercy Hospital, Baltimore, Md. He took his specialty training at Massachusetts Memorial Hospital, Boston City Hospital and Veterans Administration Hospital in Seattle.

W. Scott Overturf has entered into association with Lewis D. Fink for the practice of medicine and surgery in Redmond. Dr. Overturf received his medical education at McGill University Faculty of Medicine, Montreal, Canada. Following his graduation from medical school in 1955, he interned at Swedish Hospital, Seattle, and then served a one-year residency in surgery at St. Luke's Hospital in Spokane.

Basil Gregores, pediatrician, has joined in asociation with Robert Evoy and Ed Galta in Renton. Dr. Gregores was graduated from the University of Washington School of Medicine in 1953 and took his internship in New York. He served a two-year residency at Children's Hospital in Detroit. Dr. Gregores had practiced in Burien during the past year.

Harold T. Pederson Named Director of Medical Service Bureau of Spokane

Harold T. Pederson, Spokane internist, assumed his new duties as medical director of the Medical Service Bureau of Spokane on May 1. He succeeds Francis J. Burns who died February 4.

Dr. Pederson had served as president of the Medical Service Corporation, controlling board of the bureau, for the last two years.

The bureau was organized in 1933, two years after Dr. Pederson opened his first offices in Spokane, and now has 132,426 subscribers, who received medical services from member physicians totaling $3,299,147 during 1957.

Essay Contest Winner Named

An Edmonds High School junior, James Hammer, 16, has won first place prize of $50 in the essay contest sponsored by the American Medical Association and Snohomish County Medical Society. The youth's essay on The Advantages of Private Medical Care has been entered in the national contest.

Northwest Internists Hear Karl Meyer at Annual Meeting of Tacoma Academy

About 350 physicians from the Northwest and British Columbia gathered in Tacoma March 7 for the eighth annual meeting of the Tacoma Academy of Internal Medicine. Banquet speaker was Karl F. Meyer, director of the George William Hooper Foundation in the University of California Medical Center. Dr. Meyer spoke on medical research in the Soviet Union where he spent 32 days in 1956.

The subject of virus diseases was chosen by the Academy to be discussed at the meeting because of the tremendous increase in knowledge about them and a perfecting of methods of isolating and developing immunization against viruses.

In addition to Dr. Meyer, two other authorities in the field of viral diseases presented papers during the one-day session. They were Gordon Meiklejohn, head of the department of medicine at the University of Colorado School of Medicine, and William Kirby, professor of medicine at the University of Washington School of Medicine. Dr. Meiklejohn discussed recent advances in the diagnosis and management of infectious diseases, and Dr. Kirby spoke on problems in the use of antibiotics.

During the morning session, the following members of the Tacoma Academy presented case histories for the discussion program: Robert E. Lane, Charles Arnold, Bernard Rowen, Rodger Dille, Calvin R. Lantz, John L. Whitaker, Theodore J. H. Smith and H. A. Anderson.

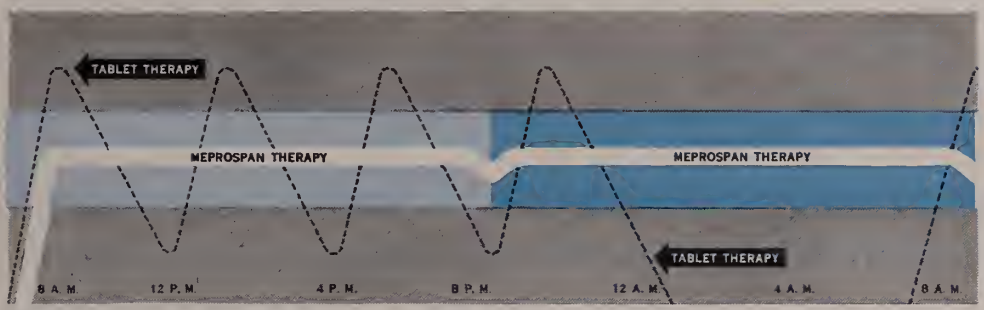
Physician-Artists Invited To Exhibit at AMA Convention in San Francisco

All physicians interested in art are invited to become members of the American Physicians' Art Association and to exhibit their work at the AMA meeting in San Francisco June 23-27. Exhibit classifications will include traditional and modern art, sculpture, crafts, and photography (salon or color slides).

Only requirement of membership in the Art Association is that a physician be a member in good standing of his local medical society.

Those interested in joining the Association and exhibiting at the AMA convention are asked to contact: Edmund H. Smith, M.D., 3434 Cascadia Ave., Seattle, Wash.

Clark County Has Mass Anti-TB Survey



For the first time in three years, a mass anti-tuberculosis survey has been conducted in Clark County. The two-month chest x-ray campaign was begun March 3 and runs through May 3. Goal of the survey has been to obtain an x-ray of every Clark County resident who is 15 years or older.

Sponsored jointly by Clark County Health Department, Clark County Tuberculosis Association, Washington State Health Department and the Washington Tuberculosis Association with the cooperation of Clark County Medical Society, the survey is expected to cost $17,040.

During the 1955 campaign, 25 persons identified through the free chest x-rays were hospitalized with active tuberculosis. A total of 24 new active cases were reported from Clark County during the past year.

New... meprobamate prolonged release capsules

Evenly sustain relaxation of mind and muscle 'round the clock

TWO MEPROSPAN CAPSULES IN THE MORNING RELIEVE ANXIETY, TENSION AND SKELETAL MUSCLE SPASM THROUGHOUT THE DAY.

Economical treatment of the many conditions amenable to ACTH therapy

CORTROPHIN*-ZINC†

Use Cortrophin-Zinc to provide relief in the 100 or more conditions amenable to ACTH therapy. It's economical because each injection lasts at least 24 hours in the most acute cases, to 48 or even 72 hours in milder cases. It's easy to handle, too, because it is an aqueous suspension which flows freely through a 26-gauge needle with no preheating. Clinically proven in thousands of patients, an advance in ACTH therapy.

Available in 5-cc vials, each cc providing 40 U.S.P. units of corticotropin with 2.0 mg zinc.

*T.M.—Cortrophin

†Potent Pending. Available in other countries as Cortrophine-Z.

Idaho State Medical Association

July 6-9 1958
at Sun Valley

President Hoyt B.

to the 66th of the Idaho

HOYT B. WOOLLEY, M.D., Idaho Falls

Hoyt B. Woolley, Idaho Falls, President of the Idaho State Medical Association, cordially invites the physicians in the Northwest and their wives to attend and to participate in the most outstanding meeting in the West—the 66th Annual Meeting of the Idaho State Medical Association at beautiful Sun Valley, July 6, 7, 8, 9, 1958.

The Program Committee for the meeting, under the capable leadership of Fred E. Wallber of Idaho Falls, has arranged another excellent scientific program for you. Five nationally-prominent physician-surgeon instructors have accepted invitations to present the lectures for this year's meeting. Topics have been selected with care to provide you the very latest information in the fields of orthopedic surgery, internal medicine, obstetrics and gynecology, surgery and urology.

The famous "Idaho Formula"—part scientific, part pleasure—will prevail again for the 66th Annual Session. Scientific sessions will begin on the dot of 9 a.m. each day, Monday through Wednesday, and will conclude by 1 p.m. The afternoons are deliberately left free of meetings and conferences so that each person attending can relax and enjoy recreational facilities that are so abundant at Sun Valley!

Sun Valley is extremely pleasant in July. The days are warm and lazy—the evenings cool and clear. Entertainment will be furnished in large quantities by Hap Miller and his orchestra in the famous Duchin Room of the Lodge. Larry LaPrise and the versatile Sun Valley Trio will play for your dancing and amusement in the Ram Room.

Woolley invites you

Annual Session
State Medical Association

..... July 6-9, 1958 at *SUN VALLEY*

The annual Golf Tournament will be played on the Sun Valley Course—one of the sportiest, most challenging courses in the West. This event should provide you considerable pleasure—even if you tend to take your golf seriously. Duffers and low-handicap players are especially invited to participate in this event. If serious competition is to your liking, you must enter the Association's Annual Trap Shoot. Rudy Eitchen looks forward to setting up the event. This is the one affair that attracts more physicians each year. Better bring along your shotgun.

For the young-at-heart who still play tennis, faur courts will be ready for you. In event you feel the desire to do some stream fishing, we suggest you bring alang your tackle. If you forget this item in packing, you can rent anything yau need. Potential cowboys or cowgirls can all be like the Western TV shows and gallop aver hill and dale on horses from the Sun Valley Stables. Guides are available so that you will not get lost. (No six-guns allowed!) If you want to just sit in the sun and look around, you'll find plenty of comfortable lounges and chairs.

A highly enjoyable social event has been planned each evening for your amusement. Something new has been added this year—A Welcome to the ISMA Annual Meeting get-acquainted-open house will be held at the Harriman Cottage on Sunday evening. On Monday evening the famous Barbecue will be held at Trail Creek. Buses will be provided to get you there. Bring along a warm jacket for this outstanding party. Other events have been planned with but one thought in mind—to provide good food, good entertainment, and a good time for all.

Naturally, it's sport clothes for nearly every function. Bermuda shorts, gay sport shirts and slacks are a must. The exception to this, of course, is the annual President's Banquet which will be held on Wednesday evening in the Lodge. Summer formals for the ladies, dinner jackets or dark suits for the doctors.

For sparkling scientific sessions, outstanding recreation, good fellowship, entertainment and relaxation in beautiful surroundings, we extend to each Northwest physician and his wife a most cordial and warm invitation to attend the 66th Annual Meeting of the Idaho State Medical Association at Sun Valley, July 6, 7, 8, 9, 1958.

Idaho Chapter of AAGP To Meet May 10

L. F. Lesser of Boise, president of the Idaho Chapter, American Academy of General Practice, has announced that the organization, in cooperation with Lederle Laboratories, Inc., will sponsor a one-day clinical session in Boise on Saturday, May 10.

Speakers for the meeting, which will be held at the Hotel Boise, include James B. Donaldson, associate professor of medicine, Hahnemann Medical College, Philadelphia; Arthur D. Hengerer, associate professor of obstetrics and gynecology, Albany Medical College, Albany, New York; William H. Requarth, associate professor of surgery, University of Illinois School of Medicine, Chicago.

State Board of Medicine

Three Temporary Licenses were granted in March. Receiving such licenses were:

Richard N. Smith, Twin Falls. Graduate of Ohio State University of Medicine, Columbus. M.D. Degree 1943. Internship Starling-Loving University Hospital, Columbus, 1944. Granted T-201 March 4, 1958. General.

Dale D. J. Chodos, Idaho Falls. Graduate St. Louis University School of Medicine, St. Louis, Missouri. M.D. Degree 1954. Internship, Salt Lake General Hospital, Salt Lake City, 1955. Pediatric residency, Salt Lake General Hospital, 1957. Granted T-202 March 7, 1958. Pediatrics.

David Clarence Valder, Moscow. Graduate University of Oklahoma School of Medicine, Oklahoma City. M.D. Degree 1951. Internship University Hospitals, Ann Arbor, Michigan. Surgical residency, University Hospitals, 1952-56. Granted T-203 March 7, 1958. General Surgery.

Nampa Physicians Club Formed

R. L. Rodwell of Nampa has been named president of the newly formed Nampa Physicians Club. E. R. Carlsson, Nampa, was named secretary.

Purpose of the club, according to Dr. Rodwell, is to allow physicians to meet and exchange ideas on medical care, new advances in medicine and problems of community welfare in general.

Idaho Society of Internal Medicine

William D. Forney of Boise, president for the Idaho Society of Internal Medicine, has announced that a dinner meeting of members of this society will be held at Sun Valley on Friday, September 26.

Bonner-Boundary Society Elects Officers

New officers of the Bonner-Boundary Medical Society elected at a recent meeting are:

PRESIDENT—Helen E. Peterson, Sandpoint.

SECRETARY-TREASURER—Fred E. Marineau, Sandpoint.

Eastern Idaho Tumor Board Elects Officers for 1958

Officers of the Eastern Idaho Tumor Board for 1958 are Robert Butz of Idaho Falls, president, and P. Blair Ellsworth also of Idaho Falls, reelected secretary-treasurer.

The committee of the Tumor Board, which is sponsored by the Idaho Chapter of the American Cancer Society, is comprised of staff physicians from Sacred Heart and Idaho Falls LDS Hospitals. Members from Sacred Heart Hospital are: Dr. Butz, Philip Leavitt, J. A. Williams, and Dauchy Migel. From Idaho Falls LDS Hospital are: Morris Henninger, Bland Geddings, Newell Battles, and Dr. Ellsworth.

During 1957, the Tumor Board saw 89 patients. Of these patients, 48 were presented in person by their family physician. Patients came from eight counties in Southeastern Idaho, three patients from Montana, and one from Utah.

The Board, which meets at 8 A.M. each first and third Friday of the month at Idaho Falls LDS Hospital, sees cancer cases or suspected cases without charge to the patient.

Utah and Idaho Internists To Present Papers

The American College of Physicians combined regional meeting of Utah and Idaho members will be held at Sun Valley, September 27. A number of papers will be presented by Utah and Idaho internists. Chester Keefer, Director and Wade Professor of Medicine, Boston University School of Medicine, has been invited to address the two-state session, R. P. Howard of Pocatello, Idaho Governor for the College, announces.

Maurice M. Burkholder, Boise, is program chairman for the session.

Boise Valley Chapter of ACS To Meet June 14

Spring session of the Boise Valley Chapter of the American College of Surgeons will be held in Boise on Saturday, June 14, A. Curtis Jones of Boise, president, reports. Guest speaker will be Clarence J. Berne, Los Angeles, professor of surgery, University of Southern California School of Medicine

Diabetes Association Honors Glenn Voyles

Glenn Q. Voyles, Twin Falls, has been appointed Idaho Governor for the American Diabetes Association for a three-year term. Dr. Voyles was notified of his appointment by John A. Reed of Washington, D.C., president of the American Diabetes Association.

County Health Officer Appointed

Latah county commissioners have appointed Charles E. Marsh to succeed John M. Ayers of Moscow as county health officer.

Pacific Northwest Pathologists Hold Semi-Annual Meeting in Portland

Spring Session of Pacific Northwest Society of Pathologists was held at the University of Oregon Medical School, Portland, May 2 and 3. President Harold E. Taylor of Vancouver, B. C., presided.

Immediately preceding the meeting, April 29 to May 1, a radioisotope technique workshop, first of its kind, was conducted by the department of clinical pathology at the Medical School. It was sponsored by Pacific Northwest Society of Pathologists, College of American Pathologists, and American Society of Clinical Pathologists. Raymond D. Grandahl and Tyra T. Hutchens directed the workshop, which included demonstration of the latest uses of radioisotopes in diagnosis and treatment of disease.

Following is the list of guest speakers and their subjects: John B. Hazard, pathologist of the Cleveland Clinic, Cleveland, Ohio, Pathologic Anatomy of Thyroid Disease; Frank B. Johnson, Armed Forces Institute of Pathology, Washington, D.C., Special Stains in Pathologic Anatomy Diagnosis; Mr. Harry C. Ehrmantraut, Director of Applications Research Department, Spinco Division, Beckman Instruments, Inc., Palo Alto, Cal., Clinical Significance of Paper Electrophoresis; J. B. Thiersch, Seattle, Cytosurgical Diagnosis of Breast Lesions; Warren C. Hunter, professor of pathology at University of Oregon Medical School, Portland, Concomitant Stromal Endometriosis and Adenomyosis of Uterus; Nelson R. Niles, department of pathology, UOMS, Portland, Myeloproliferative Disease; and Mr. Gatlin Brandon, Director of Hygienic Laboratory, Oregon State Board of Health, Portland, Virus Problems of Importance in the Clinical Laboratory. Asia-Pacific Academy of Ophthalmology Sponsoring Good Will Tour to Orient

Following the International Congress of Ophthalmology in Brussels in September 1958, the Asia-Pacific Academy of Ophthalmology is sponsoring a good will tour of the Orient. During the one-month tour, joint meetings will be held with ophthalmologists in Pakistan, India, Thailand, the Philippines, and Hong Kong.

Principle aims of the Academy, which was organized in 1957, are to extend ophthalmologic knowledge and to advance the arts and sciences of ophthalmology and related sciences in Asia and in countries bordering the Pacific Ocean; to stimulate research in tropical and systemic eye diseases that are particularly prevalent in Asia and in countries bordering the Pacific Ocean; to cultivate social and fraternal relationship of physicians residing in Asia; and to offer postgraduate instruction in ophthalmology through lectures, round-table discussions, seminars, clinics and films.

Physicians wishing to participate in the postgraduate lectures and seminars on ophthalmology should contact: William J. Holmes, M.D., Liaison Secretary, Suite 280, Alexander Young Building, Honolulu 13, Hawaii.

For information regarding travel arrangements write to: Compass Travel Bureau, 55 W. 42nd Street, New York 26, N.Y.

American Medical Golfing Association Annual Tournament June 23 at San Francisco

Forty-Third Annual Tournament of the American Medical Golfing Association will be held in conjunction with the AMA Convention June 23 in San Francisco. Tee off time is scheduled from 8 A.M. to 2 P.M. at the beautiful Olympic Lakeside Golf and Country Club. The entire day will be devoted to rest and relaxation with golf, luncheon, banquet, and a prize for everyone. The committee invites all golfing physicians to attend. Handicaps scratch to 30 in flights.

For further information you are asked to contact James J. Leary, M.D., Secretary, 450 Sutter Street, San Francisco, Cal.

PEARL RIVER, N. Y.

Report from the Washington Office of AMA

Thomas H. Alphin, M.D.

Washington, D.C.—The recession continues to influence the course of much legislation, as Congress points toward the windup of its session. Even in the health fields, bills that promise in one way or another to alleviate unemployment appear to have priority. At the same time, federal departments are favoring construction grants to projects that can be started without much delay.

In legislation, here are some of the developments:

1. Liberalizations in unemployment compensation and in social security are receiving constant attention on Capitol Hill. At this writing, the bill to extend the period for unemployment compensation payments is making progress. There is the possibility also that it will make participation mandatory for all employers.

Prominent among proposed changes in the social security program itself is the Forand bill for free hospitalization and in-hospital medical care and surgery for persons entitled to social security benefits. It is being pushed by the AFL-CIO and by some liberal Democrats, and opposed by the American Medical Association and a growing group of other organizations. The opposition is convinced that the Forand bill is unnecessary, that it would be far more costly than anticipated, and that it would point the way to a broad national medical care plan for all persons covered by social security.

2. A controversial bill to vastly increase money available for grants for community facilities—waste plants, hospitals, state medical schools included—is active in Congress. One proposal is to vote a billion dollars, to be lent out (at about 3½ per cent interest for 50 years) to communities. The objective here, as in many other measures, is to put people to work on construction projects.

Federal agencies have evolved a number of schemes to get U.S. dollars into circulation faster, and are attempting to work out others. In each case described below, no additional appropriation is involved; money is shifted from a project that is getting a slow start to one that is about ready to begin construction. Also, all totals given represent amounts to be spent by the sponsors as well as the federal government. Here are arrangements already made:

1. In January, the Hill-Burton hospital construction program called for U.S. grants to start buildings valued at $381 million; this figure has been stepped up to $405 million by July 1.

2. Between January and July 1, the original plan was to allocate enough money to start $120 million in construction for health research plants. This has been increased to $182 million.

3. Before the recession became so prominent an issue, the plan was to grant enough U.S. money to start construction of $170 million in sewage plants. Under pressure, the total has been increased to $215 million.

In most cases, when a project is delayed and thus loses its allocation, the grant is re-scheduled for next fiscal year.

° ° ° ° ° °

American Medical Association is one of the four sponsors of a new Joint Council to Improve the Health Care of the Aged. The others are American Dental Association, American Hospital Association and American Nursing Homes Association.

The council already has authorized research in a number of directions to (a) analyze the health needs of the aged, (b) appraise available health resources for them, and (c) develop the best possible health care for them, regardless of their economic status.

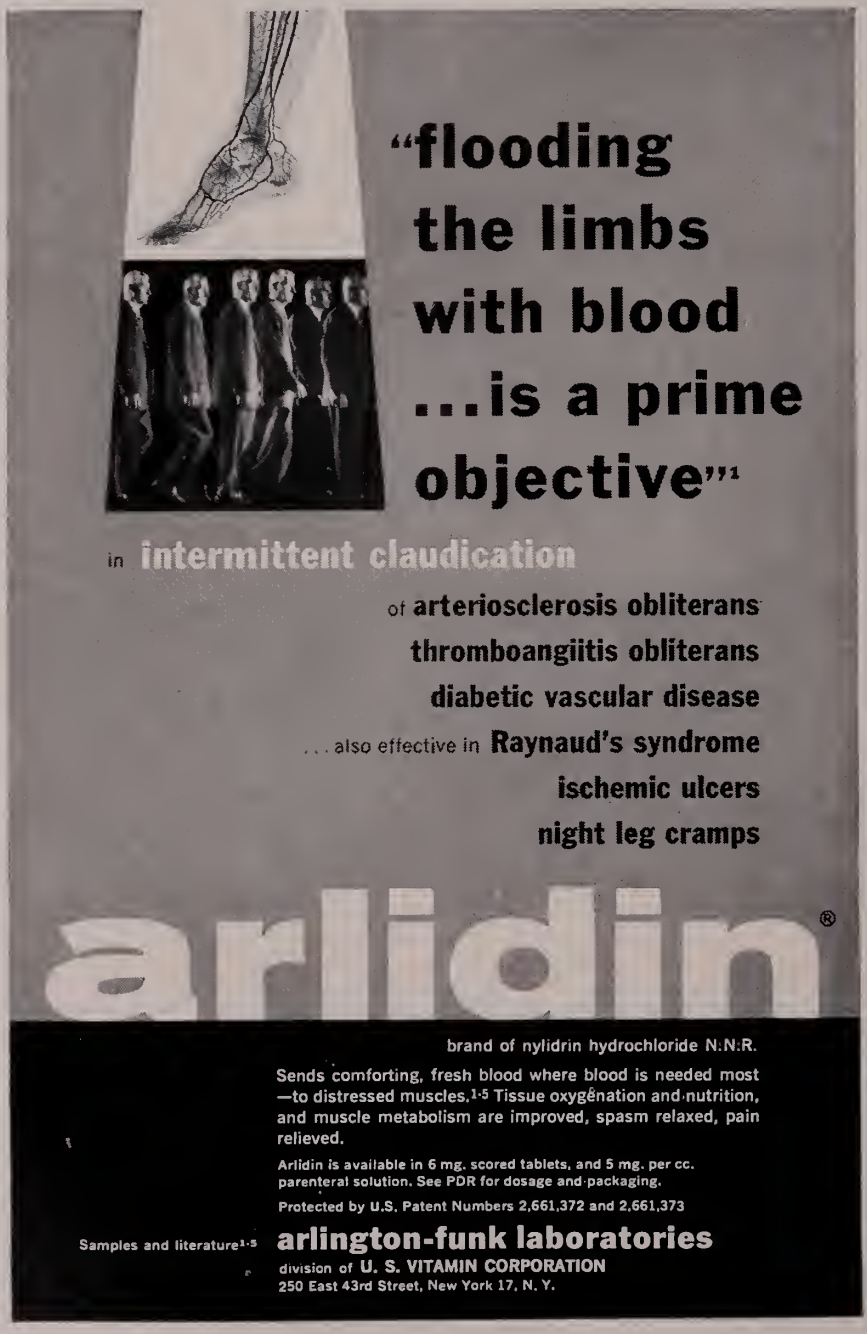
Effects of this united front action should be felt when Congress takes up the Forand bill and other legislation pointed toward relief for the aged.

Notes:

American Medical Association is asking Congress to strengthen the Civil Aeronautics Administration's medical department so it can properly supervise fliers' physical examinations and advise on other aviation medical matters. AMA also is recommending that an office of civil air surgeon and a medical research laboratory be established within CAA.

(Continued on page 674)

(Continued from page 673)



Congress has under consideration several plans for reorganizing the Defense Department, two of which would result in elimination of the office of Assistant Secretary for Health and Medical matters.

Progress on appropriations bills indicates more money for research at the Institutes of Health, and at least $121.2 million (the same as this year) for Hill-Burton hospital construction.

Andrew Biemiller, top legislative man for the AFL-CIO, told a recent delegation just returned from visiting Capitol Hill: "Congressmen are falling all over themselves in wanting to do something in the recession. I think we can cash in on this."

Testifying before a House appropriations subcommittee, Secretary Folsom said coverage under major medical insurance has gone up almost twenty-fold in the last five years.

Medicare is working up a new claim form that will have a check-list of common errors on the back; this is intended to eliminate much correspondence now necessary when the physician makes an error on the form.

BONADOXIN®

STOPS MORNING SICKNESS...BUT

...IT DOESN'T STOP THE PATIENT

BONADOXIN brings relief to 88.1% of patients...often within a few hours.[1,2] But it does not produce drowsiness, or side effects associated with over-potent antinauseants. With safe BONADOXIN, "toxicity and intolerance...[is] zero."[2]

Is she blue at breakfast? Prescribe BONADOXIN. Usually just one tablet at bedtime stops nausea and vomiting of pregnancy...

and just one supplies the full 50 mg. of pyridoxine. ⇐

EACH TABLET CONTAINS:
MECLIZINE HCl . . . . . 25 mg.
PYRIDOXINE HCl . . . . . 50 mg.
Bottles of 25 and 100.

...and for a nutritional buildup plus freedom from leg cramps*

STORCAVITE®

phosphate-free calcium, 10 essential vitamins, 8 important minerals. Bottles of 100.

*due to calcium-phosphorus imbalance

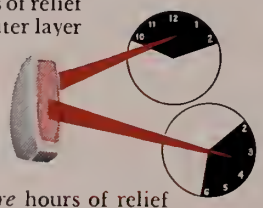
running noses . . .

caused by pollen allergies



TRIAMINIC stops rhinorrhea, congestion and other distressing symptoms of summer allergies, including hay fever. Running nose, watery eyes and sneezing are best relieved by antihistamine *plus* decongestant action — systemically — with TRIAMINIC.

This new approach frequently succeeds where less complete therapy has failed. It is not enough merely to use histamine antagonists; ideally, therapy must be aimed also at the congestion of the nasal mucosa. Triaminic provides such effective combined therapy in a single timed-release tablet.

TRIAMINIC brings relief in minutes—lasts for hours. Running noses stop, congested noses open—and stay open for 6 to 8 hours.

Triaminic provides around-the-clock freedom from allergic congestion with just one tablet t.i.d. because of the special timed-release design.

first—3 to 4 hours of relief from the outer layer

then—3 to 4 *more* hours of relief from the inner core

Dosage: One tablet in the morning, mid-afternoon and at bedtime. In postnasal drip, one tablet at bedtime is usually sufficient.

Each timed-release TRIAMINIC Tablet contains:

Phenylpropanolamine HCl	50 mg.
Pheniramine maleate	25 mg.
Pyrilamine maleate	25 mg.

TRIAMINIC FOR THE PEDIATRIC PATIENT

TRIAMINIC Juvelets*, providing easy-to-swallow half-dosages for the 6- to 12-year-old child, with the timed-release construction for prolonged relief.

TRIAMINIC Syrup, for those children and adults who prefer a liquid medication. Each 5 ml. teaspoonful is equivalent to ¼ Triaminic Tablet or ½ Triaminic Juvelet.

Mosby Co., St. Louis. 1958.

General Pathology—Based on Lectures Delivered at the Sir William Dunn School of Pathology, University of Oxford. Ed 2. Edited by Sir Howard Florey, Professor of Pathology. 932 pp. Illustrated. Price $16.00. W. B. Saunders Co., Philadelphia and London. 1958.

REVIEWS

Books reviewed in the columns of Northwest Medicine may be borrowed by any subscriber. Write Miss Ruth Horlomert, Librorian, King County Medicol Society Library, Room 121, Cobb Bldg., Seattle 1, Wn. The library oppreciotes, but does not demond, reimbursement for postoge.

CHEMISTRY OF BLOOD COAGULATION. By Paul Morawitz, Marburg, Germany. Translated by Robert C. Hartmann, M.D., and Paul F. Guenther, Ph.D., from the Departments of Medicine and German, Vanderbilt University, Nashville, Tennessee. 194 pp. Price $4.50. Charles C Thomas, Springfield, Ill. 1958.

Paul Morawitz was 26 years old when he published this review on "Die Chemie der Blutgerinnung" in 1905. The article was outstanding in its critical and mature review of the hopelessly confused field of coagulation, and the young author put it all together in what is now the classical theory for the coagulation of blood. His theory is still the unshaken basis for the more fancy modern concepts. No student of coagulation should allow himself to remain ignorant of this work. The reading will provide new ideas and prevent the laborious "discovery" of facts already known. Probably, it will also create a somewhat more humble sense of proportions in this field of medicine. For this reason, any student or physician with academic interests will enjoy the reading of this book.

It is a sad fact that this work can no longer be understood in its original language (Morawitz himself cites freely from the Latin, French, English, Italian, and German literature). The translators have done a careful and painstaking work, preserving the original style of the author, and yet their language is well balanced and easily read. The footnotes give modern comments where needed, and the bibliography with its 490 entries has been brought up to modern library standards.

I wish to congratulate the publisher and the translators for this book. Let it be the first in an inexpensive series of "Classics in Hematology."

Peter F. Hjort, M.D.

GENERAL PATHOLOGY. Ed. 2. Based on Lectures Delivered at the Sir William Dunn School of Pathology, University of Oxford. Edited by Sir Howard Florey, Professor of Pathology. 932 pp. Illustrated. Price $16.00. W. B. Saunders Co., Philadelphia and London. 1958.

This is a superb basic book for every serious student of disease. Neither a reference text for practicing pathologists, nor a book of essentials for the average medical student, it is a lucid review of the experimental evidence which has led to our present knowledge of disease processes, documented by pertinent references which are quite up-to-the-minute for a textbook, including a number of papers published in 1957. The title of the first edition of this book was Lectures on General Pathology. As is suggested by the new title, several chapters on such topics as tumors and thrombosis have been added in this second edition to make the book more complete. Based upon lectures given to advanced students at Oxford, its chapters are monographed by experienced investigators who have contributed new knowl-

(Continued on page 680)

(Continued from page 679)

edge to their special fields. The editor, Nobel prize winner Sir Howard Florey, Professor of Pathology at Sir William Dunn School of Pathology at the University of Oxford, has written 10 of the chapters himself; 14 collaborators provide the other 33 chapters. The style is straightforward and clear and there is little tendency to fill with speculation the gaps that exist in our knowledge. Many explanations are given "in an unashamedly teleological way" as McFarland says in his discussion of blood coagulation, and elsewhere the teleological point of view seems to creep unannounced into the discussion. Some readers may be indifferent to this or find it helpful, but others may agree with me and regard it as unnecessary and distracting.

This book should provide great pleasure to any physician who likes to consider disease processes in their basic terms, and to the superior medical student interested in experimental work it should be a valuoble source of fundamental information and stimulation.

Gordon LaZerte, M.D.

THE PLACEMENT OF ADOPTIVE CHILDREN. By J. Richard Wittenborn, University Professor of Psychology and Education, Rutgers University, New Brunswick, New Jersey. Assisted by Barbara Myers, Research Assistant in Sociology and Psychology, Yale University. 189 pp. Price $4.75. Charles C Thomas, Springfield, Ill. 1957.

I can not agree, as the cover states, that this book gives definite answers to the many questions raised by adoption. Indeed as stated in the conclusion, "Unfortunately research does not provide such answers."

If there were fewer apologies for the weakness of research in this diffuse and nebulous field, the book would be much more readable. To me this is an exceedingly important area of social endeavor about which we know little. The table of contents suggests the answer can be found here—i.e., "The evaluation of adoptive parents," "Matching adoptive parents with adoptive children," "Independent placements" and so forth.

Using a direct quote from the conclusion: "Since our primary research is relevant to matters of social significance our readers will tend to expect us to provide answers which are unambiguous in their implication, free from alternative interpretation and comprehensive in their applicability." Though the book does not provide such answers and is at times wordy and difficult to follow, I would still feel it is recommended reading for those concerned in any way with adoption.

This should be required reading for all physicians who engage in direct and independent adoption that they may fully understand the magnitude of the problem.

Charles W. Day, M.D.

AIDS TO OPHTHALMOLOGY. Ed. 11. By P. McG. Moffatt, M.D. (Lond.), M.R.C.P., F.R.C.S. (Eng.), D.O.M.S., Consultant Ophthalmic Surgeon and Lecturer, Moorfields Eye Hospital, Hammersmith, West London and St. Mark's Hospital Groups; Lecturer, Post-Graduate Medical School; Recognized Teacher of London University; Senior Ophthalmic Consultant and Adviser, London County Council Central Medical Staff. 282 pp. Illustrated. Price $3.00. Wiiliams & Wilkins Co., Baltimore. 1957.

This textbook, which is written in the traditional easy flowing English style, covers ophthalmology in a neat, exacting and concise manner. The commonly seen eye conditions and also many of the rarer entities are discussed briefly but adequately for the beginner in ophthalmology. The author is faithful to the old established ocular remedies although by frequently revising the textbook he is able to add

This facility provides an informal atmosphere seldom found in hospitals elsewhere. A sound and scientific approach to emotional problems is provided with careful deliberation, with the patients' best interests given every consideration. Our approach is eclectic with emphasis along the lines of dynamic and psychobiologic psychiatry. Every recent therapy is available.

Individual services are amply provided for; in individual cottages if desired, so that the patient's every need is considered.

All diagnostic and ancillary consultative services are available.

Information upon request.

newer aids in treatment, such as the antibiotics and the steroids. Several chapters are devoted to objective examinations of the eye and determination of and correction of refractive errors. Perhaps the author goes into more detail in this latter subject than is necessary for the physician who does not make ophthalmology his career. A very useful final chapter, which deals with the visual requirements of various branches of the military and other vocations of the United Kingdom, is included. I recommend this volume as a handy reference to any medical practitioner who already does not possess a suitable ophthalmologic textbook. It seems likely that this work will remain a popular text through subsequent editions.

Louis J. Sarro, M.D.

PRINCIPLES OF OPHTHALMOSCOPY. By John K. Erbaugh, M.D., Norristown, Pa. 69 pp. Illustrated. Price $5.50. Charles C Thomas, Springfield, Ill. 1958.

This is a small book of some 59 pages, exclusive of an appendix which is devoted to the optical principles of ophthalmoscopy. The first chapter of four pages is devoted to opacities of the ocular media. The second chapter is devoted to a description of the disc, both in normal states and in pathologic states. Included in this chapter is a very concise description of the ophthalmoscopic changes of glaucoma. Chapter three is devoted to a description of changes in the blood vessels of the fundus. The fourth chapter is given to descriptions of retinopathies with discussions and descriptions of hemorrhages, macular stars, colloidal sclerosis, macular degeneration, drussen, exudates, and microaneurysms.

STOP
SPASM
PAIN
DEPRESSION

in
LOW-BACK ACHE

Disipal®*

Brand of Orphenadrine HCl

In muscle spasm due to sprains, strains, herniated intervertebral disc, fibrositis, noninflammatory arthritic states and many other musculoskeletal disorders, the first demand is for relief. Disipal fills this need. It is quickly effective in skeletal muscle spasm almost regardless of origin. Its mood-alleviating effect braces the patient against the depression so often accompanying severe pain of any type.

Dosage: 1 tablet (50 mg.) t.i.d.

In Parkinsonism

Highly selective action...energizing against weakness, fatigue, adynamia and akinesia...potent against sialorrhea, diaphoresis, oculogyria and blepharospasm... lessens rigidity and tremor... alleviates depression...safe ...even in glaucoma.

*Trademark of Brocades-Stheeman & Pharmacia. U.S. Patent No. 2,567,351. Other patents pending.

EFFECTIVE AGAINST A WIDE RANG

CHLOROMY

COMBATS MOST CLINICALLY IMPORTANT PATHOGENS

In vitro studies continue to show that a wide variety of gram-positive and gram-negative microorganisms are highly sensitive to CHLOROMYCETIN (chloramphenicol, Parke-Davis).[1-9]

Clinically, CHLOROMYCETIN "...has proved to be a particularly valuable agent in urinary tract infections," where it is often effective against microorganisms resistant to other antibiotics.[10] Among other infections against which CHLOROMYCETIN has produced excellent response are severe staphylococcal wound infections,[5] *Hemophilus influenzae*[11] and *Hemophilus pertussis*[12] infections, and dysenteries caused by salmonellae and by shigellae.[12]

CHLOROMYCETIN is a potent therapeutic agent and, because certain blood dyscrasias have been associated with its administration, it should not be used indiscriminately or for minor infections. Furthermore, as with certain other drugs, adequate blood studies should be made when the patient requires prolonged or intermittent therapy.

"Doctors can't help shingles?"

Physicians who have used PROTAMIDE extensively deplore such statements as unfortunate when they appear in the lay press. They have repeatedly observed in their practice quick relief of pain, even in severe cases, shortened duration of lesions, and greatly lowered incidence of postherpetic neuralgia when PROTAMIDE was started promptly. A folio of reprints is available. These papers report on zoster in the elderly—the severely painful cases—patients with extensive lesions. PROTAMIDE users know "shingles" *can* be helped.

PROTAMIDE®

Sherman Laboratories
Detroit 11, Michigan

Available: Boxes of 10 ampuls—prescription pharmacies.

THESE Visette owners are increasingly making the 'cardiogram a part of many examinations in patients' homes, at hospitals, plant clinics — wherever the need is indicated. Its 18 pound weight and "briefcase" size allow the Visette to go along on these calls as readily as an instrument bag. Tests are made quickly and easily because of such typical Visette features as all accessories right at hand in the cover compartments . . . automatic grounding by push-button control . . . lead selection by simply turning a knob, with automatic stylus stabilization between leads . . . "double-check" standardization signals . . . instantly visible, inkless record made by a heated stylus . . . convenient "writing table" surface for making test notations on the record. And Visette performance stays accurate and reliable, as a result of rugged mechanical construction . . . the use of modern electronic components including transistors and aircraft type ruggedized tubes . . . and a smaller, more durable recording assembly.

If, like this growing number of your colleagues, you feel your practice would benefit by such convenient 'cardiography, ask your local Sanborn Representative for complete information and a Visette demonstration. Or for descriptive literature, write Sanborn Company, attention Inquiry Director.

Just one year after introduction . . .

more than 2000 doctors already know

the convenience and value of "VISETTE" 'cardiography

Sanborn Model 300 Visette electrocardiograph $625 delivered, continental U.S.A.

Model 51 Viso-Cardiette, "office standard" in thousands of practices, remains available at $785 delivered, continental U.S.A.

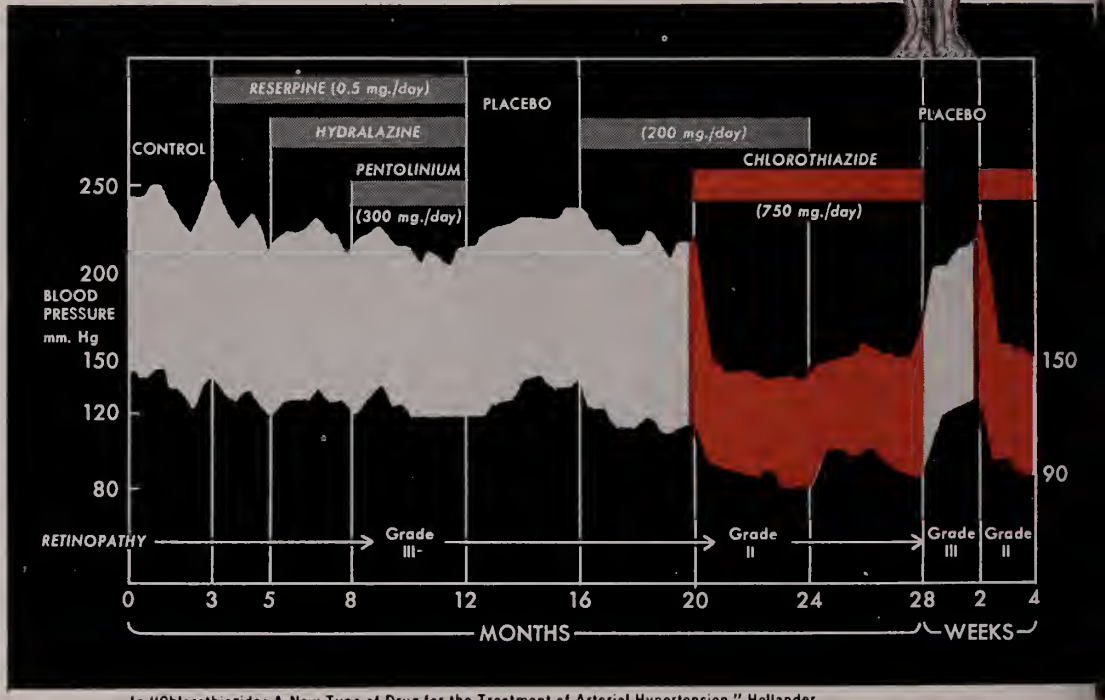
Investigator

after investigator report



Wilkins, R. W.: New England J. Med. **257**:1026, Nov. 21, 1957.

"Chlorothiazide added to other antihypertensive drugs reduced the blood pressure in 19 of 23 hypertensive patients." "All of 11 hypertension subjects in whom splanchnicectomy had been performed had a striking blood pressure response to oral administration of chlorothiazide." ". . . it is not hypotensive in normotensive patients with congestive heart failure, in whom it is markedly diuretic; it is hypotensive in both compensated and decompensated hypertensive patients (in the former without congestive heart failure, it is not markedly diuretic, whereas in the latter in congestive heart failure, it is markedly diuretic). . . ."

Freis, E. D., Wanko, A., Wilson, I. H. and Parrish, A. E.: J.A.M.A. **166**:137, Jan. 11, 1958.

"Chlorothiazide (maintenance dose, 0.5 Gm. twice daily) added to the regimen of 73 ambulatory hypertensive patients who were receiving other antihypertensive drugs as well caused an additional reduction [16%] of blood pressure." "The advantages of chlorothiazide were (1) significant antihypertensive effect in a high percentage of patients, particularly when combined with other agents, (2) absence of significant side effects or toxicity in the dosages used, (3) absence of tolerance (at least thus far), and (4) effectiveness with simple 'rule of thumb' oral dosage schedules."

In "Chlorothiazide: A New Type of Drug for the Treatment of Arterial Hypertension," Hollander, W. and Wilkins, R. W.: Boston Med. Quart. 8: 1, September, 1957.

the effectiveness of 'DIURIL' (CHLOROTHIAZIDE) in Hypertension

as simple as 1-2-3

1 **INITIATE THERAPY WITH 'DIURIL'.** 'DIURIL' is given in a dosage range of from 250 mg. twice a day to 500 mg. three times a day.

2 **ADJUST DOSAGE OF OTHER AGENTS.** The dosage of other antihypertensive medication (reserpine, veratrum, hydralazine, etc.) is adjusted as indicated by patient response. If the patient is established on a ganglionic blocking agent (e.g., 'INVERSINE') this should be continued, but the total daily dose should be immediately reduced by as much as 25 to 50 per cent. This will reduce the serious side effects often observed with ganglionic blockade.

3 **ADJUST DOSAGE OF ALL MEDICATION.** The patient must be frequently observed and careful adjustment of all agents should be made to determine optimal maintenance dosage.

SUPPLIED: 250 mg. and 500 mg. scored tablets 'DIURIL' (chlorothiazide); bottles of 100 and 1,000.

'DIURIL' is a trade-mark of Merck & Co., Inc.

Smooth, more trouble-free management of hypertension with 'DIURIL'

HOW DIURETICS ACT

Primarily by regulation of bicarbonate transport	DIAMOX acetazolamide
Primarily by regulation of chloride transport	mercurials chlorothiazide

LEDERLE LABORATORIES, a Division of AMERICAN CYANAMID COMPANY, Pearl River, New York

*Reg. U. S. Pat. Off.

BOTH BASIC DIURETIC REGIMENS

MOX*

ACETAZOLAMIDE LEDERLE

1

Advantages of DIAMOX in single-drug diuresis

DIAMOX—operating through the well-understood mechanism of *bicarbonate* transport regulation—provides ample, prolonged diuresis in the great majority of patients.

DIAMOX is virtually non toxic . . . has not caused renal or gastric irritation . . . has no pronounced effect on blood pressure. It is rapidly excreted, does not accumulate in the body, permits convenient dosage adjustment, allows unbroken sleep. Small, tasteless, easy-to-take tablets . . . usual dosage, only one a day.

CARDIAC EDEMA

PREMENSTRUAL TENSION

EDEMA OF PREGNANCY

OBESITY

2

Advantages of DIAMOX in intensive, two-drug diuresis

When intensive diuresis must be maintained, DIAMOX, alternated with an agent for regulation of *chloride* transport, has proved a regimen of choice. Through dual *bicarbonate-chloride* regulation, it produces maximal sodium-water excretion with minimal distortion of serum electrolyte patterns, greater patient comfort, lessened risk of induced drug resistance.

ADVANCED CONGESTIVE HEART FAILURE

REFRACTORY TOXEMIA OF PREGNANCY

Reports from Investigators

In medical student volunteers, 'Deaner' produced increased daytime energy and attentiveness at lectures, sounder sleep (with a reduction in the hours of sleep needed), better ability to concentrate on both studying and writing, decreased apprehensiveness prior to and during examinations, a more affable mood and outspoken personality.

1. Murphree, H.B., Jr.; Jenney, E.H., and Pfeiffer, C.C.: 2-Dimethylaminoethanol as a Central Nervous System Stimulant. Presented before Assoc. for Research in Nervous and Mental Disease, New York, Dec. 12-14, 1957. To be published.

In Exhaustion and Depression—In a study of over 100 patients suffering from various psychiatric disorders, especially exhaustion and mild depression, the clinical effect of 'Deaner' was to increase energy and to relieve depression in over 70%.

2. Lemere, F., and Lasater, J.H.: Am. J. Psychiat. *114*:655 (Jan.) 1958.

In Learning Problems—Some of the children with reading problems and other learning defects have improved markedly during their treatment with 'Deaner'.

the Anti Depressant

Deaner™

2-dimethylaminoethanol (deanol)

A Totally New Molecule for the Treatment of

Chronic Fatigue States
Mild Depression
Chronic Headache
Migraine
Neurasthenia

In extensive clinical trials, DEANER has proved to be of value in that large contingent of patients with vague, undefined symptoms, who feel under par and lack energy or are mildly depressed.

Patients with chronic headache including migraine are benefited.

Advantages of 'Deaner'

Effects come on gradually and are prolonged . . .

Without causing hyperirritability, jitteriness or emotional tension . . .

Without causing excess motor activity . . .

Without causing loss of appetite . . .

Without elevating blood pressure or heart rate . . .

Without sudden letdown on discontinuance of therapy.

Dosage

Initially, 1 tablet (25 mg.) daily in the morning. Maintenance dose, 1 to 3 tablets (25 mg. to 75 mg.) for adults; ½ to 3 tablets for children. Full benefits may require two weeks or more of therapy.

'Deaner' is supplied in 25 mg. scored tablets in bottles of 100.

For Speedier Return to Normal Nutrition

Meat...

and the Protein Depletion of Severe Infectious Disease

Recovery from severe infectious processes entails more than emergence from the effects of the causative agent. The semistarvation, the inactivity, the suppression of physiologic activity must all be corrected as rapidly and thoroughly as can be tolerated by the patient.

Return to normal nutrition can be speeded by an easily digested diet high in top quality protein and vitamin-mineral components.

Lean meat serves several purposes in such a program: It supplies easily digested protein of highest biologic quality for rapid re-establishment of nitrogen balance; it provides the gamut of B vitamins as well as certain minerals important to sound nutrition, and it brings appetite-stimulating flavor to meals, a consideration not to be underestimated in the psychic rehabilitation of appetite.

The nutritional statements made in this advertisement have been reviewed by the Council on Foods and Nutrition of the American Medical Association and found consistent with current authoritative medical opinion.

SANDOZ

CORRESPONDENCE

Internal Mammary Ligation

Portland, Oregon

EDITOR, NORTHWEST MEDICINE:

With considerable amazement I note that a procedure so ill conceived as internal mammary artery ligation continues to be described and popularized for the treatment of coronary heart disease. Already, many of these patients so treated by some of our over-zealous surgical colleagues are coming home to roost. This in no way bears any reflection upon the surgical ability of these people but rather underlines the necessity for a more objective approach to the problem of evaluating any newly-publicized therapeutic tool in the treatment of coronary disease.

Almost every therapeutic agent in the treatment of coronary disease, even placebos, has been associated frequently with initial good results if recommended with sufficient enthusiasm. Unfortunately, these good results are usually measured in terms of subjective responses even though objectively demonstrable continued myocardial deterioration may be the case when these patients are followed sufficiently long.

In the April issue the article on Internal Mammary Ligation describes several cases in which immediate relief was noted following this procedure. The follow-up period in this series as well as others now appearing in the literature is much too short to allow a proper evaluation of this surgical procedure for the management of coronary disease. It seems almost inconceivable that such immediate symptomatic improvement as is reported in this paper and in others can be based on anatomic and physiologic factors.

I would call your attention to a recent paper (Adams, R., Internal mammary ligation for coronary insufficiency, New England J. Med. 258:113-115, Jan. 16, 1958) in which the author attempts to separate fact from fancy in evaluating the results following internal mammary artery ligation. While the number of cases are only a few, the method is truly objective and sheds a great deal of light on the problem. At operation in a few cases, each internal mammary artery was exposed and a ligature placed but not tied. After an initial assessment of the effects from the operative procedure alone, the ligatures were tied and further evaluation made. It is noteworthy that pain disappeared in these cases before the internal mammary arteries had been ligated but after the patients thought they had been ligated. In a further appraisal of this problem the authors were unable to verify the claim made by the proponents of this procedure that the minute volume of flow from the pericardiophrenic artery is increased following occlusion of the internal mammary artery. Even if such increased flow resulted from this procedure, it has only been presumed by proponents that this increased flow finds its way into the coronary arterial system in an effective fashion.

Hinton, Lord and associates have attempted to measure this presumed increased coronary blood flow in dogs following the ligation of the internal mammary arteries. This was done by diverting all the blood from the heart to a heart-lung machine and placing a catheter in the right ventricle. All the blood reaching the catheter came, primarily, from the coronary sinus and the thebesian veins. Since the aorta and the pulmonary artery were occluded, the blood draining from the catheter placed in the right ventricle could reach the heart only as a result of the procedure. No increase in blood supply was found following the ligation of the internal mammary arteries in contrast to a 3-5 per cent increase after abrasion of the heart wall and talc powdering.

In another study reported by Dimond and associates, alternate patients were subjected to a sham operation without ligation of the internal mammary arteries. It is interesting to find that the clinical results in those subjected to sham operations were equally as good and in some even better than in those in whom the internal mammary arteries had been ligated.

A more critical and objective approach to the problem of surgery in the treatment of coronary disease is needed if one is to separate fact from psychosomatic fancy. The fact that the procedure is a simple one to perform does not permit us to recommend it to our patients with reckless abandon. Any operative procedure, no matter how simple, is associated with greater hazards and risk in this group of cardiac patients. Every surgical procedure recommended for the treatment of coronary disease should have some sound physiologic basis to permit one to anticipate a greater or lesser beneficial effect upon the clinical course of the disease. There is reason to believe that this surgical procedure will disappear from the medical scene with the passage of time by virtue of its unsoundness and ineffectiveness. It would seem prudent to await further developments in this field rather than to recommend this procedure indiscriminately to those suffering from coronary disease.

Very sincerely yours,
Marvin Schwartz, M.D.

In Praise of Group Practice

EDITOR, NORTHWEST MEDICINE:

You would not expect a very receptive response to your April editorial on a clinic letterhead, and I guess I am not prepared to give you such. Your position is

(Continued on page 710)

(Continued from page 709)

carefully thought out, and fairly and objectively expressed, and I am impressed by it, but I can not believe that general practice is a field of endeavor for which you can train physicians adequately, or an attitude that any one doctor can assume successfully. What I do think is that the general practice attitude can be assumed by a group of specialists, combining the best features of specialist training and experience with the best features of generalist breadth and human feeling for the patient as a man and a family member.

Common sense suggests, and experience confirms it over and over again, that a man who tries to benefit his patients by "rendering care beyond the confines of a narrow field" is likely to get into trouble through unfamiliarity with the signs and symptoms and proper methods of treatment of the conditions which he sees infrequently, and in the management of which he has had no special training.

No less serious, I freely admit, is the trouble arising out of the gun-barrel vision of a specialist who cannot or will not see a patient as a human being, but only as the repository of a disease entity. Here the necessity for what you properly call the "general practice attitude" is obvious. But for this specialist to step out of his field and start advising the patient about his or her orthopedic, gynecologic, cardiac or other trouble, is apt to be just as productive of mismanagement as for the GP to do so. Mother Nature protects people, of course, to a great extent, and so this does not often lead to serious things; but it can.

I submit that group practice avoids both hazards (score one for me for not alluding to Scylla and Charybdis!) *if* the men in the group individually never forget to regard each patient as a whole human being, and if their aim is medical service, jointly rendered, rather than prosecution of individual specialties and research projects. An internist, a gynecologist, a surgeon, even a dermatologist may properly act as a family medical adviser in such a setting, with one charge for one visit for one complaint, regardless of whether one, two or five doctors are needed to properly evaluate the patient's problem and prescribe treatment.

If a general practitioner is a skillful surgeon, ten to one he is hopelessly incompetent as a dermatologist or otologist, or orthopedist, except perhaps when dealing with the most commonly encountered problems. And his "egotism of a most intense kind," as Osler called it, will make it hard for him to recognize the situations in which he needs a little help. Even in such a group as I have described (I was describing our own), this can and does happen on occasion. But it happens a lot less often than it does in solo practice.

Orienting medical schools to the "general practice attitude" is a highly constructive suggestion. But orienting them to turning out general practitioners would be a backward step. And calling general practice an attitude because you think it should be an attitude does not make it one. It is still an area too—an area in which doctors decline to acknowledge their comparative incompetence in any medical field except a few in which it would surely lead to prompt disaster: neurosurgery, perhaps—though even there they may fail to turn in an adequate diagnostic performance, without even knowing it. To whom does the average GP turn, if he has a coronary, or a Jacksonian convulsion, or a visual field defect? Very seldom to his GP colleagues, I suspect. They are not good enough. And if they are not good enough for him, they are not good enough for the American public—not, at least, if something better can be made available. And it can, in time.

This is not for signed publication, of course; there might be some confusion as to the identity of the men I would gladly offend by it and those whom I do not mean and would not want to offend. It is too verbose anyhow, being written in a hurry. But I think it fairly expresses my reaction to your thought-provoking editorial and the correspondence it aroused.

Cordially yours,

P.S. Davison seems to be describing a more plausible fellow: a medical GP who would do internal medicine, pediatrics, preventive medicine and a little psychiatry and social work, but little or no surgery. Where groups are not feasible, this seems unobjectionable—but not where they are feasible. Training as broad as this can not be as deep as it needs to be nowadays.

Citing first responsibility to his group, author of the above letter requested that his name not be made public. Ed.

Private Practice in Italy

Hotel Londres Beau Rivage
Venice, Italy
1 May, 1958

Editor, Northwest Medicine:

We have been having a most pleasant vacation. The whole trip (Lisbon—Madrid—Paris—Geneva—Cannes—Florence—Rome—Venice) has been very exciting. We have driven here from Geneva and will drive back to Switzerland. The highways make the Oregon Coast Highway look like a straight line and are rough on the labyrinth but driving has otherwise been easy.

Until today, I had not contacted anything medical. I had met a Dr. Angelo Sperio, an internist in private practice here and chief of medicine at the civilian hospital here, and visited him today. Comparisons were most interesting. I find that Italy has no socialized medicine but that many patients belong to one of four or five large insurance companies. When they do, the patient pays a monthly fee and the doctor always takes the fee the insurance company pays, which fee is paid by the insurance company directly to doctor. Private patients in the office pay, for an average return visit, 3,000 lires (about $5) unless they have insurance, and four to five times that for an initial work-up. Welfare patients who are sent by the welfare doctor are paid on a welfare fee schedule. I was not able to get details.

The local hospital, an ex-monastery, is owned by the

(Continued from page 710)

city of Venice and run by administrators. All private and welfare, and all service connected veteran patients are hospitalized here. If the patient has no insurance, he must pay private fees. If he is insured, the insurance pays (and time did not permit my host to enlarge on this). If welfare, the Italian National Government pays the hospital, as for veterans. However, if a private patient goes to the hospital, he pays the hospital for his medical care. The hospital board then pays the attending doctor at much smaller rates than the $5 per day office visit (I gather government rate varied, but was usually less than half).

There has been some political agitation in Italy for socialized medicine but not much. They feel it unlikely in near future. They feel Italian doctors are much better off than are the German or British doctors.

The medical income in Italy is divided as about in the U.S. (Internists here also are convinced that they deserve greater recognition, I may add!!)

Interestingly, there are over 800 doctors for some 300,000 people here. Dr. Sperio owns neither boat nor car. He walks to house calls. Venice is so compact that most areas are within 15 minutes fast walking.

Veterans in Italy are compensated only if a board of army doctors decides they have a service connected problem. There is no Veterans Administration, medical corps or hospital system as we know it. Veterans go to private hospitals.

Dr. Sperio's son is a second year medical student. In Italy there are five year primary schools for all, and eight year "gymnasiums" or secondary schools. Then, he went directly to a six year medical school—no college in between. Once he has passed examinations he will be entitled to practice medicine in Italy. Most young doctors spend two to four years in hospital first, however.

Regards.

Heyes Peterson, M.D.

Remodeling the AMA

When an organization is to be remodeled, it is necessary to follow much the same course usually followed in remodeling a building. First step is to examine the existing structure to determine what parts are serving useful purpose and what must be removed before modernization begins. Sometimes it is necessary to redefine the purposes for which the structure exists. The American Medical Association is being subjected to this kind of scrutiny at the present time. Extensive remodeling is in prospect.

This does not mean that the Association is failing to meet its obligations but it does mean that its services to the public and to the profession will be improved. The prospect should be pleasing to its critics as well as to its staunch supporters.

Need for critical examination of AMA purposes, as well as structure, was seen by the firm of Robert Heller and Associates when making recommendations contained in what is now known as the Heller Report. The Heller group had been retained by AMA Board of Trustees to make a business management survey of the Association, particularly of operation of the Chicago headquarters. The Report had been prepared at the time of the 1957 meeting in New York but not in time for any consideration at that session. At the conclusion of the New York meeting, Vincent Askey, Speaker of the House of Delegates, appointed a study committee, headed by William Hyland, Michigan, to go over the Report preparatory to submitting it to the House at Philadelphia in December. Further activities have followed in natural sequence. A second study committee is now gathering information on questions raised but not answered by the Heller organization. They concern factors other than business management.

Lewis A. Alesen, California, is chairman of the study committee now seeking opinions on four points listed in the Heller Report. Their genesis is best explained in the words of the Report itself:

> In meetings with officers and members during the course of this work, comments and opinions were received that went beyond the range of organizational and administrative problems. They showed that many in the ranks of the AMA are looking to the future and thinking in terms of broad policy and the course the Association should follow.
>
> Although not part of the assignment, these views should be of concern to those who guide the Association and they are therefore dealt with in this section. The more significant of them can be reduced to four specific actions to which it is recommended the Association give consideration. They are:
>
> 1. Redefine the central concept of AMA objectives and basic programs.
>
> 2. Place more emphasis on scientific activities.
>
> 3. Take the lead in creating more cohesion among national medical societies.
>
> 4. Develop an AMA concept of the best type of medical care for American families.

It is interesting that first position is given to the problem of AMA basic objectives and programs. Two paragraphs appeared under the first heading in the original Report. They emphasize the great, and so far unmet, need for all members to understand what the AMA actually is, what it does and how its work is done. The two paragraphs follow:

> There appears to be a general understanding among officers and staff as to the broad purpose of the work being done in medical education, scientific inquiry, social and economic problems of the medical profession, legislative issues, and public relations. Apparently, however, there is at present no unified concept, clearly understood throughout the Association and its membership, as to the main goals and the kind of programs needed to achieve them.
>
> A comprehensive and perceptive analysis of members' views seems to be needed. The collective aspirations of the group could then be determined and a clear-cut, written concept of principal goals drawn up in the light of today's needs. This then would guide the entire organization in planning specific programs for attaining the goals.

A questionnaire designed by the Alesen Committee has been sent to all officers, trustees, members and alternate members of the House, and members of councils and committees as well as to presidents of state organizations and to state medical journals. No doubt, any one of the above individuals would welcome opinions on the four points raised in the Heller Report. True cross section of member opinion is urgently desired by the committee.* •

*Members of the study committee are: Lewis A. Alesen, 124 S. Las Palmas Ave., Los Angeles 4, Calif.; James Z. Appel, 305 N. Duke St., Lancaster, Pa.; Thurman B. Givan, 115 Remsen St., Brooklyn 2, N. Y.; Hugh H. Husey, Jr., 3354 Styvesant Place, N. W., Washington 15, D. C.; Raymond M. McKeown, 510 Hall Bldg., Coos Bay, Ore.; and Milford O. Rouse, 1719 Pacific Ave., Dallas 1, Texas.

The Reasons for Our Existence

A letter published in the correspondence section of this issue should serve as an all-time example of one of the purposes of medical publication. It discusses ligation of the internal mammary artery. Those who are insecure, in the sense of that word as it is used by psychiatrists, will see in it a letter of criticism and will obtain from it a certain amount of discomfort. Those more mature individuals, who are able to disagree without emotional upheaval, will find it a delightful discussion of a current problem and the kind of intelligent disagreement which leads to progress through stimulation of thought. Founders of this journal had exactly this process in mind when they first talked of a medium of communication in the then isolated Pacific Northwest, nearly 60 years ago.

After several years of discussion, the first issue of NORTHWEST MEDICINE appeared in January 1903. Title of the first editorial was The Reason For Our Existence. Third paragraph of that editorial was as follows:

> **Furthermore, the existence of a monthly journal in a certain section offers a special inducement to members of the profession, tributary to it, to crystalize their views and experiences into definite expressions of thought for the benefit of their fellow physicians. Any man of intelligence and spirit aspires, at times, to withdraw from communion with himself and engage in contact with the minds of his peers, displaying his own independence of thought and belief. This form of journal stands as a stimulus to this kind of individual action in the region where it is placed.**

After more than half a century of continuous publication this journal has made a number of changes in appearance but none in its purposes. One of them is to provide the medium of communication its first editor, Clarence A. Smith, had in mind when he wrote the first editorial. Its pages are open to those who will make the effort to use them. •

Components

Not many members of the American Medical Association realize the extent of activities of the world's greatest medical organization or the component parts through which it now functions. Each of the following entities has specific duties and renders specific service:

Bureau of Health Education
Bureau of Medical Economic Research
Committee on Legislation
Council on Constitution and Bylaws
Council on Industrial Health
Council on Medical Education and Hospitals
Council on Medical Service
Council on Mental Health
Council on National Defense
Council on Rural Health
Council on Scientific Assembly
Department of Public Relations
Division of Councils of Therapy and Research
Council on Drugs
Council on Foods and Nutrition
Council on Medical Physics
Bureau of Investigation
Chemical Laboratory
General Manager's Office
Law Department
Judicial Council
Records and Circulation Department
Scientific Publications & Library
Today's Health
Washington Office

Those who wish to know more about the duties and services of these components may address inquiry to this journal. Information is available or will be obtained. •

New Secretary of Health, Education and Welfare

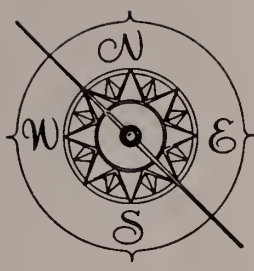
Government management and education have been the fields of interest of Mr. Arthur S. Flemming, who will replace Mr. Marion B. Folsom as Secretary of HEW. Secretary Folsom has resigned because of his health and will relinquish the office in July or August. He assumed the post in August 1955.

Mr. Flemming served nine years on the Civil Service Commission under President Franklin Roosevelt. During the Korean War he served in the Office of Defense Mobilization under President Truman. He was head of ODM from 1953 to 1957. Before inauguration, President Eisenhower named Mr. Flemming to a three man committee on government reorganization which committee is still active. Between periods of government service, he held posts at American University and at Ohio Wesleyan. He was first lay president of the latter school.

Reports indicate that he is an organization man who prefers to avoid controversy but works best as a member of a group. Friends rate him high as an authority on government and consider his ability outstanding. He is a believer in modern Republicanism and a staunch defender of administration policy. •

routine checks verify clinical accuracy

Every lot of 'Tes-Tape' (Urine Sugar Analysis Paper, Lilly) is subjected to a panel of ten persons at the Lilly Research Laboratories who are unfamiliar with the use of 'Tes-Tape.' Each panel member examines twenty-five urine specimens containing different concentrations of glucose. When last computed, the average accuracy of the observations at the designated levels was as follows:



Glucose Concentration	Accuracy
2 percent	98.6 percent
0.5 percent	88.9 percent
0.25 percent	90.3 percent
0.1 percent	95.6 percent
0 percent	100 percent

A total of 5,500 different specimens were assayed, with an over-all accuracy of 98.6 percent.

Available at all pharmacies in plastic dispensers of approximately 100 tests.

Uterine Cancer

Advances and Unsolved Problems in Treatment

JOHN STALLWORTHY, F.R.C.S., F.A.C.S. (HON.)
OXFORD, ENGLAND

The best is not good enough! Nowhere in medicine is this working principle more necessary than in the treatment of cancer. Failure to accept it has arrested progress, and on occasions divided with bitterness those who should have united in a common cause as is illustrated by the history of the therapeutic attack on uterine carcinoma. Fortunately the combined skills of the family doctor, the cytologist, the pathologist, the surgeon and the radiotherapist are now being used as never before in a concerted attack on pelvic malignant disease, and the results achieved in a relatively short time are encouraging.

Historic Background

The woman with cervical carcinoma had little hope of survival until 60 years ago. Growths were cauterised, cervices amputated, and uteri removed by both the vaginal and abdominal routes, but these heroic procedures were reserved for the few. Fraught with grave dangers they offered little chance of cure. It was recognized that cervical growths metastasised to pelvic glands and that survival of the primary hysterectomy (a rare event in the early series) was followed too often by recurrent disease. As early as 1787 a Gottingen professor proposed abdominal hysterectomy for uterine cancer and in 1825 Langendeck performed an unsuccessful operation. The year Roentgen discovered x-rays in 1895, Clark[1] at Johns Hopkins described an extended hysterectomy with removal of lymph nodes, while in Vienna, Wertheim was working on the same idea. On 16 November 1898, an historic date, Wertheim performed his first radical hysterectomy with removal of the glands and gave new hope to women with cervical cancer. His operation, with modifications, is today the most widely employed surgical technique in the treatment of this disease. Its justification was that it attempted to eradicate both the primary growth and the glands which experience had shown were commonly involved. Wertheim found nodal deposits in 25 per cent of his cases. This important fact concerning the reason for the operation should not be forgotten either when reviewing the past or when planning the future.

In the same year, 1898, Marie and Pierre Curie announced the radioactivity of pitchblende and heralded a momentous new era. Several years later the action of radiation on living tissue was realised following the famous accidental burn of Becquerel in 1901. Madame Curie isolated radium in 1902 and that year Cleaves[2] recorded a case of advanced cervical carcinoma treated with dramatic effect by 1 Gm. of radium bro-

Sommer Memorial Lecture presented at the 43rd Annual Meeting of the University of Oregon Medical School Alumni Association, Portland, Oregon, April 16, 1958.

mide. Early workers in America to record encouraging results included Morton,[3] Robert Abbe,[4,5] and Truman Abbe.[6] Lacassagne[7] and his associates explored new techniques in France, Janeway[8] and others in America, Forsell and Heyman[9] in Sweden, and in Germany, Kroenig[10] was using mesothorium. From 1898 Wertheim persisted in his surgical attempt to cure the disease. In 1913 the fifteenth convention of the German Gynecological Society at Halle included a discussion on radiation therapy. Wertheim was scheduled to speak on his results but after impressive papers had been read on mesothorium and radium, Doderlein tapped Wertheim on the shoulder and said, "My dear Wertheim, you are an historic personality, your operation will not be made any longer." It is reported that Wertheim was also impressed and cancelled his lecture.

Unfortunately, events did not justify the early claims made for radiation. One reason for this was the incidence of gland deposits and the fact that available techniques, apart from surgery, could do little for them.

The Wertheim Procedure

It was natural, therefore, that Wertheim should rely on surgery. His results are indicated in table 1. Reduction of primary mortality and

TABLE 1. CARCINOMA OF CERVIX

Surgery
Wertheim

Number of cases	Operability rate	Primary Mortality	5 Year "Cures"
1st series (1898-1916)	49%	19%	18.6%
2nd series (1916-23)	48%	13%	26.9%

increased rate of five year cures in the second series is impressive when we remember the years of war and post-war poverty during which these operations were performed. Advocates of radiation, of whom there were increasing numbers, were at times actively hostile to the surgeon and spoke of "butchery." In assessing the contribution Wertheim made, it should be remembered that he restored many women to health long before the first cures at Radiumhemmet, Stockholm, in 1911. The early terrifying primary mortality would have daunted less courageous men but when the exponents of radiation attacked this, as they continued to do through the years, they forgot or ignored the fact that Wertheim offered a cure to his early patients which was not otherwise available. The price to be paid was the danger of operative death, and postoperative fistulae, but the alternative of cancerous fistulae, pain, and misery was even more terrible. As Sir William Osler said, "What shall not be forgiven to the men who, as a direct outcome of the very operative details that have received the bitterest criticism, are saving lives that otherwise would have inevitably been lost. It has not always been professional encouragement that has supported them, but humanity owes a great debt of gratitude—a debt too great to pay, too great even to acknowledge."

In an effort to reduce the operative mortality, Wertheim's colleague Schauta perfected his extended vaginal operation. His results were most encouraging, with a higher operability rate and lower mortality. Amreich, with increasing experience, greatly extended the scope of the operation and, although his mortality rose in his later series, it will be noted that the overall salvage was greatly increased in that his operability rate rose from 41 to 73 per cent (table 2). The

TABLE 2. CARCINOMA OF CERVIX

Vaginal Surgery.

Surgeon	Operability rate	Primary Mortality	5 Year "Cures"
Schauta-Peham	54.7%	6.6%	26%
Amreich 1st series (1936-39)	41.7%	8%	36.1%
Amreich 2nd series (1939-43)	73.9%	14%	34.1%

fundamental weakness of the operation remained. As an ultimate attack on cervical cancer it was unsatisfactory in that, unlike the Wertheim technique, it ignored the glands.

Other workers, notably Werner in Vienna, Lockyer, Comyns Berkeley, and perhaps greatest of all British surgeons. Bonney in England, and later Meigs in this country, practised the Wertheim procedure with improving results, as shown in table 3. It should be remembered that

TABLE 3. CARCINOMA OF CERVIX

Wertheim Technique.

Surgeon	Operability rate	Primary Mortality	5 Year "Cures"
Werner (1939-40)	78.5%	7.9%	46%
Werner (1940-50)	76.3%	6%	48%
Bonney (500 cases)	63%	14%	40%

Bonney's large series was completed in the 1930's and included all those early cases treated when

anaesthetic facilities and pre- and postoperative care were not what they are today. I was resident at Chelsea Hospital for Women in 1936, the year Bonney performed his five hundredth Wertheim. Postoperative intravenous infusion for these cases was introduced at that late stage as a routine procedure by my colleague, John Howkins, now at St. Bartholomew's Hospital, and myself. Bonney's influence extended to the Commonwealth where Foreman and Thring in Sydney maintained the surgical attack and trained, among others, Schlink, to whom reference will be made later.

Treatment by Radiotherapy

After the 1913 Congress at Halle, radiotherapy became the generally accepted method of treatment. It was possible for surgeons, with or without training in the use of the new material, to purchase radium needles and use them as they wished. Two opposing schools of surgery and radiotherapy rapidly developed and the second was the stronger and grew rapidly. You may ask what this historic review has to do with advances in the treatment of uterine cancer. It has a great deal. There are occasions when past experience of success and failure can pave the way for dramatic contributions, and an outstanding example of this is the increasing rapprochement between radiotherapists and surgeons, after years of antagonism.

While a minority of surgical giants were operating on all possible cases, a multitude of inadequately experienced practitioners throughout the world were applying radium needles believing, as it was then falsely taught, that this was a safe procedure with no primary mortality and with results equal to the best surgery could offer. Meanwhile in selected, well equipped clinics, the giants of radiotherapy were developing. These men, with ever improving equipment and rapidly expanding knowledge, were treating cancer of all forms. It was unfortunate, but perhaps natural, that when reference was made to the part surgery could play, only the results of the Bonneys and Werners of this world were quoted. Their work revealed the best that surgery at that time could accomplish, but gave no indication of the bad results obtained by relatively untrained and adventuresome surgeons working in isolation away from the limelight. Similarly, when radiotherapy was discussed the results mentioned were not those of the thousands of individuals with a few radium needles or of small, poorly equipped clinics, but of Radiumhemmet, the Paris School, Manchester, the Marie Curie Hospital, or of pioneers like Kelly and Burnham, Schmitz and Janeway,[8] to mention but some of your own distinguished contributors. A study of the international reports reveals the wide divergence of results achieved in different clinics. As seen in figure 1, with one exception there has been an encouraging and progressive improvement in the overall collected world results during recent years, with a recovery rate in the latest five year series of 39.8 per cent. Compared with the position in 1898, when the first Wertheim was performed, the results are good, but there is no room for complacency when one remembers the 60 per cent who still die in the best centers, the 70 to 75 per cent who die in many teaching centers and the probable mortality in thousands of units which never publish results.

Four Questions

As we consider these things we are confronted by four direct questions which for too long have remained unanswered:

1. Why are results so much better in some units than in others?
2. What are the causes of death in treated cases?
3. Can the incidence of these causes be reduced or eliminated?
4. What should be the plan for the future?

Question 1:

The first question is easily answered. The large center with highly skilled specialist staff, equipment to match, and an adequate records and follow-up system, will almost invariably achieve better results than the small unit with limited experience and facilities. In Great Britain, units handling less than 750 cancer cases of all varieties annually will probably cease to exist and the more expensive and efficient apparatus will be concentrated in clinics handling at least double this number.

Another factor essential to improved results is to increase the proportion of early cases. The international report records an average 63 per cent five year recovery rate with stage 1 growths as opposed to 8 per cent in stage 4. Thanks to the excellent pioneer work done in America, increasing use of vaginal cytology helps the detection of early cancer in two ways. It selects the suspect patient for further investigation and

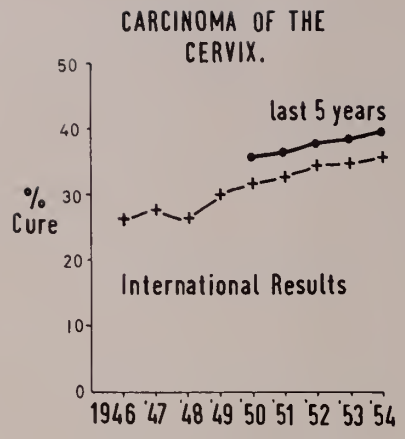

Fig. 1. Illustrating steady improvement in world results.

makes all concerned, medical and lay public, more cervix conscious. Centers associated with educational programs and screening facilities will handle more earily cases and have better overall results.

Question 2:

There are several reasons why 60 to 70 per cent of all treated cases die within five years. The minority have cancer so advanced that cure is improbable or if it occurs the renal tract is already so disorganized that uremia is a constant hazard. Some have growths that do not respond to radiation or are highly malignant and rapidly and widely disseminate. A few die as a result of treatment, both surgical and radiation. Others respond but later suffer recurrence locally, or new tumors develop in an organ which has already demonstrated its malignant potential. Many are killed, often years later, by glandular or other metatases.

Question 3:

Attre working in different countries in the early thirties in three clinics using radium as the sole attack on cervical cancer, I was worried by the facts just recorded. In 1936-37 it was my privilege at Chelsea Hospital for Women to learn the Wertheim technique from such masters as Bonney, Rivett, Read and others, but it was obvious that although glands were involved, even in early cases the Wertheim operation was not the ultimate answer to the problem. The best results were comparable to the best by radiation, but were not good enough. It seemed possible that the hope for the future might lie in a combination of both methods, full radiation followed by the Bonney-Wertheim operation. This appeared to offer as a justifiable experiment the chance of reducing the number of deaths from resistant tumors, from recurrent or new uterine cancer, and from gland metastases.

The most efficient block dissection of glands anywhere in the body is an unsatisfactory procedure when one imagines microscopic malignant cells remaining in the field in invisible or divided lymphatics, but it was thought possible that deep therapy inadequate to sterilize pelvic wall glands might be lethal to scattered cells. It was therefore planned to give deep therapy postoperatively if glands were involved. At this time I was unaware that Schlink of Sydney, to whom I have already referred, had embarked on a similar program some years before. His excellent work is now widely known. It has been my privilege to visit Sydney and work as a visiting professor in his clinic and I can vouch for the thoroughness of his treatment, for the excellence of his follow-up system and the accuracy of his records.

In 1937 and 1938, however, it was not easy to obtain support in Britain for the scheme outlined. Most schools were using radium. Those employing surgery criticised the wisdom of operating after extensive radiation. Permission to carry out this treatment was refused in a unit in which I then worked as an assistant, and not until later did the opportunity come of putting these ideas into practice. What the results will be in a series large enough to warrant the drawing of conclusions has yet to be decided, but much has been learned from experience to date.

In the first place, operative difficulties are not increased if the correct time interval following radiation is chosen. This has proved to be six weeks after the first application of radium. The immediate reaction appears to decrease after each application and the increased bleeding which was prophesied by many does not occur. Neither has postradiation fibrosis developed. It has been the exception and not the rule to require blood replacement during operation although a slowly running transfusion is a wise precaution. Two important practical points require empahsis: the first is that if blood is lost it must be replaced but with careful technique and spinal anesthesia, as advised by Bonney, hemorrhage should be minimal. The second point on an appreciation of which the life of the patient may depend, is that excessive transfus-

ion or infusion can be fatal. Nice judgment is often required to decide how much fluid is necessary and how fast it should be given.

Multiple fistulae predicted by the sceptics have not occurred and no ureter has necrosed or been cut in the series. Two patients developed delayed bladder and rectal necrosis with fistulae formation and in each case it was found that the maximum agreed radiation dose had been exceeded prior to operation. The fistulae were closed vaginally in both cases. One other patient developed delayed small vesico-vaginal fistula which was successfully closed.

Figure 2 illustrates the extent of the tissue removed with a stage 2 carcinoma involving the vaginal vault. There is no technical difficulty

Fig. 2. Postradiation Wertheim specimen with vagina opened to reveal healed cervix.

in removing all the vagina when necessary. Early in the series, patients for operation were selected carefully, but in recent years the procedure has become a routine on all patients under 70 considered operable after the second application of radium. The operability rate last year was 60 per cent of all cases seen and 71 per cent of all patients under 70.* There has been no operative or postoperative death in the series. There has, however, been one postoperative death from embolism in a much smaller series of postradiation Wertheims for carcinoma corpus et endocervicitis. The number of carcinoma of cervix patients treated in this way is 122 to date.

Radium and Surgery Used Together

An interesting feature, the significance of which we do not as yet understand, is the reduced incidence of gland involvement since radiation has been controlled by a skilled radiotherapist. Previously the surgeon applied the radium, now both surgeon and radiotherapist work together in the theater. Dr. Ellis, Director of the Radiotherapy Department at Oxford, uses a perspex spreader applicator of his own design (fig. 3) which holds the radium in the distended

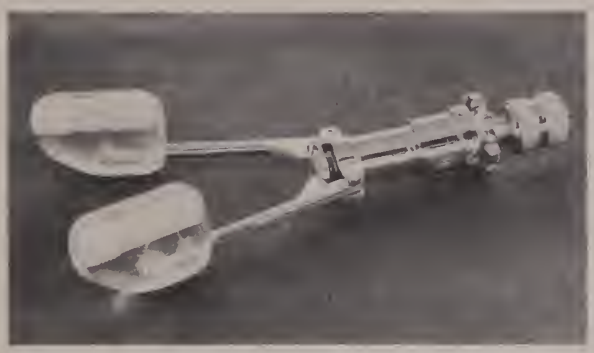

Fig. 3. Perspex vaginal spreader for radium application.

lateral fornix as near the lateral pelvic wall as possible. Only 3 of the last 34 patients had gland metastases. Currie reported 181 operations following a reduced dose of pre-operative radium in a total of 214 operations with only 3 deaths, all from emboli.[11] Glands were involved in 30 per cent and cancer cells were found in the removed cervix in 78 per cent. After full radiation we are finding glands in approximately 10 per cent and residual cervical cancer cells are seldom seen. The time interval and heavier radiation explain the decreased incidence of residual malignant cells and it is attractive to believe that they also have some effect on gland involvement, but this has still to be proven.

An important point illustrated by Currie's excellent results, those reported on selected cases by Meigs, the Sydney series of Schlink and the Oxford figures, is that careful teamwork can produce results considered impossible 20 years ago. Fletcher-Shaw[12] addressed the clinical Congress of the American College of Surgeons at Philadelphia on the subject of radium and hysterectomy in 1936. He reported his experience of 154 operations with a primary mortality of 21.4 per cent as opposed to 2.1 per cent following radium, stressed the need for surgical experience for those performing the operation, and announced that as a previously strong advocate of surgery, he had now abandoned it. The best that could be expected by operating on selected early cases was in his opinion a 40 per cent five year survival rate. In the subsequent

*The percentage of patients operated upon will continue to rise with progressive earlier diagnosis due to cytologic screening, colposcopic studies, and better education of the public and profession alike.

discussion, Floyd Keene of Philadelphia concurred with Shaw's conclusions and stated that no hysterectomy for cervical cancer had been performed in his clinic for 15 years.

Currie's results of 79 per cent five and 77 per cent ten year survival in selected cases and the experience of Schlink, Meigs and at Oxford, give ample proof that these views and those generally held today are unnecessarily gloomy. It will be said that these results are from selected clinics and not generally applicable, so let me return to the words of Keene when he discussed Shaw's paper 22 years ago, "Irrespective of the method employed and under the most favorable circumstances as regards technical skill and equipment not more than 25 per cent of patients can be saved. With such deplorable results it is evident that the treatment of cervical cancer is not a closed book, but an issue requiring a receptive mind, willing to give serious consideration to any procedure which is based upon sound scientific principles." The prognosis has improved 100 per cent since those words were spoken, but the need for an open mind is as valid today as it was then.

Before a brief concluding glimpse into the future, passing reference must be made to the subject of corpus carcinoma. Just as there has been undue pessimism about the results of treatment of cervical cancer, there has been unwarranted optimism concerning carcinoma of the corpus. The best five year results assessed on all patients seen have been approximately 60 per cent, while many clinics report 40 to 50 per cent. It is now more widely recognized that even in cancer confined to the corpus the pelvic glands are involved in over 10 per cent, and with extension to the endo-cervix the incidence is higher. In face of these facts the usually adopted surgical procedure of total hysterectomy is almost as inadequate as the same operation would be for cancer of the cervix. The extended operation needs more experience and better teamwork and as with carcinoma of the cervix, both radium and surgery have an important role. To what extent each should contribute has still to be decided.

Question 4:
